Interface
Magazine

THE COMPLETE COLLECTION

Every issue of Atari Interface Magazine

Version 1.0
Built from scans by many members of the Atari community
Compiled by Kay Savetz

Atari Interface was published from January 1989 through March 1993 by Unicorn Publications of Ann Arbor, MI. It was a monthly magazine that served as the newsletter of several independent Atari users groups.

The pages in this PDF were scanned by many members of the worldwide Atari community over a period of years. Thanks to AtariMania.com, AtariCompendium.com, scottithgames, and Internet Archive.

I believe this is every issue that was published, though it’s possible there was also July 1991 issue. If you have a copy or a scan of it, please let me know at kay@savetz.com.

MUZAP

An AUDIO/VIDEO Game!
A MUSIC Learning Station!

For the ATARI 520ST & 1040ST
Color or Monochrome Monitor

MUZAP combines the entertainment aspect of the game program with the learning process of the educational one.

The object of **MUZAP** is to **ZAP** musical notes before they **ZAP** you and, in the process of playing, improve your skills in musical notation and cultivate your musical ear.

MUZAP is a collection of games, each complete in itself. **MUZAP** teaches music while you're having fun.

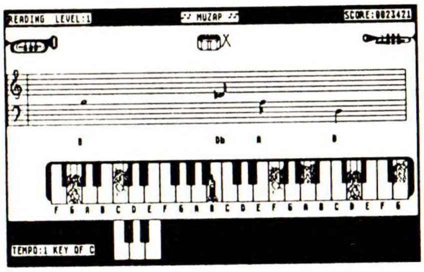
Mouse Driven Piano

In all the **MUZAP** games notes are **ZAPPED** using a mouse driven piano keyboard.

The little rocket moves on the displayed piano keyboard using the mouse until it is on the appropriate key of the piano and then click to **ZAP** the note.

Multi-Level

MUZAP includes different levels, different tempos and different keys. **MUZAP** is for all types of players, young and old, musicians and non-musicians alike.

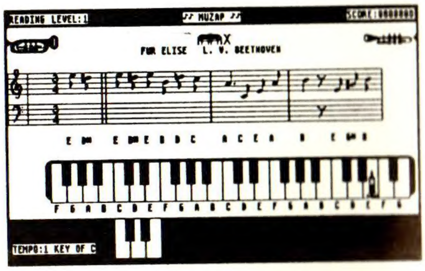


READ AND PLAY

The two main games, **SPEED READING** and **EAR TRAINING**, exploit the theory and experience of music. In the first, the player determines the pitch of a note from its proper position on the staff (i.e. musical notation), while in the second, the player finds the pitch from the tone of the sound (i.e. musical dictation).

Both these games can be played using either a **Random Note Generator**, for the rudiments of musical theory, or a **Melody Generator** for the experience of playing music.

The **Random Note Generator** is an arcade type game which values speed and dexterity. The user must quickly **ZAP** the traveling notes and sounds before they crash onto the piano keyboard, leaving cracked keys.



LEARN A MELODY

The **Melody Generator** provides 50 melodies, ranging from simple children's and Christmas songs to more complex classical pieces. Here the player must reproduce the melody correctly, respecting the duration of each note.

The score will reflect the player's performance and scores can be saved for a number of players.

Languages

MUZAP comes with manuals both in French and English, and either language can be selected on the menu.

Editorial Ramblings

Welcome to the first issue of Atari Interface Magazine. We're pleased to introduce this publication which is dedicated to Atari users in general, and specifically, to the many Michigan User Groups who participate with this publication.

Our publication of AIM marks the end of the Michigan Atari Magazine, which is no longer published. In the publication's expansion beyond the borders of Michigan, it's only natural the name should reflect this change. Since January is the beginning of a new year, we thought it a fitting time to introduce our new magazine.

You may notice in this issue the names of Donavan Vicha and Bob Woolley. Bob Woolley has written an article for us detailing his experiences with the XF551. He is the editor of the SLCC Journal for the San Leandro, CA User Group. Donavan Vicha is a contributing author submitting articles he originally intended for ST Applications, a now defunct ST publication. We hope to bring you many more articles from Donavan in future issues. We also have a review of SuperBase Professional written by CIS Atari SysOp Dave Groves.

Besides the articles from Donavan, Dave and Bob, we have reviews of News Room, Heroes of the Lance and Street Fighter, an update on the latest version of NeoDesk, a review of an alternative operating system for the 8bit, a hardware modification article from Don Neff on how to install three separate operating systems into your 130XE, plus the rest of Keith Joins article on the SpartaDOS X Cartridge.

We'd like to take this opportunity to congratulate Keith Joins of MACE for his recent appointment as a SysOp in the Atari8 Forum of CompuServe. If you have an account on CIS, you may wish to drop in each Sunday night at 9 p.m. (Eastern) and chat with him in a weekly informal conference. CIS also has a weekly informal conference in the Atari Arts (ST) Forum each Thursday night at 10 p.m. (Eastern). Hope to see you there.

We hope everyone had a safe and pleasant holiday season, and wish all our readers a very happy, peaceful and prosperous new year.

Bill & Pattie Rayl

People Who Make It All Possible

Managing Editor: Patricia Snyder-Rayl
Editor: Bill Rayl
Art Work & Comic Strip: Steve Volker
Photography: Bob Retelle
Contributors: Asti, Ted Beauchamp, Bill Boles, Dave Groves, Keith Joins, Jeff Kyle, Don Neff, Clinton Pierce, Donavan Vicha, Steve Voker, Bob Woolley, and all the participating clubs.

What We Are

The Atari Interface Magazine is a monthly magazine which also serves as the official newsletter of several independent Atari User Groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. For advertising information, please call (313) 973-8825.

Authors: When submitting articles, please provide both printed and magnetic form when possible. Atari Writer/ST Writer or ASCII preferred. Submissions may be uploaded to the Treasure CheST BBS, (313) 973-9137 (3/12/2400 baud). Deadline is the 17th of each month for inclusion in the following month's issue.

Subscription Information

A subscription to AIM is included in membership in any participating club or from Unicorn Publications for $18 for 12 issues. Add $8 for Canadian and $10 for foreign subscriptions.

Please include information concerning your computer hardware and experience and name of User Group(s) to which you belong. Make checks/money orders payable to Unicorn Publications. For User Group discount subscription rates, please write or call.

It's Not Our Fault

AIM does not knowingly reprint copyrighted material without obtaining permission from the source. Non-commercial User Group publications are granted permission to reprint articles from this magazine, provided credit is given to AIM, the author and respective club (when applicable).

Opinions expressed within articles printed in AIM are solely the views and responsibility of the authors and do not necessarily represent the opinions of AIM or of any partcipating group. Atari, the Fuji symbol and names of various Atari computers are trademarks of Atari Corp.

AIM is produced with a modified 520ST, Timeworks' Publisher ST, Easy-Draw/Easy-Tools and a Hewlett Packard LaserJet Series II printer.

From the Reader's Viewpoint

From John Nagy, CHAOS Newsletter Coordinator and former publisher of MAM

I am pleased to hear Bill and Pattie Rayl have seen the wisdom of christening a new entity. This will end disputes and clarify the status of Atari Interface Magazine as a wholly-owned commercial venture of Unicorn Publications and not a user group publication. User groups will appear in AIM, but it is as customers, not as owners or operators.

While the change in magazine identity closes a number of issues recently addressed in the MAM December Editor's column, a response is still required. From my involvement as founder and first publisher of Michigan Atari Magazine, I am able to respond about several matters.

Bill and Pattie begin their editorial with a statement "after being approached by John Nagy to take over publication of MAM, we informed him we would only take the magazine if the publication could be produced independently from the clubs." This statement is dually misleading. I did not approach the Rayls, and their intentions were never stated as neatly as this. The Rayls were among a group that met at the September, 1987 Detroit Atarifest, where we all discussed newsletters and MAM. I had produced MAM for over a year and mentioned I hoped not to past an additional year. Bill and Pattie produced a newsletter for WAUG, showed interest in taking on MAM, but said that they wanted it sooner if they were going to do it. Additionally, they assured me if they did MAM, several Detroit clubs would join it, something I believed was a very positive thing (and MACE and GLASS indeed did join later).

The Rayls also made it clear that they wished to publish MAM as a commercial venture. I had no problem with that, as long as the clubs were happy and knew what they were getting into. The clubs could certainly contract with the Rayls for publishing work if they wanted to.

After extensive talks, I decided to encourage the clubs to take the offer being made by the Rayls, rather than wait and perhaps not get as qualified or motivated candidates later. Bill and Pattie made a tour of several clubs, promising timely delivery of the magazine, higher quality for the current price and a bigger circulation. Little was said about rights or authority and even less was said about ownership.

Shortly before November, 1987, I received a letter from the Rayls' attorney, asking me to sign a bill of sale transferring ownership of the name Michigan Atari Magazine to Unicorn Publications. I immediately called both the attorney and the Rayls to explain my view that MAM was a co-operative publication, owned by the clubs jointly, and that I had absolutely no ownership to sell or give away. I explained that it was my expectation that the clubs would want to keep it that way, but any transfer that might be negotiated would have to be by agreement with EACH of the clubs. I supplied no letter purporting to transfer any portion or share of ownership of MAM to anyone, and to my knowledge, the Rayls never again discussed their obtaining ownership from any club.

My initial intention in drafting the proposal, printed last month, was to reach an end to the ownership question. The Rayls (who claim not to take well to ultimatums) stated they would NOT continue to produce their publication if control or authority of any kind was reserved by the clubs. The proposal would transfer unconditional ownership to the Rayls, who would in turn allow the clubs to form a committee with advisory power. My document included a set of premises and positions summarizing the discussions at the October meeting, followed by the proposal itself. Bill and Pattie chose not to include the support information in MAM, and as a result, the proposal looked quite foolish. [Ed: The text of the proposal itself was promised to be printed for discussion, not the editorializing accompanying it.]

I took personal offense to the statement saying I called Bill and Pattie after the proposal was drawn up and, out of the blue, "John stated that he felt he could no longer support the proposal, but he gave no reasons as to why." The principal reason I withdrew my support of the proposal was it was based on an assumption of good faith efforts to reach a co-operative resolution, with honesty and candor being pivotal to its operation.

The Rayls had made efforts to enlist out-of-Michigan clubs as MAM member groups. While this is certainly not offensive in itself, Pattie had volunteered to outside groups' officers that the name of the magazine would "of course" be changed as soon as the first outside group was added. Although outside groups have yet to respond to the offer, the plans, indeed the committments to change the makeup and name of MAM were never mentioned at the committe meeting.

Quickly attending to some last details: • absolutely no clubs from Michigan ever were turned away from MAM while I was publisher.

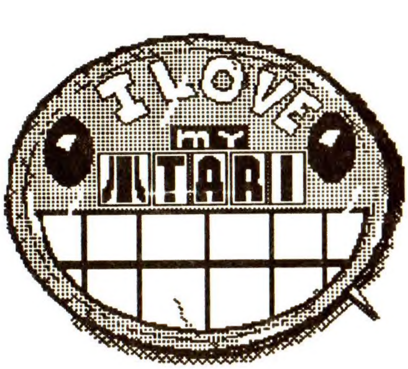
• On the (two) occasions when a non-Michigan club inquired about affiliation, it was indeed brought to Presidents of participating clubs for a decision (to remain all-Michigan).

• When people (all four) asked to subscribe to MAM directly, they were indeed "funneled" to CHAOS as members instead. I encouraged interested readers to take a membership in ANY of the clubs rather than to involve me in subscriptions (and have to keep my own database and mailing label support!). It obviously worked, as all the clubs gathered long-distance membership during my publishing. Additionally, CHAOS had regularly supported and donated money when it was necessary for the magazine, and they had far better facilities to keep track of the four wayward subscribers that didn't take the hint. Now, the Rayls promote direct subscription in competition with membership in the clubs, and clain that non-club circulation is equal in number to those getting it through a club membership. Which proceedure is better? I don't know, but the editorial's implication that mine was dishonest was offensive and uncalled for. [Ed: Concerning our non-club circulation, Mr. Nagy's comments are misleading. The facts are that we have only three in-state subscribers and less than 20 subscribers total. The majority of the non-club circulation figures come from store sales and exchanges with Atari User Groups. Though we do offer outside subcriptions, we no not PROMOTE those subscriptions to the detriment of the clubs. In fact, in the Feb. '88 issue of the Michigan Atari Magazine (in response to Leo Sell) we stated that readers "can get the magazine cheaper by joining a club (plus lots more benefits, too!). That never changed for the year we produced MAM.]

A matter of concern that has not yet been discussed is that of the new commercial status of the magazine and how it impacts the use of reprinted material. All of the news delivered via the national telecommunications services and much of the material in exchange newsletters is permitted for reprinting only by non-profit or club newsletters. As the Rayls' effort is no longer in that category, use of this material may either be barred or given by some mistaken impression that AIM is a user-group owned publication. [Ed: Material is unprintable only if a publication does not first obtain permission. This does not mean AIM cannot reprint articles. In fact, CIS and Delphi make no restrictions on reprinting of news items and many articles state they may be reprinted (by ANY publication) so long as the copyright notice is intact in the reprint. However, we don't often have a need to reprint articles since we have such a wealth of original articles that equals or exceeds the quality to be found elsewhere.]

I sincerely hope that the Rayls' new venture, AIM will put disputes behind us and wish AIM the best of luck regardless of whether my own club chooses to be included in the new venture.

[Ed: Rather than comment further on this matter, we would rather let this issue come to a close.]



Atari News and Comment

by Bill Rayl

Welcome to 1989, the year Atari promises to take the US market by storm.

Positive Signs

There have been some very positive signs in the past few months which indicate Atari may well keep this promise. Though next to no national product advertising is being done for the 8bit or ST computers, Atari's co-op dealer advertising has been seen in New York, Michigan, Florida, California and elsewhere. There have even been television ads for the ST and Mega line in the Oklahoma City area. In fact, it seems that advertising in the New York Times has enlisted a few new dealers in that area. Many stores are also reporting that they are now getting shipments of 1040STs and Atari has been filling orders for 520STs and Megas.

Atari is also showing some healthy funding for research and development, with R&D funding equal to or exceeding the days that produced the ST computer.

Atari Stock Watch

After falling to $4.875 per share in Mid-November, Atari stock is quickly making a healthy comeback and is now hovering around $6 a share. On the day of this writing, ATC stock closed at a price of $5.75 with 42,000 shares traded.

The Federated Albatross

Atari's prediction at the start of 1988 was Federated would be breakeven by year's end. Unfortunately, Atari has not been doing well in the prediction department (I wonder who runs that division of Atari, anyway :->). Federated posted a loss of $9 million, prompting many observers to speculate if something is not done soon, the Federated chain may drag Atari down with it. Perhaps "Federated ball and chain" would be more appropriate?

COMDEX

Atari, accompanied by a plethorum of third-party developers, filled with 6,000 square-foot Gold Room at the COMDEX show held in Las Vegas. Contrary to expectations, Atari did not show a 68030 machine (though Atari is saying such a machine will be available in mid-1989) and the Atari Laptop (nicknamed STacey), was shown only briefly in the Gold Room. (Reports are it took two people to carry it in!)

Even with these "minuses," Atari had a very good showing at COMDEX thanks to the third-party developers showing everything from a hand-held scanner and OCR (optical character recognition) software for the Spectre 128 Macintosh emulator. Atari had its a few things to show as well, such as the DeskSet II DTP program allowing use of CompuGraphic typesetters with the ST and UltraScript, the Postscript clone for the Atari Laser. The Atari Work Station (ATW, formerly the ABAQ) and PC clones, PC1 to PC5, were shown. In addition, Fleetwood Mac drew in lots of spectators to the Atari booth with their performance, showing off, in part, the MIDI abilities of the ST.

Toronto Atari Show, Nov. 5

Just one week before COMDEX, the Toronto Atari Federation sponsored the first Canadian user group AtariFest. Atari Canada was present with a well-staffed and excellent booth highlighting the history of Atari. A few highlights of the show included Gribnif Software showing version 2.0 of NeoDesk, CodeHead Software selling G+Plus and MultiDesk (once the airline found their luggage!) and an educational game called MuZap from Philos Software, which was reviewed in the December issue of MAM.

Darek Mihocka hosted a seminar in which he demonstrated his Xformer 8bit emulator for the ST. With a cable recently designed by Darek, ST owners can now use 8bit SIO hardware directly. I purchased one of these cables, and Darek's newest version of XFormer, and I'm impressed! The cable works beautifully and the software has a built-in Degas screen shot feature (designed as an aid for Darek, but great for editors!).

There was much, much more to see from Regent Software, Sierra On-line, Joppa computers, Saved by Technology and others. User groups were well-represented at the show, with groups from Toronto, London and Kitchner, Ontario. PACE from Pittsburg, PA and GAG from Flint, MI also had booths at the show.

Unfortunately, the show had very little for the 8bit Atarian as far as developers. USA Media showed Celebrity Cookbook and the Diamond OS for Atari 8bits.

Graphic OS updates

For those of you who have been following the development of ST-like environments for the 8bit Ataris, here's the latest info! USA Media, formerly Merrill Ward, has gone through yet another change of name, this time to Merrill Software. At last report, Merrill Software was still marketing Diamond by Alan Reeve.

On the GOE Cartridge front, David Sullivan is shipping the first batch of cartridges as I write this. When we spoke to him, David had just received the manuals, and the cartridges were already in the hands of the distributor.

Add a 720K 3.5" Drive to Your 8Bit

In his many hacks into the XF551, Bob Woolley of the San Leandro Computer Club in California has come up with a modification allowing XF551 owners to use single or double-sided 3.5" drives. The modification requires reprogramming of the ROMS inside the drive, but a kit is available from Innovative Concepts (IC) in Warren, MI that gives you everything you need (modified ROM, adapting cables and step-by-step instructions) for only $34.95 (plus $3 s&h, MI residents add 4% sales tax). The kit even allows you to use either the original XF551 drive or the 3.5" at the flip of a switch. And, best of all, Bob Woolley gets royalties from each kit sold! IC also offers complete installation for those not "hardwarely" inclined. You can contact IC at (313) 293-0730 or CompuServe, 76004,1764, for more information.

On-line ST Magazines

The on-line publication ST Report is no longer affiliated with APE, Inc., publisher of the 8bit on-line magazine Zmag. Ralph Mariano, publisher of ST Report, said the split was friendly. ST Report has begun reporting on the Amiga, IBM and Unix worlds in the new CPU Report section.

ST Profile, another on-line ST magazine produced by GEnie RoundTable staff, has been gaining praise from its readers. Featuring original articles from a wide variety of authors, ST Profile looks to be a real winner.

GFA on the Move,

GFA, the German-based company that produced GFA BASIC has recently announced they will no longer be marketing their products through Michtron of Pontiac, MI. It seems, from recent reports, that Antic Software has become the new distributor. Michtron has stated they will continue to support GFA BASIC on GEnie, as well as their new Hi-Soft and Power BASIC packages. Hi-Soft, and its lowend counterpart Power BASIC, are packages giving compatibility with MS-DOS BASIC. Looks like the BASIC market for the ST may be heating up again!

Games to Start the New Year Off Right

Just when you thought it was safe to go back in the dungeon, FTL releases "Chaos Strikes Back," the long-awaited sequel to Dungeon Master. In Chaos Strikes Back, your party of adventurers are called on again to battle the nasties. A spokesperson for FTL stated the game should begin shipping after the first of the year. Unlike the multiple levels in Dungeon Master, FTL is describing the layout of the game as "octopus-like."

Want Color For Under $100?

Unlock the Power

VIDEOKEY

RGB to color composite converter for the Atari ST

With VideoKey, now you, too, can experience the fantastic color and sound of Atari's games and graphics on any television, big screen or composite monitor! Its design provides the highest quality color composite video and RF output possible for any Atari ST, not just those that are RF equipped. Standard RCA jacks allow for easy hook-up. Optimized for low resolution use.

Practical Solutions
1930 E. Grant Rd., Tucson, AZ 85719

MasterCard 602-884-9612 VISA

For 520ST, 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.
Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A:Socketed, no RAM	$ 129
520B: 1 MB, socketed	$ 299
520C: 2.5 MB, socketed	$ 595
520D: 4MB	$ 995
520-1:1 MB, non-expandable	$ 249
1040A: 1 Bank sockets, no RAM	$ 110
1040B: Fully socketed, no RAM	$ 149
1040C:2.5 MB + 1 bank sockets	$ 595
1040D: 4 MB	$ 995
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 12-19-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.
Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available!
Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Inside the XF551 Disk Drive

by Bob Woolley

It has been almost a year since I first got my hands on an XF551. Busy little hands...

Of course, the first thing I did was to tear the thing apart to see how it was put together. And, maybe do a little "put"ing myself. As a result, I have made a few modifications that may be of interest to other XF551 owners. You will not be able to successfully make these changes unless you have reasonably decent electronic skills, so don't gamble with your new XF551 unless you know what you are doing. Most User Groups have skilled members that will be happy to guide you if you need help.

First, a few facts

But, before I get caught up in details of the drive, I would like to clarify some points on the XF551. The drive IS double sided and can read and write in single, enhanced or double density. The "book" that comes with the drive is incorrect. MyDOS, SuperDOS and SpartaDOS can all format the drive as double sided and double density.

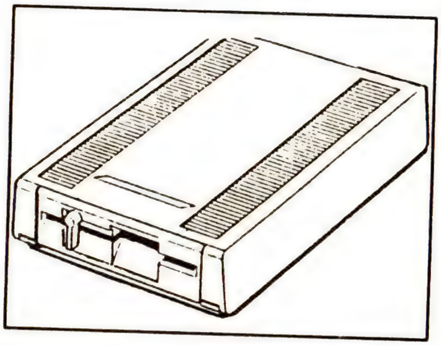
Previous Atari drives did not use the INDEX hole on the diskette, which allowed us to flip the disk over and format the back of the media. The XF551 uses a standard, bone stock, IBM style drive. It uses INDEX. It will not FORMAT the back of a diskette unless the disk jacket has two index holes. It WILL read and write to the back of any disk. Guaranteed! On side one, the tracks on the disk are written from the outer edge in, from 0 to 39. On side two, the tracks are written from the inner edge out. This allows us to read the first 40 tracks of a DSDD diskette on a SSDD drive. The second side is not backwards nor could it be read on a SS drive even if you changed it.

The speed of the drive is NOT 288 RPM, the speed you are used to seeing, but 300 RPM, the industry standard. The XF551 compensates for the difference by using a clock frequency 4% (.33mhz) higher than it should be. This will read and write the data in exactly the same place on the diskette as your 288 RPM drive, although programs that measure the speed of the drive will read 300 RPM.

Talking To The Drive

The XF551, as it comes from Atari, has the ability to format a diskette in any of three configurations: single density (SSSD-88K), 1050 density (SSED-127K) and double-sided, double density (DSDD-360K).

The DSDD format has a standard skew (skew is the physical sequence of the sectors on the disk) and a high speed skew option available to the user. This extra skew layout allows faster data transfers on the SIO buss, much like the ICD Doubler upgrade on the 1050. For those of you interested in programming, the DSDD format SIO command is $23. For a high speed skew format in DSDD, you just need to turn on bit 7 for a value of $A3 (the SSSD and SSED formats do not have a high speed skew, although the drive will transfer data at high speed in those densities).



Having 360K is nice. Having 720K is even nicer. Putting a 720K, 3.5 inch drive in place of the stock drives is not too hard.

To transmit data at high speed to and from the XF551, just set bit 7 of the command to "1" again (a get sector ($52) with bit 7 on is $D2). You must still send the command frame at the normal SIO rate ($28 in $D204) and then set $D204 to $10 for high speed operation during the data frame. The drive will also recognize the Put (and Get) Option Table command ($4F and $4E), which are similar to the Percom configuration table operations. Only bytes 4-8 are changed by the Put command, however, and only the three supported formats will be recognized. Even if you sent the Option Table a 512 byte sector size, you would only get 256 byte sectors.

A number of the newest DOS versions (SpartaDOSX, SuperDOS 5.0, DOSXE...) now have XF551 support built in. Also, a file is available in Atari8 on CompuServe that will modify SpartaDOS 3.2D for the XF551 features (in DL3 - XF32D.BAS). Using any of these methods will transfer data almost twice as fast as DOS 2.0.

Into The Hardware.

The first thing you notice about the ICs in the drive is the one in a nice socket, the ROM. Makes it a lot easier to burn an EPROM (use a 2764) to make code change if you can just plug and unplug your devices. I didn't see the ROM source code printed anywhere, so I wrote a simple disassembler for the 8050 MPU used as the brains of the drive.

It was very nice when Atari used a 6507 (which uses 6502 OPCodes) in their drives but, no more. Everything Atari comes out with now seems to use a different chip and this 8050 stuff was a bear. Finally, I got most of the program logic worked out and designed some changes.

One upgrade that was available for the 1050 is a ROM change that will re-address the drive as D5: through D8:. This can be done on the XF551 ROM by altering location $0095 from $31 to $35 ($33 gives you a range of D3: to D6:, etc.).

Having 360K is nice. Having 720K is even nicer. Putting a 720K, 3.5 inch drive in place of the stock drive is not too hard, so let's start with the ROM. There is a little bug in the code that allows the drive to start writing the track before it has reached operating speed. To remedy that, change $528 from $90 to $00, $C1D from $88 to $80 and $E25 from $88 to $80.

The 720K drive has 80 tracks per side which requires you to change $680 from $28 to $50, $80F from $30 to $60 and $811 from $FD to $FA. A 3.5 inch drive uses a 3ms seek time — change $53D from $00 to $03, $57B from $18 to $13, $9D1 from $08 to $03, and $B15 from $18 to $13. Finally, the 3.5s use write pre-compensation — change $61D from $F6 to $F4, $621 from $F6 to $F4 and $D0D from $A2 to $A0.

For a drive, I used a unit from JDR Microdevices (MF353B Mitsubishi) that plugs right into the 5.25 connectors and uses the same mountings as the larger drive. This simplifies the installation quite a bit. When you go to plug in the 3.5, you may notice that the 34 pin cable is too short. I de-soldered the connector and added a longer cable, but one hacker, Joe Wyks, managed to pry the top off of the board connector and crimp his new cable into place without soldering. The power connector can be adapted with cables made for that purpose, if necessary.

That's about all that's needed to run a 720K 3.5. Format a disk using SpartaDOS XINIT, option 7 (DS 80 tracks) and start filling it up! You now have 2820 DD sectors.

Bob Woolley can be reached on CompuServe at [75126,3446] and is the editor of the SLCC Journal. We wish to warmly thank him for contributing this article and sharing his knowledge of the 8bit and the XF551 disk drive with us.

ASTI Talks About... The "ST Party"

I was talking with my cantankerous partner, the Dictator, about this month's article, and he wants to know why no-one ever has an "ST Party." What is an "ST Party" you ask? Well, it's no wonder you haven't heard about them, the Dictator invented them but failed to tell many people about them.

It all started back in September of 1985 when the Atari ST first came out. I was (proudly) the Dictators VERY FIRST computer, and a brand new model to boot! So, he didn't know where to go to get any information on how to use me or hear about the new software that was slooowly being released.

Well, after hanging around the store where he bought me (enough to be a free salesman and ST promoter), he managed to locate several other new owners. Not having a club or user group to go to, the Dictator invited these other owners to his home in groups of two and three (or more!) to share fun, information, opinions, news and experiences about the ST. After realizing what a good time could be had by all, a phone call to a few of these new friends about an "ST Party" soon turned into a weekly affair.

Now the Dictator is all-consumed by a user group, but the idea is still very valid for all of you to consider. How many times have you said to yourself or your ST friends that there is never enough time at the user group meetings? Try inviting a couple friends over for some ST time. Get to know some of the other user group members better and learn a lot about your machine.

The Dictator's parties included everything from game playing to programming and using business software. It's a great way to get a first-hand review and opinion. And two or more heads can explore a computer and it's hardware & software much better than one. Give it a try.

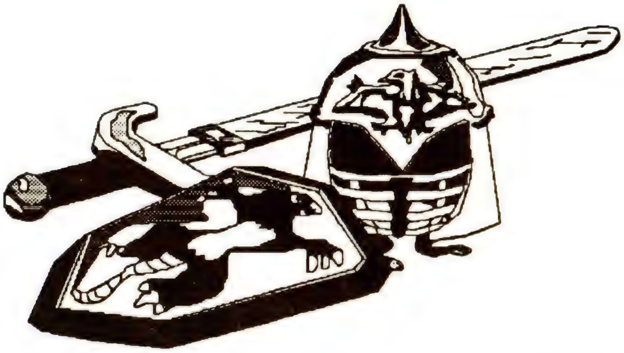
On another note, being cooped up here with the Dictator gets rather boring. It would be really nice if some of you could find the time to drop me a line and let me know I'm not talking to empty space. Ask questions, give opinions, tell about experiences, or just say "HI."

We all function better if we get a little feedback (or as one of my friends would say "need more input") to inspire us to continue.

Please write to:
ASTI & the Dictator
P.O. Box 99737 Troy, Mich. 48098
and I promise to answer all letters in this article.

ASTI (and the Dictator!)

Heroes of the Lance



by Steve Volker

When I select a game to buy, one of the primary motivations is great graphics. There are a lot of well thought-out, enjoyable games out there I never really consider because the pictures on the box or in the ads just don't thrill me. (Silly,huh?) So it was when I saw an ad for the fantasy game, Heroes of the Lance, by Strategic Simulations Inc and TSR, I just HAD to have it!

Besides the beautiful cover of a lanced warrior riding a majestic, fire-breathing dragon through the skies of Krynn, I was happy to see the familiar US Gold emblem displayed in the lower left corner of the package. (US Gold is the trademark of GO America Ltd., which has had a part in so many fantastic games of late — like DIVE BOMBER!) Inside were three disks, labeled A, B, C, and a 25-page, well put-together manual. I curbed my overwhelming desire to immediately boot the first disk, and actually READ the manual.

Heroes of the Lance is based on the TSR Dragonlance series of books and roll-playing games, and the first few pages gives an enticing overview of the history and basic plot of this, and where you are in this saga while playing the game. (I think I just decided to read the books.) Your nemesis is the Queen of Darkness herself and her Draconion minions, along with an ample mixture of giant spiders, wraiths, and several little known creatures from the Dragonlance saga,..oh, and of course the Dragons.

The manual goes on to describe your goals, (to recover the Disks of Mishakal and restore the waning faith in the gods), how to use the joystick during the normal game mode and in combat, (the ST version does not make use of the mouse — I tried!), and how to prepare your disks for play (involved). There is also a half-page description of each of the eight predesigned characters, you use in the game. Finally, time to BOOT THE FIRST DISK!

One of the disadvantages of all great graphics games, is the time it takes to finish loading, but to my money — it was worth it! Wow! The title screen is a...well, it's enough to remind you why you're an Atari ST owner. Oh, and there's more! After this comes a portrait and mini-description of each of the primary "players," (each is a beautiful, colorful rendition of the original Larry Elmore paintings for the Dragonlance Series), and all are worth just enjoying. Then comes the copy-protect section.

I have a few impressions of the way in which SSI protects this program. First, I applaud the fact there is NO copy protection on the disks themselves. We've all known there were better ways to discourage pirating, and SSI may have found one. Second, to get past this you must find a key bit of information in the manual about a character or whatever, and key it in to continue with the game. I purposely made a typing error during this process, and found it unforgiving — causing you to reboot to try again, but my main problem with this is that whenever you die, regardless of whether you have saved a game or not, you must go through this (and a reboot) to start on your adventure again. This is frustrating and takes a lot away from the playability of the game (especially if you play like I do). It is surprisingly easy to lose all eight characters in the first TEN minutes!

After entering the main program, and getting used to the joystick controls and general lay-of-the-land, the actual play is easy, stimulating, and gives you quite a few options. Anything outside of movement and combat, are done by scroll-down menus you can reach by pressing any key. Some options are: run, dodge, jump, use range weapon, take, and actual close combat. There is also a good measure of magics used by either side. Oh, and the way some of the creatures die, crumbling to dust, exploding, etc., is something to watch. From here you continue to fight, explore and gain experience, until you've found the secret to killing Khisanth, the ancient and terrible black dragon, and recovering the Mishakal disks (which you also have to find!). Along the way are potions, magic staffs, exotic rings, and miles of tunnels and rooms to explore.

When all is considered, I found the game to be interesting and stimulating, with my favorite part being the startling graphics. Though somewhat too arcade style for me, I appreciated the detail and continuity of the story, and the ease of play. I think you'll find it worth looking into.

Heroes of the Lance comes on three, single-sided disks. It requires a color monitor, (or TV for the FM crowd) and will run on a 512K system. Though it is published by Strategic Simulations, 1046 N Rengtorff Ave., Mountain View, CA 94043,(415) 964-1353, there is a note in the December 88 issue of START that ordering should be done through Electronic Arts, at the number 1-800-245-4525.

The SpartaDOS X Cartridge

by Keith Joins (MACE)

[Editors' Note: We continue with the second half of Keith's SpartaDOS X Cartridge review. See the December issue of the Michigan Atari Magazine for the first half.]

Several other environmental variables are available that you can set with the SET command. One of these is the DOS prompt. You can specify the format of your prompt by using certain "meta" characters. The letters L, N, P, D, T, and R, preceded by a dollar sign, will be replaced by the drive Letter or Number, the current directory Path, Date, Time, or a Return. You can also use an underline, which will be replced by a space. For example, "SET PROMPT=$L:" will give you a prompt of A: for drive one. If you are in the GAMES directory on drive one, you could "SET PROMPT=T_DN :>$P>" and your prompt woud look something like this:

11:25:42am D1:>GAMES>

The normal Dn: prompt is set up with the command "SET PROMPT=D$N:".

PATH can be set to cause other directories to be searched when a command or file is not found in the current directory. Entering PATH with no parameters will show the current search path. Note: the search path is NOT the same as the current working directory!

To see what your current directory is, enter CWD (or CHDIR, or CD) with no parameters. This takes the place of the ?DIR command from earlier versions of SpartaDos.

The FORMAT command presents a menu type screen and allows you to format a disk in any density you want. You can use the high speed skew for the new XF551 drive, the US skew for the Indus or a doubled 1050, or a standard skew. You can format the disk in either Sparta-mode or Atari mode. Atari mode allows you to use enhanced density if you so desire. This formatting menu shows up whenever a format-disk command is issued — even from within a program!

The FIND command will search all connected drives and all directories for the specified filename. Wildcards are of course accepted. You can limit the search to one drive by including a drive number in the filename.

The keyboard buffer is not loaded as a default. You must select KEY ON to load the file from the cartridge and activate the buffer. Subsequent KEY commands will toggle the buffer off and on.

The LOAD command has the same effect in SDX as in the disk-based version of SpartaDos. This will load a file but not run it. However, you can also use it to load an external command file to keep it resident in memory. The COM files in the cartridge are loaded each time they are called. You could load one or more of them into memory with the LOAD command and they will stay there until you use LOAD with no parameters, which will remove all non-installed programs from memory.

The SWAP command will allow you to swap your drive configuration. SWAP 1,8 would swap drive one with drive 8. SWAP with no parameters will display the current drive map. MIO users should take note that the MIO menu swap configuration must be considered when using this command.

The X command is used to load and run those programs that require all cartridges be removed. Express, Determ, Textpro, Discom, and the disk-based ARC are examples of programs that must be called using the X command.

A couple of nice features are the PEEK and POKE commands. These work pretty much like the Basic commands except you don't need the comma to separate the address and the value in the POKE command. Also, you can enter the address and value as either decimal or $hex numbers. These two can come in very handy at times, believe me! For example, my AUTOEXEC.BAT file contains the commands POKE 82 0 and POKE $2DA 1 to set the left margin and cursor repeat rate as soon as the system is booted.

Another command that is nice is CLS for clear screen. This is good for some programs that exit to DOS leaving you with a screen full of the program remnants. There is also an RPM command, which allows you to easily check the speed of your disk drives. (The standard speed for an 810 or 1050 drive is 288 rpm. My Happy drive registers about 900 rpm, and an MIO ramdisk clocks in at around 23000!)

The next feature I will cover is one of the most impressive. SpartaDos X contains a licensed ARC program that will also handle Alf-Crunched files. Here is the format and commands used:

```
SpartaDOS X ARC ver 1.1
Usage: ARC cmd[opt] arcfn [flist]
```

Where "cmd" is one of: a : add file(s) to archive m : move file(s) to archive, then delete from current location u : update file(s) in archive, keeping the newest versions (according to the time/date stamp) and adding any source files from flist that aren't in the archive f : freshen file(s) in archive, keeping the newest versions but not adding any files that aren't already in the archive d : delete file(s) from archive x,e : extract file(s) from archive p : print file(s) to screen l : list file(s) in archive v : verbose list of file(s)

Valid "opt" options are:

b : retain backup copy of archive s : suppress compression w : suppress warning messages

n : suppress notes and comments h : high speed (screen off) g : encrypt/decrypt archive entry (followed by password - must be the last option, as in ARC AHGtwister TEST.ARC *.*)

"arcfn" is the archive filename (drive, path, and ext are optional).

"flist" is the list of files to extract, add, list, etc. in the archive. Wildcards are allowed in each filename. "*.*" is assumed if no filename is given.

This is a fully featured ARC as you can see, and works the same way as the ARC utilities for IBM and ARC.TTP for the ST. It is also extremely fast! The first time I used it to unarchive a file I thought it must not have worked properly since it finished so quickly.

The program will automatically determine whether a file is in ARC or Alf-Crunched format when extracting files, and when compressing will use the most efficient ARC format it can. Anyone who is a frequent downloader of programs that have been compressed will really like having this program always just a command away.

Most other commands remain the same as they were in the disk-based version of SpartaDos. Some have additional features such as DIR and TYPE. They can each accept some optional parameters. Remember the discussion of the ATR command? The Attributes can be included with these commands. DIR +S will show only subdirectories. DIR +H will show hidden files. You can also use a /P or /C. with DIR. DIR /P will pause the display and wait for a keypress after giving you a full screen of filenames. DIR /C will give you a count of the number of entries in that directory. DIR /PC will do both. TYPE can also use the Attributes and the /P. Also, TYPE is no longer limited to text files with 64-character lines. You can now TYPE any file to the screen.

PRINT has been dropped and the entire I/O re-direction scheme has been changed. Batch files are only read by the command processor and cannot input information into a Basic program since they are no longer system wide. You can divert output of a single command by using > such as DIR >PRN:. This would redirect the directory display of drive one from the screen to the printer. DIR >A:FILENAME would direct the display to the file on drive one. Similarly, you can use <A:FILENAME to specify input from a file instead of the keyboard.

As I already mentioned, SpartaDos X looks for a file called AUTOEXEC.BAT at boot rather than STARTUP.BAT. This batch file would include any system set up commands you need (like the POKEs mentioned above).

You can execute a batch file from the command processor with the -filename entry. You can also pass parameters to the batch file. As an example let's suppose that you have set up your MIO ramdisk as drive one but that you frequently want to change the file that you are using as your CONFIG.SYS. You have a floppy in drive two that has a library of CONFIG.SYS files named FILE1. FILE2, etc. Here is our batch file, named CHANGE.BAT:

```
COPY %1 %2 COLD
```

Now we would execute this batch file as follows:

```
-CHANGE B:FILE1 A:CONFIG.SYS
```

This would copy FILE1 from your library of CONFIG.SYS files in drive two to drive one and re-boot the system using the new CONFIG.SYS file.

This is not the best example in the world but it does give you an idea of what can be done. You may pass a total of nine parameters to the batch file.

While speaking of batch files and CONFIG.SYS files, a nice feature in creating and editing these files is that COPY CON: does not clear the screen as COPY E: does. You can TYPE the file out, issue a COPY CON: CONFIG.SYS, move the cursor to the display of the file and edit what you want while hitting RETURN after each line, and then press CONTROL-3 to close the file. This can be a real time saver when setting up various CONFIG.SYS files.

And now a note to TURBO BASIC users. You can now use TB with SpartaDos! However you will need an expanded memory system since you must load the handlers into BANKED memory. That will leave the RAM under the OS available to TB. While I haven't tried it, it might be possible to load the handlers into normal RAM and run TB on a stock XL but it would drastically reduce the memory available for any programs to use.

Well, this has been a brief overview of the SpartaDos X cartridge. In my opinion it is well worth the long wait. While there still could be bugs lurking around in SDX somewhere, if they are there they are extremely subtle. The only problem I can see will be the occasional program that is not compatible with SDX. In the course of beta testing we've found a few such programs, but ICD has quickly remedied this. If you discover a program that doesn't work, report it to ICD and use the disk-based version with it until the next upgrade.

Whatever you do, don't miss this one!

The NewsRoom by Springboard Software, Inc
Desktop Publishing for the 8bit

by Ted Beauchamp (TAG)

The NewsRoom is a desktop publishing program for the Atari 8bits with at least 64K and a 1050 compatible drive. The package consists of a main program disk and one clip art disk with over 600 different pieces of clip art.

The manual is 97 pages long including the 10 pages that show all the different pieces of art. This makes it very handy to find an appropriate picture to use. The pictures are grouped by subject into panels that have several different pictures to choose from. I think you could find a picture for almost any subject or occasion, but if you cannot there are other clip art disks available.

Enough about the clip art, after all this is supposed to be a publishing program. The main menu has five choices to pick from; the banner department, the copy desk, the photo lab, the press room, and the layout area. It seems that the programer wanted to give you a feel of the workings of a real newspaper.

The program is almost a simulation of a newspaper's creation from start to finish. As you write your story and create your pictures, they are divided into panels. An 8-1/2 X 11 Sheet will have a banner across the top and two columns of three panels or just two columns of four panels. As you save each panel, you should note the final order you want each to appear on your sheet or your story will be scattered all over the place. This does offer the advantage of inserting pictures or diagrams where you want them or of continuing stories on later pages if you are creating a multi-page paper.

The banner is the top portion of the page where the name of your paper will appear. To create this, you pick the clip art icon from the sub menu, find the name of the page you want from the directory displayed and pick the picture you want off the page. Then you position it on the banner layout and alter it if you want to using the crayon icon. This will put you into what is called the Graphic Art Tools menu. You can create your own picture, alter an existing one, fill areas, draw lines, circles, and boxes using different pen styles and erase any goofs.

The next step is to add the text using one of several fonts and sizes available. The banner is then saved to disk to be called back later. The photo lab operation is similar in use to the banner section except that you can create photos of any size up to a full panel large by making a box around the photo as large as you need. You can add a caption to the photo and use the same Graphics Tools to alter or create art work. When finished the photo must be saved to disk to be called back later at the layout desk.

The copy desk is where you write your stories. This is where I had the most problems. The text editor is not very good. You must first select a font, then you start to type, if you want to move the cursor it is done with the joystick before typing or the arrow keys after starting to type. The problem is the movement is too fast and erratic to allow for easy editing.

If the cursor is moved outside of the text, it changes to the pick up icon and moves more than one text line at a time. Moving back into the text causes it to jump several lines making it necessary to bring it back. The Delete key does not work unless you hold down the Shift key, but the manual does not tell you this.

There does not appear to be a way to type over text, the old text moves down and must be deleted later. There is supposed to be a way to move, copy, and delete blocks of text, but it does not work as described in the manual. Text can be copied to the end of the existing text, but when I tried to copy a line of text to a different location, it would only go to the end of the old text.

As you type, the text is fit around any photos that are already on the panel. If you do like the results you can move the photo and the text will reposition itself to fit the new panel layout. You must be careful doing this however, because if the text you had entered will not fit it is dumped into a buffer. If this happens, you can put the photo back where it was or try a different position.

You may find it necessary to retype some of the missing text because there does not appear to to be a way to retrieve the buffer. You should also be careful not to overfill the panel you are in because any overflow will be lost. You must save each panel before starting a new panel.

The next area is the layout area. This is where you reassemble the panels into their final position. This is a fairly simple task provided you remember the names and order of the panels you want to use. You can save the page for printing later, and you can save the page format for use next time also.

The last area is the Press room. The menu gives you a long list of printer configurations that you choose from and then you give the name of the page you want printed and PRESTO there it is.

In closing, I give the program's clip art disk a very high rating, but the drawing and text editor a low rating. The ease of use is not very good and the division of the program into different tasks is okay as a study into newspaper publishing but just makes using the program more difficult. The manual is good but not great. Overall Rating (Standard. 1-10 Scale) = 7

$54.95

Put aside your joystick and put on your thinking cap if you plan on tackling this complex compugame of galactic conquest. Set up for play on either a solo basis or between two live opponents, *Stellar Crusade* is a very impressive simulation of interstellar exploration, exploitation, and conquest in the Kiffryn's Cats star cluster. You can choose to play as the Corporate League or the People's Holy Republic, and from there the levels of complexity grow. You command colonies and fleets of starships, taking part in two war scenarios or short and long campaigns. You can choose from 5 levels of difficulty or let the computer randomly (and secretly) choose the difficulty level. In addition, reality levels have been added concerning the maintenance of your ships and training of troops, and the hidden movements (the fog of war) of enemy ships, which should be off for when you're just getting started. This one's tough enough to get a handle on at the start, that none of these controls make a difference at first, but they represent the kind of attention to detail that is the hallmark of first-rate simulations. Even though it's more science fiction than your average SSI wargame, there is enough military structure to make the jump from reality-based naval-battle simulations to interstellar battles rewarding. Previous experience in such simulations is recommended, but not necessary to get into the swing of *Stellar Crusade.*

Since I mainly play RPG and adventure games, the mechanics of this game drew no better parallel, other than with SSI's board-based simulations, in my experience than with *Balance of Power.* You basically gather data and make choices via a GEM bar menu setup with an interactive map of the star cluster, where flags mark the loyalty of each system. From the simple GEM menus, you will access a variety of screen menus that illustrate, as well as textually provide, information about fleets, ships, and planets in great depth. Choices are either keyed in or clicked upon by mouse. The same mental muscles are exercised by *SC* and *BOP,* but with divergent political intentions, rest assured.

As a simulation, this game has no concrete goal like getting the Firestaff or saving the universe; instead, rules of victory according to the scenarios and campaigns provided on *SC*'s data disk are your measures of success. *Stellar Crusade*'s design and purpose is to make you feel as if you were in command of a large-to-vast starfleet, an overseer of starsystems in conflict with another such overseer (played by the computer or a friend who is similarly endowed with delusions of granduer, or at least has avery literal Napoleon complex). In order to bring this macro-role the approximation of reality, the details of your command are many and varied. The short scenarios are provided for the beginner to get a taste for the movement and combat aspects of the game. Once you've mastered these games, which are going to provide months of playability in and of themselves, you move onto the campaigns, where extra levels of your command are played out in the exploration and development of planetary systems, as well as handling the aggressive tactics of your opponent.

I have to confess an inability to condense what the excellent docs take 35 pages of two-column text to describe into something that gives you a better idea of what this game is about. All the little details are what makes simulation games attractive to serious wargamers and scare the rest of us off. So for those who like listings of details, I'll oblige right after handling the mundane usuals that reviewers are required to describe.

The packaging of this game is properly representative of its type. From the actual screenshots on the back of the box, you see excellent graphics without being lead to believe this is *Star Raiders: The Empire Strikes Back*. My only grumble is that while the text description of the game is fair and accurate, the order of activities undertaken in the game are presented in reverse order as far as you can actually play the game. You learn to conquer first, then exploration and building are added on, when I would have liked to explore and build first. No scenario supports that activity without the element of conquest rearing its complex head. That's a bias on my part, but also a bug in my ear that whispers "This is not logical," thus tainting my sense of the simulation--but it's really a matter of chickens and eggs coming first. Otherwise, SSI knows its business when it comes to packaging.

A Word of Explanation

This review was originally prepared for ***ST Applications,*** which is no longer with us. I haven't talked to Bill Petry, the editor, but from conversations with him over the previous two years, and especially the last few months, it seems he just couldn't get more than about 6,000 readers to buy the magazine. And with that small a base, he couldn't get advertisers. I think it's a shame to have lost that magazine, which along with *Current Notes,* provided the most timely information and reviews on the ST scene. It also provided columns on programming, desktop publishing, MIDI, and a platform for the irascible Dick Biow, who previewed *pc ditto* and *Turbo ST* before anyone else knew they existed. It also carried a column on freeware/shareware written by yours truly and I feel bad that such a vital scene isn't being covered with encouragment for users to support these freelance programmers and to show the value of the shareware concept to the ST community. The last issues were among Bill's best--a testament to his constant goal of improving the content and coverage of his magazine. I think it's a shame we lost that editor.

Well, this section of *AIM* is Mine! And so the freeware/shareware columns (and some reviews) live until I've exhausted what I'd prepared. After that I'll have to see. I've paid for all the shareware I use, but I got paid only for the columns that were published. Frankly, I'm a freelancer and in the same position as a shareware programmer--the work's hard and the pay's cheap, and one has to weigh the costs and benefits. I'm still writing for a commercial magazine that goes by the name of *ST X-PRESS* and I sure hope you and your ST friends will support it (as well as *AIM,* of course!) by subscribing and telling software publishers you read it there/here first when you register your software. That will encourage me to write about my various encounters with the world of the Atari ST, and to keep this "interFACE" going.

Both the program and the data disk are not copy protected, but to run a scenario or saved game, you must refer to the manual for a word selected by the computer in order to continue. Thus, you can run the game from a hard disk or two drives without a key disk. You can also buy the game now that I've exposed its protection method and photocopy the docs and sell/trade it with your friends. Be a jerk all of your life, too.

The docs are complete and written jointly for the ST and the IBM PC XT/AT, whatever that is. No need to translate up from IBM here, it's for us, too. Maps, tables, and orders of battle necessary for scenarios that need them are included here. I would have liked to see some of the command screens represented, but since they all act like help screens anyway, better just to get the textual explanations over and boot the disks, right?

That covers the usuals. Now a little bit more about the game structure. The combat scenarios introduce you to the game's handling of your fleets, determining among transport, attack, or reserve missions; accessing the four levels of command for training, escort, raiding, and special support; choosing compostition and movement of fleets; and seeing the effects of long- and short-range combat.

During the movement phase, you can access the game's Quick System Display to track the condition ofa star system with pie charts and symbols without leaving the main map screen or you use the GEM bar menus to access the detailed screen menus to handle the aforementioned commands and also the usual file management tasks for starting, saving, loading. You also access the resolution phase, which will present information-oriented graphic depictions of fleets in battles you've initiated, whether off-planet or on the ground.

Again, this is a cursory description. You also handle transfers and reassignments of troops and vessels, determine what kinds of cargo (from colonists to mining equipment) and weaponry to place on ships, and send spies to disrupt the economy of your enemy. As you get into the tapestry of details involved with exploration and colonization, you'll be designing and building starships and working to win the loyalty of the planets under your rule and improving their productivity.

Thus, when you get to the campaigns, you deal with special system characteristics, which include the presence of gasworlders, Oort People, Aborigines, Spiders, and paleotechnology, among other things. Each characteristic affects how well a planet will fit into your crusade. As mentioned, you will read the systems' attributes charts and know whether cargo should include farm kits or factories, and whether belt colonies would work better than protected colonies. Once the details shift from counting stars conquered and ships vanquished, the rules of victory also shift to including production and economic points.

Returning to the levels of difficulty, realism can be enhanced through the Maintenance choice, and thereby having the computer check all ships for wear and tear, each ship having about a 10% chance of *failing*. Don't forget the fog of war, too. Hey, without the details it's not a simulation, right?

And this is a good one. *Stellar Crusade* has an excellent interface, which in addition to making the task of conquering the universe as simple as such a complex task can be, it also allows you to set the colors of its screen menus if so desired, although the four-color treatment of text is very appealing as well as functional in accenting and distinguishing types of information being presented.

There is nothing flashy onscreen here, but this isn't a graphics adventure. The graphics are quite appealing and serve their functions well. The flash is in the imagination and attention to details, and in the challenge and playability, measured by levels of difficulty and the flawless error-handling of the program.

VANITYWARE

A long time back, before Intersect and Randy Mears went commercial with their excellent terminal program, *Interlink ST*, they put out an nifty ramdisk accessory that allowed you to set the size of your ramdisk with sliders. It was a true Macintosh-type accessory and very attractive compared with the plethora of other such programs. I never used more recent versions of that accessory so I don't know how it was improved over the intervening years. But now Intersect has given us RAM Baby that is capable of handling larger amounts of RAM and allows setting up a print spooling partition to the RAM disk. Again, it is a very attractive (and noisy, if you leave the sound on) GEM screen device that lets you click on a button to designate the drive label (A-P), configure it to automatically install at bootup, and flush the print spooler.

That's really about all it does. It is not reset proof, nor does it have any autoload features that are available with less aesthetically configured ramdisks. I'm really not certain why they bothered with the plethora of ramdisk programs available as shareware or freeware. I like having the option of having a ramdisk as an accessory rather than an autobooted program, and de-installing RAM Baby appears to return most of your memeory to the system, which its earlier version did not. I tend to look at this area of software as no longer a viable commercial market, so it's more a matter of pride in seeing how many people download your product and see your name on it. And if that's the case, then the features I've mentioned should be added to RAM Baby if Randy Mears desires the full vanityware effect.

As it stands right now, the accessory takes up too much memory for the features its offers/lacks.*Donavan Vicha*

Street Fighter

Review by Bill Boles (MACE)

By now, many of you may be getting bored with my reviews about Martial Arts games (Karateka, World Championship Karate, etc, etc.). But I promise that this shall be my last such review (honest). The reason I wanted to write about Street Fighter, which is published by Capcom Co. LTD. for the ST computer, is that this is a game which is very similar to Epyx's World Championship Karate, but better than the afore mentioned title in some ways and not as good in others.

In the game, you play the role of Ryu... a high kicking, judo chopping karate expert whose task is to do battle with the toughest fighters of Japan, England, Thailand, China and the United States. The game begins after you select which country you wish to begin with.

Control of play is almost identical to Epyx's karate game, that is, half of the moves are controlled by moving the joystick and the other half by moving the stick and pressing the fire button. One difference in this game is the characters you will meet are much more varied and each requires a different approach in order to defeat them. These include characters who are good with their feet, are armed with Judo sticks, and even one who comes equipped with throwing stars and can vanish and reappear at will.

Probably the best fighter in the game is an English chap named Birdie. Don't let the name fool you...Birdie (a charming looking fellow with a Mr. T haircut) is almost twice your size and can put you away real fast. His favorite tactic is to whirl around and ram you with his head. Your strength, along with that of your opponent's, is represented by a red bar at the top of the screen. When this runs out, you lose, and if you get beaten twice by the same opponent the game ends.

And now, you would probably like to know how this game compares to World Championship Karate. First, as mentioned above, the controls are just about the same. Second, the scenario is the same — fighting all comers to gain points and earn the title of number one fighter. And lastly, there is a part between matches with each country in which your character must break a stack of bricks to earn extra points.

Street Fighter is somewhat better than the other game due to it's excellent graphics, the music which fits the mood perfectly and all of those different fighters to battle with. However, there are a few minor problems such as when you change the disk (this is a two-disk program), the drive starts spinning again before you can get the disk in. Another problem is that the characters move a bit slower than one would like, and finally, your high scores are not saved to disk.

Despite these few problems and the fact that this type of game has been done a thousand times (especially on that "C" computer) Street Fighter is one of the better ones, and I would recommend it to anybody who has never purchased a Martial Arts game.

Stereo Sound

Tired of turning your monitor speaker all the way up with unsatisfactory results? How about adding simulated stereo at the same time? You need our:

Stereo Synthesizer System *features:*

1) 1 control unit, 2 2-way speakers (2 lbs., 10 oz. each)
2) Frequency responce 20 Hz to 20,000 Hz
3) Select from mono or *two* separate synthesized stereo options
4) Locate the speakers as close to your monitor as desired. Speaker cabinet fully shields the magnets to prevent any monitor distortion and interference.
5) Built specifically for computer systems.
6) Speakers are a convenient compact size for close quarters. (7.25" H x 4.25" D x 4.5" W)

Price: $79.95

Required: *Any 8-bit system w/monitor port, or any ST system (with our 2nd Sounds Adapter).*

2nd Sounds Adapter
Female RCA jack ready for you to plug in any stereo or amplified speaker system.
Price: $21.95

Nickelodeon Five-*Plays AMS, SID, Music Studio EZ Track & Music C.Set files. Midi compatible, or play through your monitor speaker!* **$19.95**

Install an Alternate Operating System in an XE

by Don Neff (MACE, WAUG)

When I use my Atari XL I have three Operating Systems (Omnimon, Omniview and the original Atari OS) available by the flick of a switch. The installation of these alternate operating systems was an easy job in the XL. They reside on a small printed circuit (PC) board which is plugged into the socket of the original Atari OS.

When I bought my XE I wanted to install these same OS chips in it too but ran into problems. First the XE OS chip is soldered in place on the mother board. Second, it is located under the keyboard and does not have enough overhead room to permit the installation of a socket and the other OS chips on their PC board. My solution was to give up the Omniview and piggyback the Omnimon chip on the XE OS chip.

What is an Alternate OS?

Several people make replacement operating systems for all the Atari 8bit computers. My favorite alternate systems are Omniview and Omnimon by C. David Young.

Omniview is an 80 column system for the 8bit. Yes, you read that correctly — an XL/XE 80 column word processor (OmniWriter) has been available for several years. You can also use 80 column telecommunications with it and, if that's not enough, it utilizes your 256K or 320K memory enhancement. You can switch between 40 and 80 columns any time with just two keystrokes.

Omnimon is a powerful hacker's delight. It is a resident machine language editor/monitor, a disk sector editor, a Hexadecimal calculator, and much more. I will probably never discover all the things this OS can do. Omnimon will also run all the old Atari programs without the need for a translator disk.

Installing Omnimon in the XE

Open your XE and locate IC chip U5, the Atari OS. Gently unsolder pin #20 and lift it from its hole in the PC board. You must be very careful or you will destroy the thin copper traces in the area. An easier method of removal might be to cut the pin with small diagonal cutters or a sharp Xacto knife, near the surface of the PC board. Bend the pin up until it sticks out parallel to the PC board surface as shown in Figure 1. Solder one end of a 12 inch piece of wire (RS #278-1307) in the hole from which the pin was removed. Solder a second 12 inch piece of wire to pin #20 of IC U5.

Gently bend up pin #20 of your Omnimon chip so it sticks out away from the other pins just like pin #20 of U5. Place the Omnimon chip on top of U5 in piggyback fashion, as shown in Figure 1, and look carefully at all the pins. All the pins on the Omnimon chip must make good contact with their corresponding pin on U5, except pin #20. Remove the Omnimon chip and bend the pins as needed to insure good contact. When all 27 pins have good contact with the pins of U5, you can solder the matching pins together using as little solder as possible.

Solder one end of a third 12 inch wire to pin #20 of the Omnimon chip. Solder one lead of a 4.7K ohm resistor (RS #271-1330) to pin 28 of the two piggyback IC chips. Solder a fourth 12 inch wire to the remaining lead of the resistor. Cut three 1

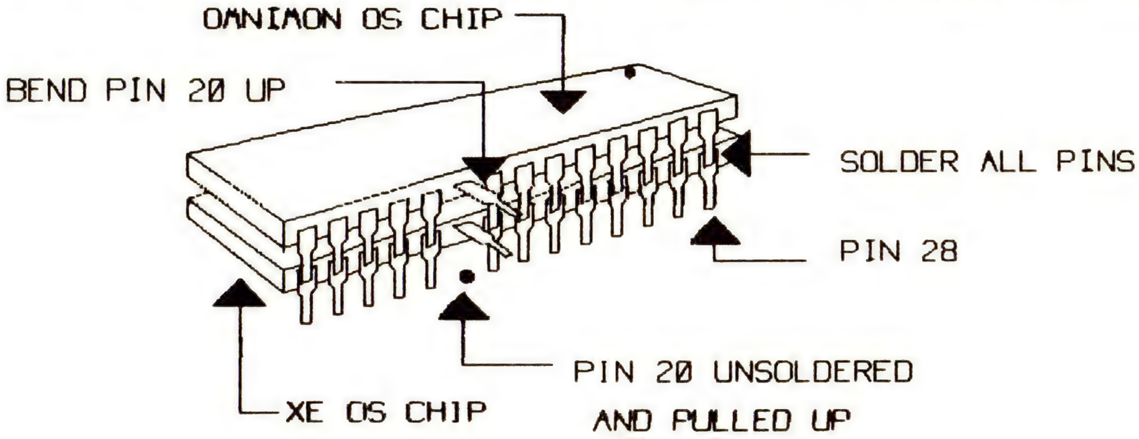

Figure One

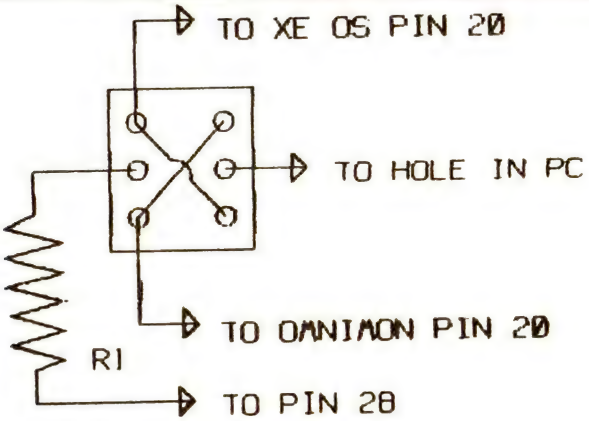

Figure Two

inch pieces of insulating tubing (RS #278-1627) and slip them over the appropriate wires to cover the resistor leads and the two IC pins. Use the heat of your soldering pencil to shrink the tubing so it won't move later. Just hold your tip near the tubing without making contact. If you touch it with the tip, the tubing will melt and you will have to replace it.

Connect the four wires to the switch (RS #275-614) as shown in Figure 2. The wire from the hole in the PC board goes to one of the center terminals on the switch. The wire from the resistor goes to the other center terminal. The wires from the IC chips (pin #20) go to the end terminals (both on the same side) of the switch. Use two short pieces of wire to connect the opposite end terminals of the switch as shown in Figure 2 (the jumpers are not connected to each other where they cross).

Drill a 1/4 inch hole in your XE case, mount the switch in it and reassemble your computer.

Testing the System

Boot up a DOS disk as you normally would. Hold down your Option and Select keys together, and then press Reset. Release the Reset key first and then release Option and Select keys. You should see a new screen display without going through a reset. If your computer just resets itself, flip the new switch to its other position and repeat the steps described above. The switch position which causes a normal reset should be labeled as the XE position. The other position should be labeled as the Omnimon position.

Where to buy an Alternate OS

Omnimon, Omniview are available from: CDY Consulting, 421 Hanbee, Richardson, TX, 75080

Boss is available from: Allen Macroware, PO Box 2205, Redondo Beach, CA, 90278

Write to both companies and request their free product flyers or refer to their ads in Antic or Analog.

SuperBase Professional Databasing on the ST

by SysOp*Dave Groves, CIS

It has finally arrived!

A full GEM implementation of relational database management in a form that is usable without prior programming knowledge or the need to learn a new language!

A GEM implementation that allows you to do virtually everything by mouse control, yet also gives you full keyboard control and a powerful data management programming language that is syntactically a look-a-like for most of the common BASIC programming languages!

A GEM implementation that allows you to define major macros under your Function Keys such that a single keypress will allow you to select and compare data from multiple data files and present the results on screen.

It is here and for the HD User who will get the most out of it, it is not (in spite of what the manual says) copy protected! We are talking version 2.03 software, thoroughly tested and bug-free, from a major British producer, with parallel production in use on both Amiga and MS-DOS machines.

For its maiden voyage on my system, I used it to catalog and index a 4200 record, 12 field, 700 bytes per record listing of CIS Atari Forum files, and it performed like a champ!

Nobody has yet proposed a good "benchmark" series for ST Data Base Management programs, so I am not able to present any meaningful comparisons for speed in use, though it is as fast or faster than any other system I have seen to date.

The beauty here is that in setting up "filters" (formulae to select which records to operate on in a group of records) the formulae can be input by mouse.

This makes printing reports and finding data by odd groupings super easy, and readily do-able without heavy-duty program writing. In two weeks of use, I have scarcely scratched the surface of the power of this package.

If you have a major database interest, SuperBase Professional is THE database management system of choice on the ST. It allows direct conversion of DB II through DB III+ MS-DOS *.DBF files into *.SBF (SuperBase) files, though dBMan and other ST db manager files will have to be converted to ascii delimited files and imported. (A very simple task in most cases).

If you are not a "numbers cruncher" like me, you will still find that SuperBase is worth its weight in platinum. It allows you to display "External" files. What's an External file? Oh, how about a *.IMG GDOS picture or a *.PC1 DEGAS Elite picture, associated with descriptive data and other information? Or some generic text files. This is power.

With its GDOS implementation supplemented with G+PLUS from CodeHead, you have as close to a desktop publishing operation as any database ought to get.

In addition, the Forms Editor of SuperBase allows you to build input screens that make the old Haba Checkwriter screens look wimpy (remember, you can play with fonts and type styles available under GDOS as well as with colors and patterns, and a host of lines, boxes, and areas).

Couple all the facilities together and you have a 4th or 5th generation database system of outstanding quality. It has mail merge functions forms printing capacity, and will out put metafiles.

Indeed, the ONLY weakness I have found in the entire system is the onboard text editor. The way everything else in the package works, I expected a full-fledged word processor!

Precision points out, very carefully, in the manuals that the test editor is precisely and only that. It is a decent text editor, 'ala an early EMACs, and performs the function adequately. I give SuperBase Top Rating for any relational database system on any computer today.

SuperBase is provided as a 4 disk set with 2 spiral bound manuals in a hard-shell stand-alone case. Manual 1 covers the basic database operations, the text editor and a tutorial. Manual 2 covers the forms editor and programming language.

The manuals are well edited and well indexed. They are clear, concise, yet comprehensive. The four disks include a Program disk, Forms editor disk, Data Disk (with helpful examples galore), and a GDOS System disk.

The Suggested Retail Price is $299.95.

ST/MEGA

Michtron Eprom Burner (up to 512K eproms) $199

Atari SH204 Host Adapter This is the cheapest Atari hard drive host adapter availlable. Can be used with standard hard drive controller cards like the Adaptec 4000A. Great for building low cost hard drive systems. $60

P.C. Ditto cable kit (3 ft cable with installed 14 connector one side and bare wires the other side and 34 edge connector + pin outs) $10 ea.

Because you asked for them we have brought in! 3 ft SC1224 and SM124 monitor extension cables! (M to F) For use with Goldstar and Samsung monitors with one sided short cables $25

13 pin Female cable connectors $4.75

14 Pin Female cable connectors $5.60
(Use these 14 pin Female connectors with a standard printer switch box and make a drive switch box for P.C. Ditto drives)

Mouse Feet (our feet have twice as much teflon material) $4 pk (4)

Mouse Eyes (Taiwan mouse only) 8pk (one mouse set) $5

Mouse Cleaning Kit by Tacklind $12.95

Mega Keyboard Covers $8.50 ea.

400/800/XL/XE

Digital Devices APE-LINK Kits (adds extra SIO Connectors to Your Atari Daisy Chain) Bare P.C. Board $10 Kit $21

1030 Modem Special ! 29.95

New 256K Atari Game Cartridges in stock. See our cataloge for listing!

Thomson Proburner Eprom Burner $149.00

XL Keyboard Mylars in stock now! $22 ea

In Stock 130XE Cartridge Connectors $6.30

Many people have asked which Mailing List program we use at Best Electronics, we currently use Super Mailer+ from Royal Software. Super Mailer program (D) $39.95

XL to XE Software Compatiablty Mod by Tom Lawless. This two chip/switch mod is for enhanced 800XL computers (256K-512K). $8

Hardware upgrade kits and P.C. boards that require the 41256K ram chips have been put on hold because of the high price of ram chips. We hope to ship again once ram chip prices start to drop down!

UltraSpeed Plus Operating System for the 8bit

by Jeff Kyle

Do you use an expanded 1050 or an XF551? Do you have more than 64K? Do you use a translator often? If so, or even if not, then you need the UltraSpeed+ OS package from Computer Software Services (CSS), sold for $69.95.

The US+ OS is a collection of three operating systems for your XL or XE machine. It contains the standard XL/XE OS, the UltraSpeed+ (US+) OS, and the XL-Fix+OS (XLF+).

The XLF+ OS is an OS that is as compatable as is possible with the 400/800 OS. This lets you use all the programs that would normally require a translator by just flipping to the XLF+ OS.

By the OS being ROM, it is also possible to use 400/800 cartridges that normal translators can't handle. Some commercial programs won't work with a ROM-resident translator, though. An example of this is the older Electronic Arts programs.

However, by booting up and holding down SHIFT, the OS will be copied to RAM as if it were a standard disk-based translator, allowing these programs to run also.

Also included in the XLF+ OS is a built-in Mach Ten Menu and writer. This is a program like the public domain Fenders that will load and run binary files from disk. When you boot up with SELECT held down, you'll enter it. It will let you load any of the first 22 files on a disk, get a directory from any drive, and write out a shorter form of Mach Ten menu to the disk. The shorter version will only let you load files from drive one. The OS also reverses the standard use of OPTION, in other words, to enable Basic, hold down OPTION, to disable Basic, don't hold down OPTION. It also speeds up the keyboard response.

The UltraSpeed+ OS is much more. However, all cassette routines, the 1200XL function key routines, RAM and ROM check at bootup, the international character set, and the relocating handler routines have been erased to make room for more features. You'll probably never need them, but if you do, just switch down to the standard OS.

If you have a high-speed drive, the US+ OS will automatically enable the high speed on 1050s with a Super Archiver, Happy Enhancement, US Doubler, Duplicator, Klone, and Density Doubler, or the unmodified XF551 drive. If you have one of those drives and are not using the high speed, this alone is worth the price of the OS.

Now you can use UltraSpeed with any unprotected disk you own, and use it in any DOS you use. This allows you to do things like take an Infocom adventure and copy it to a high-speed formatted disk and run it in high speed, speeding up the disk access by approximately 3X. Once you've used UltraSpeed for a while, you'll never go back.

The OS also gives you flexible command over the high speed. Pressing SELECT-OPTION will disable the high speed, and START-OPTION will reenable it. Also, holding SHIFT or SELECT when formatting will format the disk in standard slow skew instead of high speed skew.

If you've expanded your XL or XE to 256K or beyond, the US+ OS will automatically configure your RAM as a standard, configurable single or double density disk. The nice thing about this is being able to have a standard RAMdisk, compatable with anything.

It's easy to format it and write out DOS to it, so whenever you want DOS, you can boot from RAM. Also, it is set up to use the standard 130XE 128K RAM banks last. What this means is that, if you have 320K or more, you can have a full RAMdisk and run a program that uses 128K (such as Video Blitz, 130XE Koala Viewers, AtariWriter Plus, etc) without worrying about damaging anything in RAM.

As in the XLF+ OS, the US+ OS reverses the OPTION key, speeds up the keyboard response, and darkens the background color. However, now you may change some of these along with doing some of the things the 1200XL owners could do with their function keys with your US+OS, by using CONTROL-n or SHIFT-CONTROL-n. This is what you can do:

CONTROL-8 will lock or unlock your keyboard, in case you don't want people messing with it.

CONTROL-9 will toggle the internal Basic. This command only goes into effect upon RESET.

CONTROL-0 will restore the normal background colors and slow cursor.

SHIFT-CONTROL-0 will turn them back.

SHIFT-CONTROL-7 will toggle the disk I/O noise on and off.

SHIFT-CONTROL-8 will turn the screen DMA off, speeding up most processes by 30% or so. Any other key will reenable it, preferable SHIFT-CONTROL-A, which causes no character.

SHIFT-CONTROL-9 toggles the keyboard click.

There are other custom keyboard functions with the US+OS; one is the modification to press SHIFT-CONTROL-Clear instead of SHIFT or CONTROL-Clear to clear the screen. The only problem is that with Action!, SHIFT-CONTROL-Clear will normally bring you to the left side of the screen. This will no longer work in the OS. If you need it, just flip to the standard XL/XE OS, then switch back after you've used the key.

Also, you may now press CONTROL-4, 5, 6, 7 as well the CONTROL—, =, +, and * to move the cursor up, down, left, and right. Also, by pressing CONTROL-Caps, you not only can use the normal graphics characters, but also use the cursor keys without holding down CONTROL.

By either pressing HELP-RESET or pressing SHIFT-ESC then pressing RESET, you can force a cold start of the computer. This is useful when you've got important files in the RAMdisk and the computer won't let you RESET out from a program normally. One powerful feature of the OS is it's ability to reconfigure drives for different numbers and boot from any drive, including RAMdisk. When you hold down START after a RESET (warm or cold start), you'll enter a menu that has lists drive 1-9 and what each is assigned as.

Normally, they are all assigned to themselves, except drive 4 which is normally RAMdisk. Say you wanted drive 4 to be drive 1 and drive 1 to be drive 4. You'd press RESET and START. You then press C for configure, enter the original drive (1), then the drive you want it to be (4). Then you repeat the procedure for drive 4. It's that easy! With this menu, you can also change your RAMdisk number just with R for RAMdisk, then enter whatever drive you want it to be.

Also built into the menu is a small sector copier, mainly for drive-to-RAMdisk or RAMdisk-to-drive copying. It will read the density, format the destination in the density, and copy the disk a sector at a time. If you want, you can do normal drive-to-drive copies, but because of the one-at-a-time approach, it won't be as fast as a standard sector copier.

If you've entered the menu from a coldstart, you may also temporarily boot from any drive, just by pressing the drive number. This will swap the drives. By pressing SHIFT-CONTROL-6, you can "unswap" the drives and restore the drives to the original configuration. This won't reset everything, it just swaps back the drive you booted from. For instance, if you booted from drive 3, you could still use drive 1 if you referred to it as drive 3. Pressing SHIFT-CONTROL-6 will reset it so that drive 3 is drive 3 again and drive 1 is drive 1 again.

Occasionally in the standard OS, an OSS "supercartridge" can be ignored due to it's bank selecting. The US+ OS sends a command to "wake it up" to eliminate this problem. You can also easily install an external switch to swap the RAMdisk and drive 1. With this switch, you can make RAMdisk drive 1 at any time.

Unfortunately, if you use SpartaDOS, the reconfiguring will have no effect due to it's using custom routines, bypassing the OS. Also the Virtuoso player will always go to the "real" drive 1 instead of whatever is configured as drive 1. Also SpartaDOS will not boot from RAMdisk, allow the keyboard functions (without a KEY OFF command), or allow high speed with the XF551 drive. But if you MUST use this DOS, it is easily modifiable with a built-in patch called by a simple USR command that will modify SpartaDOS to allow these things.

The new OS has removed the standard Self-Test routines and put in a RAM check supporting up to two megabytes. This is also the FASTest RAM checker I've ever seen. Also, in the same vein, the US+ OS frees up pin 17 on the PIA for easier one-and two-meg upgrades. Doing so will disable the self test and the standard XL/XE OS, but it will work.

Before the OS, there was a problem if you turned your machine off and back on very quickly, because of the way the high-density RAM chips retain their memory for a few seconds after the loss of power. With the new OS, this problem has been eliminated.

The US+ OS also supports a seperately sold RAMdisk write protect switch which will protect either your RAMdisk memory or all of the extended memory from writes. The documentation that comes with the OS is satisfactory. It explains all the functions in detail with many examples. It explains the functions and the installation completely. It would be nice if it told more of the technical information, but it is better than most information that comes with other custom OSs.

Installation? I can't really say about the difficulty as I had mine installed by the author. But looking through the instructions, mainly it should be easy on the 800XL. On the XEs, most of the time the OS is not socketed in, but soldered in. If it is soldered in, you must desolder the OS, which requires a bit of soldering skill. Other than that, it is mainly soldering a few wires to some of the chips, plus drilling a 1/4" hole for the 3-position switch to switch between the OSs.

And that's the OS! I have found very few compatability problems, but when they do arise, it's as easy as switching back to the regular XL/XE OS. Having all the special functions available is handy, as well as being able to boot from RAM.

However, there have been problems when switching from the standard XL/XE OS to the XL Fix+ OS. Because of different locations, switching can occasionally make a program point to something that can screw up your RAMdisk. This is rare, but it is a good idea to back up your RAMdisk before just jumping into the XLF+ OS.

Other than that, I've had very few problems with the OS. It works as stated, and the keyboard functions work with most programs. At $69.95, it's a great buy. So if you'd like high speed with your drive, better RAMdisk control, or just plain more power over your computer, don't wait. Buy this OS!

The Sport of Sorts

by Clinton Pierce (GAG)

In this installment, we're going to look at one of the most fundamental problems in computers, sorting.

Human beings, as a rule, have an amazing sense of geometric perception. They will sort index cards with names on them by placing the names in relative order on the table (A is a lot farther away from P, than M is), and doing fine adjustments as they go along. Computers aren't human. They must sort using absolutes. You must tell them what is to be sorted (records), how it is to be sorted (keys), and where it is to go to (output). And they can only compare (again, as a rule) two things at a time.

The first sort is the standard Hey-I-learned-that-in-BASIC sort: the bubble sort. The bubble sort compares two elements in an array, and if in the wrong order, switches them around. It is finished when either n^2 repetitions have occurred, or when no more switches are made in an entire pass.

The next sort is Shell's sort. A Pseudo-BASIC program follows for an array a, N elements long:

```
1.M=N
2.M= Intger part of M/2, If m=0 then the sort is done else: J=1, K=N-M
3. I=J
4. L=I+M, If a(i)<a(l) then goto step 6, else: T=a(i), a(i)=a(l), a(l)=T, I=I-M, if I<1 Then goto step 6
5. Goto Step 4
6. J=J+1, if J<=K then goto step 3
7. Go To step #1.
```

This sort is fairly fast, and is fairly uncomplex. However, it has its problems. Two identical elements will be switched (always). Because of that, if the list has many similar elements, find another sort. (About line #2, a one element array, by definition, is sorted).

Next, we have the Selection sort (which, as we will see in the future lends itself to recursion). Take the same array A with N elements, and set a pointer Q equal to the number of elements. Algorithm: If q=1 then the array is sorted, else : Find the largest element in the subset (1..Q-1) and switch it with the Qth element, decrease Q by one, go back and repeat it again. This sort is fast, but does not deal well with an already sorted list.

The Insertion sort can be done one of two ways, with one array, or two. For simplicity, I'll present the two-array version. Clear the second array Z, and set the pointers Q & X to 0. #1 Move the first element of A into Z, and increase the pointers. #2 Take the Xth element in A, Find out where it goes in Z, and move everything in Z > a(x) down one element, make z(q)=a(x), Increase X and Q. #3 Go to step 2 until q=N. This sort is moderately fast.

Next, Quicksort, is the fastest sort I've dealt with. A complete algorithm will not be given until the unit on Recursion. But here's how it works: Given an array 1..N, arrange the array so that all values < a pivot value, are first, and > pivot are last. Then, the pivot is in its proper place. It is then done again, and again, using each smaller region until the array is sorted. The sort is incredibly fast. The number of passes needed is only N times the Base-2 log of N. (Where bubblesort would use 4096 repetitions, quicksort uses 384).

Until next time....Hasta Luego.

ProCopy **ST BACKUP UTILITY**

You can't backup your software because copy protection locks you out. **ProCopy** is the key!

- Protects against the accidental loss of expensive software
- Works with all Atari STs
- Copies both S/S & D/S disks
- Use with 1 or 2 disk drives
- Not copy protected
- **FREE** shipping and handling
- **TOLL-FREE** telephone number
- Updates are only $12 with return
- Orders shipped same day
- Disk analyze function included

NeoDesk 2.0 Now Available
The ST Desktop Alternative Made Even Better!

by Bill Rayl

It's here! With more features than you will know what to do with, NeoDesk version 2.0 is everything an ST owner could ask for! In fact, the new features in this alternative to the ST desktop should leave even the most stalwart critics of version 1.0 grinning from ear to ear.

The improvements made to NeoDesk, which was originally reviewed in the June '88 issue of Michigan Atari Magazine, were taken directly from the "wish lists" of registered owners of the product.

The biggest drawback to the original version was that it took up about 145K of precious memory at all times, making execution of memory-intensive programs nearly impossible on less than a 1040ST.

Gribnif has solved this problem via a "master program" or shell that runs NeoDesk. The shell allows the user to optionally configure NeoDesk to get out of the way before loading a program and then automatically reload after execution of the program. By using this option, as little as 24K of your system's memory is used by NeoDesk while you are executing that database or desktop publishing program! On a hard drive system, NeoDesk is back up and running in less time than it took you to read this sentence!

For those unfortunate ST souls who don't own hard drives, the "master program" has features just for you. If the shell cannot find the NeoDesk program (i.e, you've removed the disk from the drive when you booted another program), you will be prompted to insert your NeoDesk disk. There's even an option for specifying an alternate path for the NeoDesk files, designed for those who wish to keep the files in a RAMdisk.

Probably the second-most-heard complaint about version 1.0 was the lack of a "Show as Text" feature for directory windows. That feature has been added in the new version. And, as should probably be expected, programmer Dan Wilga gave more than anyone asked for! There are actually a number of ways to "Show as Text" in NeoDesk: one column or multiple column output, small or large text, and any combination of file size, creation date and time to be listed after the name. Using the small text size and multiple column output, the user can get up to 132 files displayed at one time in a window!

A number of other limits that had applied to version 1.0 of NeoDesk have been expanded or removed completely. The limit of 112 files per directory level has been removed by allowing the user to select whatever upper limit he/she chooses. Up to 32 icons, including up to 16 program or data icons, can be placed onto the desktop at one time instead of the old limits of 18 and 10, respectively.

As for the custom directory window routines in NeoDesk 2.0, they just have to be seen to be appreciated. The text that appears in the information bar (such as number of files and size of files in bytes) can be scrolled from left to right, allowing the user to read all the information without resizing the window. There is also a new button allowing a window to be sent to the bottom of a stack of windows. Windows that are buried in a stack can be resized or selected without making them the topmost window. And, finally, each directory window displays the disk volume name at the bottom of the window (finally, a practical use for disk volume names!).

Speaking of disk volume names, NeoDesk 2.0 allows for up to 20 characters to be used and the names can be created, modified or deleted with ease.

Another nice feature that has been added to the program is the ability to load a D.E.G.A.S. or NeoChrome picture to be used as the desktop background. This is a perfect way to spruce up your desktop.

In addition to the ability to auto-execute batch files, NeoDesk now can run any program, including .TTP files, at bootup.

Another very handy feature is the ability to MOVE files/folders as well as copy them by simply selecting the file and dragging it to its new location. Either COPY or MOVE can be user-selected to be the default mode, or the "Ask" feature tells NeoDesk to prompt for the type of operation to be used.

There is no longer a problem with programs that do not restore the mouse pointer when exiting, such as ST Writer and Publishing Partner. No more "mouse-droppings!"

There are many more enhancements to this excellent product, far too many to mention. A few of the additional programs that come with NeoDesk 2.0 do deserve mention, though.

First, the Icon Editor has a couple minor changes. The user can create a pattern for the desktop background to be used if no picture background is selected. Also, upon Quitting from the editor, the user is asked if he/she wishes to Save the icons *only* if the icons were actually changed and not saved. The previous version of the editor *always* asked, even when no Save was necessary.

The printer queue program has also been improved, allowing the user to set the type of printer, an option to output to the RS-232 serial port (including screen dumps!) and the ability to ouput a form feed after printing each file.

Finally, Gribnif has included a control panel that takes up less memory than Atari's control panel while giving at least twice the functionality! The control panel contains:

A corner clock supporting all existing third-party clock chips and the clock built into the Megas. The corner clock can be set to display AM/PM or military (24-hour) time. A screen saver can be set for one to nine minutes of no mouse or keyboard activity. A blitter chip control feature, mostly for Mega owners. The standard color palette, key repeat and keyclick, mouse speed and bell ON/OFF control options found in the Atari control panel.

The entire package comes in a bound, 100-page, illustrated manual that you will find indespensible until you get acquainted will the many features this package has to offer.

The suggested retail price for NeoDesk 2.0 is $49.95, but owners of version 1.0 can upgrade for *only* $14.95! Simply send in your check or money order (as well as your original installed NeoDesk floppy for version 1.0 owners) for the appropriate amount. Add $3 for shipping and handling. Owners of version 1.0 that did not send in their registration cards should fill out the card and include it with their order of NeoDesk 2.0. For more information, contact: Gribnif Software P.O Box 350 Hadley, MA 01035 (413) 584-7887.

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM

(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

Digisound ST

• • • • • • • • • • • •

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

• • • • • • • • • • • •

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

Power Print ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only $39.95

Polydisk

Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**

(Clock option card is also available for Polydisk $29.95)

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Bob Kingsbury	789-7533
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	
Editor	Jim Boyce	522-4074

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Michigan Atari Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

Fishin' Around

Well, I have to admit that I'm feeling pretty good about this last month's meeting. We had the biggest turn out that we've had for several months. And we all had a blast playing MIDI maze on the three STs that where there at the meeting. Hopefully, next month we can have another MIDI maze challenge.

Ok, a little good news, it looks like Musicians Warehouse will be opening it's doors again soon, and it s also said that they still intend to carry Atari software and some hardware.

I realize that the board was supposed to be up when you received your newsletter last month, but unfortunate circumstances prevented that from happening. Harold has been working on the BBS program so the board should be up by next week (my typing time) or by the time you read this. The hardware is all set up, all that needs to be done i to have the software installed. So at this point I can give you the number and the location. The board will temporarily be at Craig's house and the number is 787-4011.

One thing that I forgot to mention at the meeting was about the modem so if you have any input please let us know. Silence will be interpreted as consent.

Those of you with STs good news, those with 8-bits bad news. It looks to me that Atari Explorer is now a ST only or at least 98% ST. Recently I received an offer to update my subscription. I'm positive that will not happen. If Atari Explorer does again put in more 8bit material I might change my mind. But I just can't see getting a magazine that is all ST when I don't own one.

MAM or Michigan Atari Magazine is changing their name to AIM or Atari Information Magazine. Pattie Rayl has assured me that this in no way means a change in format or in price.

I am afraid that this will be a very short newsletter this month, but hopefully next month our regular columnists will back for next month. Before I forget our next meeting will be Sunday, January 8th at 1 pm till about 4 pm. See you all at the meeting.

CAPITOL HILL ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Michigan Atari Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. The meetings take place at the MSU Physics-Astronomy Building, Physics Road, Room 118. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them. To get to a meeting, take East Grand River to the Collingwood Entrance for MSU. The first available left turn is Physics Rd. The Physics-Astronomy Building is about 1 block from the corner, on the right hand side. Park in the gated lot just past the building.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

President's Notes by Leo Sell

Time for congratulations (I think). As some of you know, I have now joined the ranks of ST owners. I know, I've been a long time holdout, but Maggie Mae (the wife who puts up with these things) conferred her blessing on the idea of getting an ST just when the unbelievable deal came along. I don't have any experience with it as I write this since I just picked it up and we might reserve it for Christmas. So, I'll take all the advice and suggestions you have for me. I'll need to know what PD programs to use, what games and utilities to buy, how to best utilize the capabilities of this splendid 1040ST. Feel free to pass on your advice!!

On other fronts, The Colossal Computer Sale we sponsored was a qualified success. For the most part the vendors seemed happy, the attendees seemed VERY happy - most carrying at least some bargain back out with them - and the club made a little money. Thanks everyone for your support and help.

Congratulations to the Rayls and Unicorn Publications on their new venture, Atari Interface Magazine (AIM). Ceasing the publication of MAM, and starting their own, wholly owned publication should serve to clear the ownership, policy, and authority questions that have dogged MAM since the Rayls took over as publisher. Properly handled, the new venture should completely eliminate those problems. As a commercial, for profit enterprise, with user groups as one group of customers, the relationship should be much more straightforward.

Just over a year ago, CHAOS transferred PUBLISHING duties for Michigan Atari Magazine to Bill and Patti Rayl. Until that time, MAM was owned by the participating clubs and published by CHAOS. John Nagy acted on behalf of CHAOS as publisher and manager of MAM, and as the representative of CHAOS to the newsletter.

Only the production and management was transferred ("publishing"), - ownership never changed. CHAOS and the other participating clubs never transferred their ownership to the Rayls nor to Unicorn Publications, nor were they ever asked to do so. However (and this is the key to all the troubles and dispute), the Rayls began to CLAIM ownership, and further, defined it in a way that has never been discussed with the clubs. With their new, commercial venture, they are able to rightfully claim ownership and I'm glad to see the question come to an end.

With the continuing "ownership" problem CHAOS experienced various disputes and discourtesies which are not so bad when taken individually. But taken collectively they revealed a mindset that made us increasingly reluctant to deal with the Rayls. I hope summarizing them here will help you readers understand better our side of the dispute even as the situation is resolving. Please consider them collectively, as a pattern of behavior rather than separately.

The earliest problem that comes to mind is our request to include "FORWARDING AND ADDRESS CORRECTION REQUESTED" in the mailing area of the newsletter. We requested the statement so that we could be certain that our members who move would receive their newsletter and that we would receive their change of address. Without the statement, a bulk mailed item is thrown away by the Post Office and we are not aware that a member didn't receive their newsletter until the member contacts us. When that happens the 80 cents or more the club paid for the newsletter(s) has been wasted, and often re-expended in order to replace the member's missing newsletter. In other words, not placing the statement on the newsletter can cost the club $1.60, $3.20, or more for every wrong address. If a forwarding request is on the newsletter, the additional cost on mis-addressed mail is a one-time 30 cents. Even though we offered to reimburse them for the notices, the Rayls would not place it, citing the additional cost. That has never seemed reasonable since previous experience showed only 4 to 6 such notices altogether in a typical mailing run. Frankly, we're concerned that now dozens of newsletters are lost every month, one after another to a dead address.

Another problem arose last August after a member made a trip to California. During that trip, our member was shown a copy of a letter soliciting subscriptions to MAM. It's not that the solicitation was a problem, but rather that we were not given any information about it. As owners, we should have been kept fully informed by the publisher. And it would be simple courtesy to send a copy of such communications to participants, regardless of any ownership.

As mentioned last month, in the summer I was called and TOLD that the price to the club per issue of the magazine would be raised to 95 cents. I was rudely turned down when I asked for proof of need (information CHAOS had a right to as an owner). Yet, within a month, the information appeared in a letter from the Rayls printed in ZMAG (the online Atari magazine). Incredibly, when I asked why it was ZMAG's business and not ours, their defense was that while they had presented it to ZMAG as true, the information they had provided was incomplete and really meant nothing. Then they deferred further questions about finances, stating that as a private business, they had no obligation to disclose their costs or profits.

The October meeting itself was the first of its kind despite promises for regular meetings and contact right from the beginning. Even this meeting was called by the Rayls only when it became obvious that CHAOS would call one to try and resolve the policy dispute and ownership questions if they didn't. Until that meeting the only contact we had from the Rayls was in the form of phone calls, usually announcing price increases.

At the meeting, the Rayls issued their own ultimatum, stating that they owned MAM and that they would not publish MAM unless their TOTAL control and authority was recognized by the participating clubs. We debated the name/ownership question, and almost nothing else, for more than two hours. That five hours (inlcuding an average 3 hours travel time) turned out to be wasted when we found out a week later that the Rayls had already committed to changing the name of the magazine when talking to out-of-state groups.

At one point during the meeting, it was generally agreed (even by the Rayls) that the use of the name MICHIGAN ATARI MAGAZINE is key to any dispute of ownership. It was even suggested by Bill Rayl that one option for them would be to withdraw from publishing Michigan Atari Magazine, which they have now done, and publish a new publication, making fresh agreements with any club wishing to participate. It's a shame that since they had previously committed to such a change, they let us waste all that time debating the issue when they could have told us that the question was moot.

In another attempt to resolve the issue, John Nagy (not knowing of the out-of-state contact) suggested that the ownership issue could be put to rest if all the clubs signed away their ownership rights, perhaps in return for a formal advisory board. When I asked about authority or veto power of such a board, the Rayls flatly stated that anything but advisory capacity was unacceptable. I DID NOT expand my question any further. The words of the quote attributed to me, demanding "full veto power...including but not limited to who participates in MAM, where the magazine is sold and printed and the overall style and content of the publication", belong to the editorial writer and NOT to me.

I was also misquoted regarding "support" for the proposal. I expressed my reservations, but stated that I would not oppose it if the majority of the groups supported it. Not opposing it does not mean I committed to voting FOR it and not opposing the proposal is far from "supporting such a proposal if the other clubs were willing to do so". I only finally rejected the proposal, after finding out about the contact with the out-of-state club and discovering that the entire ownership debate had been a waste.

Then there is last month's editorial, berating me personally and CHAOS by extension. I've already mentioned several misquotes that created a false impression about me and my positions. Another direct misquote appears after the question of if I had discussed the CHAOS position with the membership at large. I did NOT SAY, as quoted in the editorial, "we don't do things that way". What I told Patti was that our participation in MAM is a Board decision. I did however, bring the situation to the attention of the membership, as we had done most of the summer, and then took a vote on our position. As written in the editorial, the membership overwhelmingly supported the positions I have taken.

My position regarding ownership has stayed consistent. I have insisted on protecting property rights the clubs have never given up. I do NOT claim that the clubs USED to own the MAM, but that the clubs' ownership continues and will continue unless expressly given up. The editorial writer's note that most representatives at the meeting did not know of their joint ownership was a deceptive observation, and even if true, would not have revoked the clubs' true ownership. It is true that some of the clubs represented at the meeting were not participants when the publishing duties were transferred, and apparently were not informed by the Rayls that their clubs were part of the actual owners. Also, some of the older participant's representatives are new since the transfer and were not aware of their club's owner status.

As for the editorial addendum where I "threatened legal action". When I contacted the Rayls I was initially conciliatory, letting them know my opinion - since they had already committed to publishing under a name other than Michigan Atari Magazine, they should do so and thereby render the ownership question a dead issue. By publishing a different magazine, as they now choose to do, they could negotiate completely the terms of participation with all of the parties with no questions of previous ownership. It was after they rejected my constructive advice that I told them we were prepared (approved by vote of our membership) to take legal action if necessary to defend our ownership rights. I would not have made such a statement unless I believed we could win - either alone or joined by other groups.

Even in the publication of the proposal itself, there was yet another disagreement regarding whether and when the proposal to transfer ownership would be printed in MAM. Commitee members I spoke with were very clear in their understanding that the proposal would be printed in the December issue. Since my column dealt so much with the proposal, I called to confirm that it would be printed. I was flabbergasted when the Rayls denied any commitment to print it, at least not until it was passed. I advised them that it would be in their best interest to follow through on the understanding that several of us had and print the proposal. They did so, but without any of the explanatory notes that John had included with it in the original. By leaving out the discussion summary, they made it appear as if the proposal was coming completely out of left field with no rhyme or reason for it at all.

The proposal was an attempt to draw this dispute to a close and bring all parties to agreement, even if some of us felt it was less than satisfactory. Fortunately, with the new publication, it is no longer needed.

To wrap this up, let me make it clear that my motivation in this controversy has been solely to defend CHAOS's ownership rights - NOT to put CHAOS back into the newsletter business. It would have been easier to stay quiet and let someone else do the work, but sometimes principles are more important than expediency.

Now, with the advent of AIM, we will evaluate our options and see which will best serve our needs, including participating in AIM, the terms of which are not yet finalized, participating in Energy, which would limit by far the amount of Atari information our members would receive, or publishing our own newsletter - alone, or in cooperation with other Atari user groups. We'll discuss the options at the January meetings. I hope you'll be there and express your preference and willingness to pitch in and help with whatever alternative we choose. With your help, whatever we do, we hope to do better than ever.

GENESEE ATARI GROUP

Serving the Flint area

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Corp.

GAG meets on the second Wednesday of the month at the Neithercutt school, located at 2818 Crestbrook Drive, Flint. Meetings begin at 6:30 PM. Membership is $15 for one year. For information contact: Jerry Cross 736-4544 FACTS BBS 736-3920 or write: Genesee Atari Group PO Box E Flint, MI 48507

President's Report By Jerry Cross

As many of you know, there was a proposal in the November issue of MAM to pass control of the newsletter over to Unicorn Publications. I hope you all had a chance to read both the editorial and the CHAOS section also. By a unamimous vote of those who attend the meeting, this proposal was rejected. There were several reasons for this, most of which can be traced directly to much confusion about many points in the proposal and the general feeling that this is pretty much a power struggle over control of the magazine. From our club's point of view, it doesn't matter who controls MAM, but that whoever it is, must be responsive to each of the clubs needs and accountable for what goes into each issue. It was felt that the overall management of publishing the magazine should be given to one person (or group), but to give away all rights and input would not be in our best interest. The proposed "advisory committee" was not acceptable because none of the committee's recommendations would, or could, be implimented. Therefore, we can not accept the proposal in it's present state. I have requested that another meeting be held to try and iron out some of the problems that have developed.

This does not mean that our members will no longer receive MAM. I still think it is an excellent publication, and will continue to use it as a source to keep you informed about what is happening in GAG. If and when another alternative newsletter becomes available, I will decide what path we will take. It is sad that we must do this, since our club was one of the very first to join MAM. It has come a long way, and with luck will continue to do even better.

On to other stuff. Due to the increased cost in disks, we are forced to increase the price to $3 (up from $2.50), and 10 for $25. We hope this will only be temporary and will only last a few months. Also, for those who attend next month's meeting, Gil will be giving away one free disk with each purchase (limit one free disk only). If you haven't attended a meeting in a while, now is a good chance to stop by.

GKAUG ATARI GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets the second Saturday of each month at 11 am in the Dewing Hall, room 305, on the Kalamazoo College Campus, Corner of Academy & Monroe. Dues are $25/yr.

President:	Frank Fellheimer	657-6106
Vice President:	Dan Youngs	
Treasurer:	Dave Bryant	
Librarian	Dale Vincent	
Archiver:	Dave Oldenburg	
SysOp	Alex Stevens	
GKAUG BBS:		(616) 657-2665

Unfortunately, I was not able to attend the December meeting since I had to work. It seems the boss is supposed to show up on Saturday over-time for some reason. Really seems silly to me. However, the Vice President and the Secretary took care of business for me and Bryant left the following information for me:

We just got our first good winter snow and I thought it would hinder the attendence at this meeting (Boy, was I wrong). You can't keep the devoted users down. We had 14 people attend, out of the 28 registered members we have. We postponed the Officers Election till the January 14 meeting, so please attend! One position will be vacated, Dave Bryant is leaving the treasurer's post, so we need another member to volunteer. The treasurer's duties are mainly keeping track of the funds, maintaining the members records, and mailing the labels for the MAM newsletter.

General discussion about the change of the local CompuServe phone number and what was the latest version of the ARC program followed. If anyone knows the answer to either of these, please contact one of the officers.

We demonstrated the new programs that are on the clubs BBS (we finally figured out the problem we were having with the download area, so things should be working by the time you read this.) We hope to have a online game soon.

Also a modification for the XF551 disk drive was shown. It allows you to format and write to the backside of a disk (like the 1050 drive) without having to notch a write protect hole on the disk. It also solves the problem with the index hole, which the XF551 looks for when it does a format or write.

Well thats all for now. Have a Happy Holiday, and see you at the next meeting (January 14).

** David Bryant**

Next meeting is scheduled for 14 Jan 89. I have the new "Converter" program to demo. Lets you convert Printshop Icons to ClipArt and Awardware. Makes many more icons available for my ClipArt collection.

Also, we had to bypass the elections this month since I wasn't there to count the votes. We will try again next month. We are looking for a new Treasurer to handle the checkbook and mail labels for the AIM magazine. We got "Perks" for you.

Frank Fellheimer

Great Lakes 'GLASS', Michigans only
Atari 'ST' only Users Group
ST
Support I ♥ my ST!

From The Desk Of The President... December 12, 1988

So much to do and talk about and so little time! But first, let me start out by wishing all of you a very merry Christmas and happy and prosperous New Year!

By now the December meeting is over and the nominations for the officer positions have been made. The actual elections will take place at the February meeting with the elected officers taking their seats at the February PLANNING meeting.

The 1988 year went fast and furious and 1989 promises more of the same. Even the Atari Corp. seems ready to promote and support the ST and Mega line in and for the USA. Writing about all of the things that have happened in the ST world would take volumes, as can be shown just by the list of successful publications. So, what is the "theme" for this article? Well, I'm not going to write about all of the news and rumors, there are others that can do that much better. Nor am I going to mention the software, which includes some excellent titles, both new and old. The hardware available (did you see the fax-modem at the meeting?) is overwhelming and better represented by the experts. No, I want to talk about YOU, the user and your user group. (This article is directed also at non-GLASS members and other Atari User Groups and their ST members.) <....now he gets up on his soap-box....>

I. Software Piracy..please, please, please, examine your own conscience and consider the damage you are doing to yourself and other users when you buy, accept, trade, give and download pirated software...it hurts all of us!

II. Shareware..it really does pay to support the good shareware programmer, if you use it after a reasonable trial period send a donation to the author, it's worth it!

III. Non-user group ST'ers..not only can you learn a lot about your machine and how to better use it but you also stay in touch with people, and there are a lot of friends to be made out there. User groups can be informative and FUN!

IV. User group members...support and contribute to your group. You have as much to give as you get, just by your presence. Submit an article about your experiences. Write a review of your favorite software, even if it's been done before. Some others are also new at this and haven't had a chance to see old reviews and your experiences and opinions mean something to them. Try being an officer of your group for a year, we need the new ideas you will bring, and we don't ask that you be experienced. We offer "on the job" training.

V. User group officers..I realize that 99% of all of your clubs started out as 8bit clubs but you have to realize that the 16bit machine is a different computer. I've watched many of you languish because you didn't quite know what to do to this new sister. Bring her into the family and support her. The 8bit machines will always be with us and rightly so, the support should never end. But you are cheating both systems if you think you can cover them in the time you used for only one. If you are going to be a two machine club, you can't do justice to either unless you provide enough time to both, meaning you should consider meeting twice as often, twice as long, or have separate clubs under one officership. Don't die out because you can't adapt, we need you! <he climbs back down from the soap-box...>

Well, misty-eyed, I bid fond adieu to 1988 and look forward with excitement to what 1989 might bring...Atari Shows?...New hardware and software?...Better knowledge of the use of my machine? Peace On Earth, Good Will Toward Men?

Steve Mileski <GLASS>

GRASS
GRAND
RAPIDS
ATARI
SYSTEMS
SUPPORTERS

Meeting: Wednesday, February 1, 1988, Wyoming Public Library, 3350 Michael S.W., Time: 6:30 P.M.

George Nosky President/Treasurer (616)942-1527
2440 Parkridge Dr. S.E. Grand Rapids, Mi. 49506
Gary Heitz Vice President (616)676-0112
Marvin Waid Secretary (616)866-1998
Chuck Baughman Librarian (616)795-7373
Tim Feenstra Membership Chair (616)784-6230

I hope everyone had a very merry Christmas, and I wish all a happy, healthy and prosperous 1989. By the time you read this, you will have elected your officers for the new year. Results of the elections and your newly appointed directors will be printed in the February issue of MAM. This is my last "newsletter", so I want to take this opportunity to thank each one of you for the help and support you have given me and your other officers and directors this past year. Without yor help we would not have been able to accomplish any of the successes?? we may have had. I can't recall of a single instance when someone was asked to do something that there was any hesitation. Matter of fact, whatever the request, you gave it 110%. I just said "when asked". This is not entirely correct -- many people volunteered. THANK YOU VERY MUCH. You made it a fun year.

GRASS welcomes Terry Reine. Terry lives in Grand Rapids.

Gary Heitz and Tim Feenstra are continuing their Basic Seminar. I've heard many favorable comments on their presentations. Don't forget, we want to get these classes started at 6:30 P.M. on our normal meeting night. If you missed our December meeting, you missed Gary Heitz's outstanding demo of GEine. Since we don't have a telephone line available in our meeting room, Gary used his VCR to tape almost an hour's program for us. He walked us through the various menus and services GEine provides. He then gave us an indepth demo on how to use GEine. This was one of these 110% efforts I talked about earlier.

It's getting close to dues time again. Your dues run out at the end of February and your MAM subscription runs out after the February issue. We will discuss this at the January and February meetings.

See you at the next meeting.

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

Future Meeting Dates:

January 17
February 21
March 21
April 18
May 16 (MACE Birthday Party)
June 20

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)

Molin's Den	(313)420-0407	(3/1200)

Christmas Meeting Minutes

The December Christmas Party meeting was called to order at 7:45pm by Meeting Coordinator Bob Retelle, who recognized the following companies for donating door prizes:

Software Trends (Renegade, COLR Object Editor), Accolade (HardBall), Alpha Systems (MagniPrint II, Basic Turbocharger, Your Atari Comes Alive, Schematic Designer, Scanalyzer & Cheat), ICD (T-shirts), Intracorp (Murder on the Atlantic), Total Control Systems (GOE Cartridge), Rite Way (30 8bit disks, 2 cases & a Wico Boss Joystick), Rentertainment (First Word, Trivia Challenge, 10 ST & 10 8bit disks, and 1 case), Sector One (Haba Wills, House Estimator, H&D ToolBox, APX Software, 2 cases and 2 mugs), Word Perfect Corp. (WordPerfect v.4.1), Soft House (Better Dead than Alien, Haba Writer and Micro League Wrestling), Regent Software (Regent Word II), Merrill Ward (Celebrity Cookbook), Michtron (Slaygon, PinBall Factory, GFA Basic & Object, Major Motion, Jupiter Probe and GoldRunner) and Unicorn Publications.

Member Mike Lechkun discussed an article he had read in a newspaper stating that Atari is suing Nintendo. Mike noted the suit is the action of Atari Games, NOT our beloved Atari Computers.

Member Brian Wilmuth gave an impromptu demonstration of his BBS, showing off his MIO and hard drive.

Gordon Mella, of Word Perfect Corporation, led a discussion of the Word Perfect ST system and fielded questions from the members regarding current and future support. W.P. Corp has placed all future support plans "on hold" however "Word Perfect Corp will address whatever product is popular within the industry." *(Sounds like the same "hint" that Atari users have been expounding for many moons now... Hopefully someone at Atari is listening.)* Gordon also announced that the User Group Promotional Discount price of $155 was good only until 12/31. Gordon's "bag of tricks" contained a variety of gifts which he distributed amongst a very attentive audience. Not having a cable to connect the club ST to the projection TV made it difficult to demonstrate this incredible word processor to the entire group, however Gordon graciously led a smaller discussion while the meeting broke for intermission.

President Bill Rayl announced there would be a formal election to fill the position of Convention Manager in the January general meeting. The purpose of this position will be to pursue the possibility of MACE hosting an AtariFest in May. The decision to hold this convention has not yet been formally approved by the membership.

Door prizes were distributed by random drawing, the most notable of which included Word Perfect ST and the GOE cartridge. Other prizes included boxes of paper, disks and holders, T-shirts, library disks and software. Home-made cookies (courtesy of Pattie) and soft drinks were enjoyed by all until the meeting adjourned at 10 pm.

From Your President

The December Christmas Party was a success! I'd like to extend a sincere THANKS to **Gordon Mella** of **Word Perfect Corp.** for his excellent presentation under less than optimum circumstances (where is that Zenith Beam cable, anyway!?).

For those of you that missed it, Gordon told us a bit about the history of Word Perfect Corp. and the current freeze on ST development. He also gave away lots of goodies!

I'd also like to take this opportunity to personally thank each and every one of the local and national contributors that donated gifts for our party. Special THANKS go to **Total Control Systems** for donation of the 8bit grand prize of a *GOE Cartridge* and to **Word Perfect Corp.** for donation of *Word Perfect 4.1* for the ST.

Congratulations to MACE member **Randall White** who was the lucky winner of Word Perfect 4.1 and member **Joseph Nietupski,** the proud owner of one of the first GOE Cartridges available.

Looking ahead to our January meeting (Jan. 17), we hope to have a representative from **Soft-Logik Publishing** to talk about their *PageStream* DTP package for the ST. Also scheduled is an in-depth look at the GOE Cartridge for the 8bit.

Also at the Jan. meeting, we will be taking nominations and voting on a Convention Manager to help plan the Atari show which is tentatively scheduled for May 6 and 7 at the Airport Hilton in Romulus.

Hope to see you all at the meeting!

Bill Rayl

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the first Saturday before the 18th of every month at 2:00 pm at the Rudy Zauel Memorial Library on the corner of Shattuck and Center in Saginaw. Upcoming meetings are scheduled as follows: January 19. 1989, February 11, 1989

LeRoy Valley	President	686-6796
Marty Schmidt	Treasurer/Sec.	792-6029
Al Jennings	ST Disk lib.	790-1980
Ted Beauchamp	8 bit Disk Lib.	686-8872
Char Davis	8 bit Editor	686-4170

Club dues are $20 per year. For this fee you get the Atari Interface Magazine, support for both the 8bits and ST's, and full access to the clubs public domain library. We currently have 150 8bit disks and 70 ST disks. 8bit disks cost $1 each, and ST disks cost $2 each. Check your mailing label. If you need to renew or you haven't even joined yet, then do it now!

STill to Come!

MIDI and music is the topic for January! Mike Ranger volunteered to bring in his Yamaha PSS 680 keyboard and demo it along with EZ-Track on an Atari ST. This should be an interesting demo as the Yamaha has drum pads and contains over 100 different sounds! On the 8bit side, Ted Beauchamp will be demoing a public domain music program which supports the Atari Touch Tablet. The program offers more than 16 different instruments, and performs well with the touch tablet. I'll also endeavor to bring in a disk of the month containing (what else) music related software. This feature will be called 'Music Madness.'

The December Swap Meet and Christmas party turned out very well. We had a fresh pot of coffee (no surprises this time — Pattie – You know what I'm talking about!) and lots of goodies to eat. (Loved that apple coffee cake and all the cookies!) There was plenty of software and hardware for sale for both the ST and the 8bit. As usual, many people were taking advantage of the great deals and having a good time. It's merely a coincidence, but the swap meet is held just prior to Christmas. But poor Margaret, her hubby came along to keep watch over her after last years buying spree. And he did an admirable job!

The only surprise at the meeting was the Discovery Cartridge that LeRoy Valley brought. This cartridge allows you to back up ALL of your software. It handles everything that I've tried it on (which is more than I can say for the new version of ProCopy - 1.60), and also gives you the capability to read actual MacIntosh disks and convert them into Magic Sac format! This $200 cartridge offers more than the the $300 Translator!

Ted Beauchamp demoed NewsRoom for the 8bit. This program lets you create your own newspaper, and comes complete with over 600 graphics! won it. Congratulations Mike!

8 bit Equipment Volunteers for December: Ted Beauchamp, 800 XL, Disk Drive, Atari Touch Tablet Gerry Reno, Monitor ST Equipment Volunteers for December: Dan Mazurowski, 520 ST & Disk Drive LeRoy Valley, Monitor Neal Demo, Yamaha PSS 680 & EZ-Track

Remember, if you're bringing equipment, please bring all of the necessary cables (such as power cords, monitor cords, mouses, etc.).

USER GROUP INFORMATION FORM

Name: ______________________________

Address: ______________________________

City/State: ____________________ ZIP: __________

Phone: ______________________________

If you wish to receive information about one or more of the AIM participating groups, such as membership forms and disk catalog information, please complete this form and return it to:

Unicorn Publications
User Group Information
3487 Braeburn Circle
Ann Arbor, MI 48108

Please send me information packages on the following user groups:

☐ CACE ☐ CHAOS ☐ GAG
☐ GKAUG ☐ GLASS ☐ GRASS
☐ MACE ☐ TAG ☐ WAUG

I own the following equipment: ______________________________

The December meeting of the Washtenaw Atari Users Group was held at State Street Computer. The meeting was called to order at 8 p.m. by President Jon Brode who announced the feature topic would be Games/Entertainment. Jon also announced that WAUG has been approved as an officially recognized student organization at University of Michigan, which means the meetings will likely be moved. (The January meeting will be held at State Street as usual. Watch for further announcements!)

Jon reviewed some of the latest news concerning Atari computers, including a discussion about the ST Laptop. Librarians Mike Millage and Russ Crum announced disk specials, and Treasurer Dick Selke reviewed membership and financial status.

There was a demonstration of a game on two 8bit computers connected via joystick ports to allow opponents to play against each other. The game, Dual-Duel, is written in a graphics programming language called RGL. The author of the language submitted the programs for review to some members several years ago, then never returned to hear the results. (Aaron Pratt, if you're still alive, please contact WAUG!)

Several games for ST and 8bit were given out as door prizes, along with coupons for free library disks. The remainder of the evening was Free Form as members generally wandered around chatting and playing games on the computers in the store.

The feature topic of the January meeting will be Telecommunications, a great place to "get started" for all the people who acquired modems for Christmas.

Happy Holidays to All, From WAUG!

From the Prez...

Greetings fellow WAUGsters! It's a few weeks early for the State of the Union address, but AIM waits for no constitutionally prescribed dates. Things have gone well in the last year and we hope to make this year even better. We are on the verge of becoming an official student organization at the University of Michigan. If things work out, we will be provided with a meeting place, free of charge, and be given lots of money to play around with. We'd like to thank Robin Warner, proprietor of State Street Computers for allowing us to meet in his store while we were looking for a new home.

The topic of the January meeting will be Telecommunications. If you haven't come to a meeting lately, try to come to this one. We have had some excellent demonstrations recently, but unfortunately, attendance has been disappointing. So come to the meeting and bring along your favorite piece of telecommunications software to demo. We can't do it all by ourselves, we need your help. Special thanks to Harry Price for donating many disks to our 8bit library. Until next month, Jon Brode

From the Treasurer:

Our renewals for December were; Bob and Derek Fritz, Ken Antkowiak and Bill Root. These people know a good value when they see it! WAUG membership fees are $15, and may be made payable to: Dick Selke, 31139 Cooley, Westland MI 48185

From the Editor:

The next meeting of WAUG will be at State Street Computers, on January 10th, at 7:30. Information or answers to questions about WAUG can be obtained from the following two BBSs:

Molin's Den 420-0407
'Tari Forest 455-5616

Both of these BBSs support ASCII/ATASCII at 3/1200 baud, and are available 24hrs. Please upload any submissions to this column to 'Tari Forest by the 14th of the month. Use the ASCII save option of your word proccessor if available.

If you don't yet have a modem, you're missing out on a lot of free software, information and advice. Come to the January meeting for a sample of what you are missing!

Anton Malje, WAUG! editor

GLASS would like to thank the BASE Users Group (Bakersfield Atari Computer Enthusiasts) for permission to reprint.

The Creed

In the beginning there were fingers. And then there was an Abacus. And it was a start.

At this point in history, it was a long wait for silicon. We had to wait for a lot of small things like Ben Franklin, frying himself on a kite, Marconi, Jobs, the WOZ, and Bushnell.

And lo and behold, Bushnell discovered an Egg. And the Egg was called "PONG." And thus, the Home Video Game was born. And this added to the power that had been laid down by The Great Hackers That Came Before.

And finally Home Computers were born. And it was good.

But there was a dark cloud.

Once in their new homes, the Home Computer gave birth to the User. And the Users were alone in the wilderness. And they cried into the void. Finding no answer, they found themselves.

And the User Groups were formed. And it was good.

And they banded together. Tribe unto tribe. Each seeking it's own maker (or third party manufacturer). Apple unto Apple, Atari unto Atari, Commodore unto Commodore, IBM and it's clones, and Orphan unto Orphan.

A lucky few tribes found their makers. Most found nothing. Others were abandoned and know so. But still they came together. And it was good. The User Groups survived when the makers had forsaken them.

The User Groups came together in the dark and will be there until the door of obsolescence squeaks its hinges for the last time.

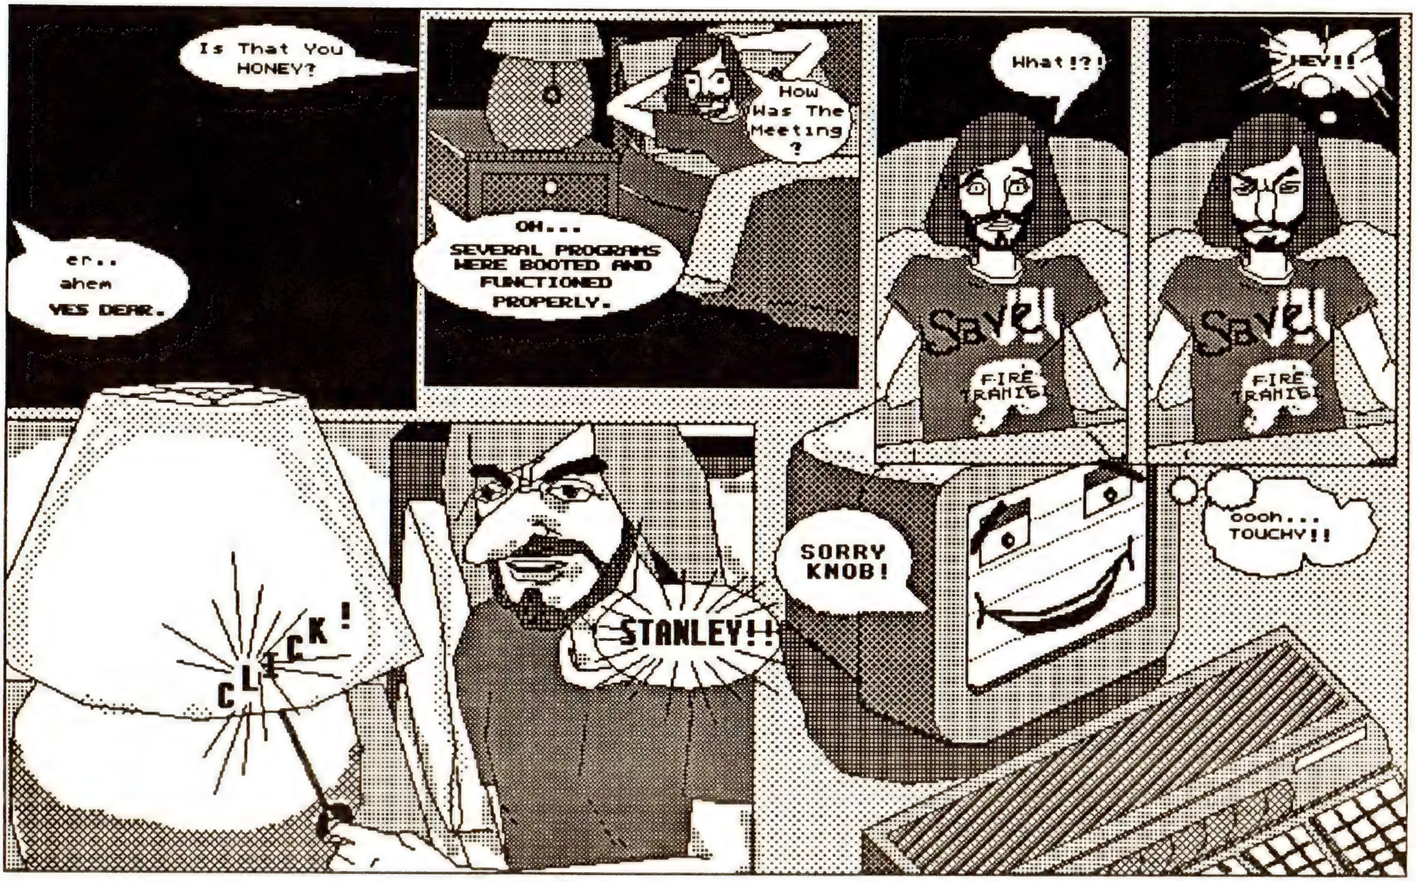
If you trust in the maker and he forsakes you, turn to your brethren. They will not forsake you. Seek ye out thy brethren for they shall help you find the light.

Yea, there are many soothsayers and false prophets that shall cause many doubts in your path and faith. Put your faith in your brethren for they have not designs on your soul (or wallet).

We banded together because we had no choice. We of the silicon tribes declare our allegiance to ourselves and our brethren.

"Let it be known from this time forward, we of the tribes do not bow down to any self serving God. For we will survive as we have always done, relying on each other and ourselves. Do not lie to us, for we talk to each other more than you will ever realize. Demi Gods come and go, trademarks last longer but even they can fade. Above all, we demand respect. For we are NOT the children of the computer industry. We are its FUTURE!"

If you would like to write to the BASE Users Group their address is PO Box 40203, Bakersfield, CA 93384.



Is That You HONEY?
How Was The Meeting ?
er.. ahem YES DEAR.
OH... SEVERAL PROGRAMS WERE BOOTED AND FUNCTIONED PROPERLY.
What!?!
HEY!!
CLICK!
STANLEY!!
SORRY KNOB!
oooh... TOUCHY!!

Ask Tim

by Tim Sharpe

I would like to thank my readers for the large volume of letters I receive each and every month. Regretably, I can't answer them all—but I shall try my best. And now, a question about computer piracy:

Q Last week I stopped at a convenience store to pick up some junk food on the way to my local computer club meeting. As I was coming out of the store, I nearly dropped a load of Twinkies as I watched three men quickly load my computer system into the back of a black pickup truck and take off. Has this happened to any of your other readers?

A Yes. It seems that computer piracy is at an all time high. The next letter demonstrates just how ridiculous this piracy problem has gotten.

Q I recently had a very unusual and frightening experience on my way to a computer club meeting. I had all my computer equipment loaded into the back seat of my car. At a stop light, a black pickup truck with a Jolly Roger insignia painted on the side pulled up next to me. Three men in pirate costumes carrying swords jumped from the back of the truck onto the top of my car. Two of them then jumped to the ground and entered the back seat of my car, while the third held his sword against my throat. After the two in the back seat had taken all of my computer equipment, the pirate holding me at bay withdrew his sword and slapped me in the face with a fresh fish. He then joined the others already in the truck and they all took off. Who WERE these people?

A Sounds like Bluebyte the pirate has struck again. This notorious villain is currently being sought by the FBI. He has no crime pattern and can strike anywhere at any time. So lock your doors and watch your back!

Q Is there something wrong with my computer if it smokes?

A No, but you should tell your computer that it is ten times more likely to suffer a premature death than a non-smoking computer. (You KNEW that one was coming, didn't you?)

Q I would like to enhance my ATARI 410 cassette recorder so that it runs faster. How would I go about doing that?

A You could try threatening it. If that doesn't work, buy a disk drive.

Q I have an opportunity to get an ATARI XL or a Soviet K1 computer system. Which should I buy?

A Take the ATARI XL. My Russian sources tell me that the Soviet K1 has only one kilobyte of RAM, one sound channel and can only be hooked up to a monochrome monitor. It's limited also by the fact that it is designed to run only Communist Party programs.

ANN ARBOR, MI

Some Spellers are Better than Others.

Before she won her regional spelling bee, Margaret Hollingsworth pored over seven different dictionaries for more than three hundred hours.

And while we'd all like to be champion spellers, most of us just don't have that kind of time.

So may we suggest putting the WordPerfect Speller in your corner.

Not only will the Speller check your document (or any section of it) for errors and double words, it will instantly count the words in a document, page, or block of text.

You can look a word up phonetically to find the correct spelling, and the Speller will give you a list of replacement words with similar sound patterns. Or if you're looking for just the right word, and you know it begins with "s" and ends in "-ology," use a wild-card character to replace the unspecified letters. The Speller will show you a comprehensive list of your options.

With the WordPerfect Speller (included in your WordPerfect software for the Atari), more than 115,000 words are at your fingertips. No other speller can match that kind of power.

Not even Margaret.

XF35 Kit

Convert your XF551 Drive to the newer 3.5" format. MASSIVE 720K storage per disk, EXCELLENT for: BBS, Hard Disk backup, and more! Supported by: MyDOS, SpartaDOS, and new SpartaDOS X Cartridge. Also works on ANY other DOS, in 90K, 180K, and 360K formats! Complete w/Upgrade ROM, adapting cables, and user instructions.

Price: Only $34.95

Requires 3.5" drive mechanism and mounting cage. Both are available from us. Please call for pricing.

Ram-Aid

For XL/XE with 128K (or more): Do Cold-Starts, AND keep data in Ram-Disks! No more wait to clear memory! Also compatible with: Newell and Rambo XL 256K upgrades

Price: 19.95 * Installed: 34.95

Ramdisk Utility

For Upgraded XL/XE (256K or more) 2 Disks (both sides); utilities, handlers, sector copiers, & more! Compatible with ICD'S Rambo XL! Complete with user docs, on disk.

Price: Only $10.00

The Immitator

For Happy 1050 owners: A direct replacement for the Happy 1050 Controller board (discontinued). ALSO has 2-color LED, to monitor write protect modes!

Price: 39.95 * Installed: 59.95

IC1050 Controller

For ANY 1050 disk drive! Write to back side of disks, WITHOUT "notching" them. Has 2-color LED to monitor Write Protect status! For standard or enhanced 1050's! (Doubler, Super Archiver, etc.) Plug-in connectors, NO SOLDERING!

Price: 29.95 * Installed: 49.95

CALL OR WRITE TODAY FOR A FREE CATALOG!

Easy Scan

Now, an Image Scanner for 8-bits! Transfer almost any picture, or graphics page into your computer! Saves the image as a standard 62 sector file! Excellent for: User Group magazines, posters, & more! Includes conversion utilities, to transfer your images to: RLE, Print Shop, Micro Illustrator, and Fun With Art formats!

Requires: 128K XL/XE, drive, and graphics printer (Epson, Star, Panasonic, and others) Flash: Now includes Graphics 9 capability!

Price: Only $99.95

ICX-85 Keypad

Works on ALL your software! NO handlers required! Great for: Word Processing, Spreed sheet, Data Base & more! Has the keys: Return 0-9 . , + - / *

Price: 49.95 * Installed: 64.95

ICX-85 Kit - For CX-85 owners (Hong Kong made) Only: 29.95

Deluxe ICX-85 - Also has Function Keys, for easy scrolling & more! Note: For XL/XE computers only!

Price: 69.95 * Installed: 84.95

Function Keys

The 1200XL was unique, having the Function Keys (F1-F4). You could do; cursor movement, lock-out the keyboard, turn off screen, turn off keyclick, use international characters, and more! Now you can Have all these on your XL/XE! Only 4 wires to solder! Includes user and technical notes.

Kit Price:14.95 * Installed:29.95
(Note: For XL/XE computers only!)

More Products!

128K for XE Game System - 54.95

From the Reader's Viewpoint

Dear Editor,

My name is Tim Feenstra, and I have been elected the new President of GRASS, the Grand Rapids Atari System Supporters. I am sending this letter to introduce myself and to let you know that I feel you have done a fabulous job of publishing MAM (now AIM). I have not heard any negative comments at any of our meetings, except the usual complaint of ST articles and reviews. I personally feel that for the most part, your 8bit coverage has been very good, with articles, reviews and modification specs that I have not seen anywhere else. In fact, the aftermarket OS modifications featured in the January issue has me thinking seriously about hot-rodding my XE into a multi-OS, expanded memory monster.

I would like to pledge my support to you in the upcoming year, so if I might be of service to you, please do not hesitate to ask. I will also stress to the GRASS membership that if they want more 8bit coverage, they should help by submitting informative articles and reviews to you. The world of the 8bit is not dead -- just a little tired -- and I await each new product with the expectation that soon the Atari will once again make a comeback in the home computer field.

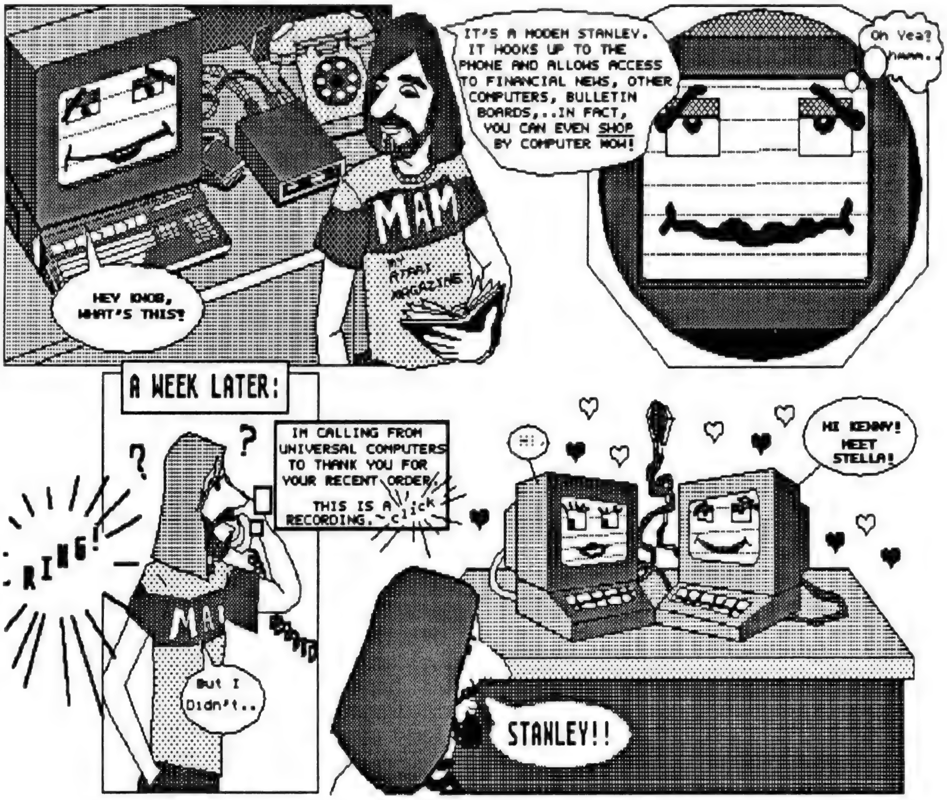
Keep up the good work. With internal problems resolved, I hope that the Atari Interface Magazine will continue to grow and expand into one of the finest publications in the country. You have a very good start, and I am proud that GRASS and myself have been able to participate, even just a little bit.

Thankx for a great magazine.
Tim Feenstra
President, GRASS

Dear Editor,

Thank you for your help on getting my 520ST fixed. Of all the Atari publications I subscribe to (six in all), MAM was the only one to tell me of Atari's Trade-in/ Replacement Policy. Because of the list you published in the July/ August 1988 issue, I was able to send in my computer and get it fixed. Thank you MACE and AIM!

Allan Frahm,
Hartman, Arkansas



IT'S A MODEM STANLEY. IT HOOKS UP TO THE PHONE AND ALLOWS ACCESS TO FINANCIAL NEWS, OTHER COMPUTERS, BULLETIN BOARDS,..IN FACT, YOU CAN EVEN SHOP BY COMPUTER NOW!

Atari News and Comment

by Bill and Pattie Rayl

News from Sunnyvale

It's been a relatively quiet month. Atari recently cancelled a Developer's Conference to be held in Sunnyvale, CA. A spokesperson at Atari stated the conference was cancelled because there "wasn't anything new" to discuss.

Though not yet confirmed by an Atari official, reports from outside sources indicate that Atari is looking to sell the Federated Group which was purchased in 1987 for $ million. Federated has posted serious losses in the last few quarters.

If you purchased a Mega ST2 recently, you may have difficulty upgrading to 4 megs in the future. Atari has shipped a batch of Mega ST2s with a new motherboard that does not contain the wave-soldered holes that would hold the extra bank of RAM. As one observer noted, "It looks like Atari is enforcing their upgrade policy -- if you want more memory, buy a new computer."

DOS XE, the DOS that was to accompany the XF551 DS Drive for the XL/XE computer line, is now available. Originally slated for public domain release under the name A-DOS, DOS XE is not PD and may be purchased from Atari for $10.

Third Party Releases

Soft-Logik Publishing has shipped version 1.5 of PageStream. Past versions of this desktop publishing package have been frustrating users due to many bugs in the software. SoftLogik claims version 1.5 is bug-free and Dave Groves, SysOp on CompuServe's Atari Forums says 1.5 is "solid as a rock." [$149, SoftLogik Publishing Corp., 11131F S. Towne Sqr, ST. Louis, MO 63123, (314) 894-8608]

Migraph has begun shipping Touch-Up, the virtual page graphic drawing program that may become the package of choice for all serious ST artists. With the availability to import Degas, IMG, GEM, MacPaint, PrintMaster and IBM PCX format graphics, Touch-Up will add flexibility to any graphic arts or desktop publishing environments. [$99.95, Migraph, Inc., 200 S. 333rd, Suite 220, Federal Way, WA 98003, (206) 838-4677]

The Tweety Board from Practical Solutions has been making a lot of noise. Easy to install, the Tweety Board gives ST owners a 3-channel outlet for crystal clear, stereo sound. [$59.95, Practical Solutions, 1930 E. Grant Rd, Tucson, AZ 85719, (602) 884-9612]

SofTrek has released version 1.4 of Turbo ST, the "software Blitter" that now speeds up many GEM applications as well as TOS and TTP programs. Benchmarked tests indicate the Turbo ST is as fast or, in some cases, faster than Atari's hardware Blitter. Purchasers of the older versions of Turbo ST can upgrade by sending in $5 and the original disk, or for free at your local authorized dealer. [$49.95 SofTrek, Po Box 5257, Winter Park, FL 32793, (407) 657-4611]

Have you been searching for a place that still carries the hard-to-find Synapse products for your 8bit? Search no more. It seems that a mailorder outlet had been established after Broderbund acquired the assets of Synapse. Many hard-to-find Synapse and Broderbund packages that may not be carried at your local dealer are listed in their catalog, including SynCalc, SynFile+, MindWheel, Breakers and Brimstone. For more information, contact Software Direct, PO Box 12947, San Rafael, CA 94913, or phone (415) 479-1185 (M-F, 8:30 - 5, PST).

Online News

Recent rate increases for Telenet's PC Pursuit has the telecommunication community up in arms.

In the past, users could access 25 cities nationwide for a flat $25/month fee with unlimited usage. PC Pursuit was very popular with SysOps of BBSes like Nite Lite, Ddial and other software which allowed linking up through PC Pursuit to connect "chat rooms."

To fight back against high-consumption users, Telenet has recently increased the monthly fee to $30 and on May 1, the rate structure will be $30 for the first 30 hours, $4.50/hr for each hour between 30 and 60, and $7.50/hr for additional usage. The service will still only be available from 6 p.m. to 7 a.m. and a good portion of your online time will be spent trying to connect to busy nodes.

PC Pursuit users have cried foul and organized calling campaigns to executives of PC Pursuit and US Telecomm, the parent company of both Telenet and US Sprint, as well as encouraging users to cancel PC Pursuit accounts and Sprint Long Distance services. The furor over the inpending price hikes sparked a national boycott of Sprint and PC Pursuit in the middle of January.

Peter Naleszkiewicz, Outdial Services Product Manager at PC Pursuit has attended conferences on smaller services such as Portal and People Link. PC Pursuit subscribers seemed angered, frustrated and disappointed with the response from PC Pursuit during the conferences.

One user says, "Telenet took advantage of the PC Pursuit subscriber base in their quest to block the recent FCC action — regardless of how you slice it, without PC Pursuit, there would *not* have been that massive letter campaign to the FCC offices and Congresspersons!"

If you would like to add your voice to the growing number of unhappy PC Pursuit users, you can contact Telenet President Paolo Guidi at 12524 Sunrise Valley Drive, Reston, VA 22096, (703) 689-5454.

A number of alternatives to PC Pursuit have been popping up. Galaxy Telecomm Division of GTC, Inc., the publishers of BBS Telecomputing News and Galaxy Magazine, have announced Galaxy STARLINK. STARLINK is an outdial service permitting off-peak calls to BBSes in 91 cities for a $10 monthly fee and only $1.50/hr of connect time. There is a one-time signup fee of $50. For more information or to sign up, boot your computer and dial (804) 495-INFO.

Another service is the Mnematics MNETwork that gives you the option of calling day or night for $4.25/hr with flat-rate, untimed service available in some areas. For more details, call Mnematics Customer Service at (800) 322-3633 or (914) 365-0184.

And finally, Tymnet is conducting a feasibility study on implementing a service similar to PC Pursuit. To contact them about their starting such a competing service to Telenet and to show your interest, write to E. Cabness, Tymnet, 2560 N. First St, San Jose, CA 95161, Mail Stop F-32.

User Group News

The Michigan Atari Computer Enthusiasts (MACE) of Southfield, MI, formally announced plans for an AtariFest to be held on May 6 and 7 at the Detroit Metro Airport Hilton in Romulus. Currently, MACE is contacting Atari ST and 8bit developers and finalizing details. For more information, see the MACE club section in this issue.

On a sadder note, many Atari User Groups across the country have been struggling to survive in the unpredictable Atari marketplace. In a recent newsletter received from the Twin Cities Atari Interest Group of Minneapolis, MN, the club president, Charles Grimsby, announced that TAIG held its final meeting on December 18.

The club's newsletter editor, Nathan Block, said, "I will miss TAIG, I will miss it very much. I cannot tell you how much I gained from TAIG. I met so many nice and intelligent people at the meetings and I have made some friends there as well... If I had money, I would donate every penny to keep TAIG going."

Nathan requests that anyone wishing to discuss TAIG's fate or anything at all, please write him at 2656 Georgia Ave. South, St. Louis Park, MN 55426. As Nathan says, "If we all stay together, that in itself is an Atari User Group."

The Making of a Magazine

by Bob Retelle (MACE,WAUG)

Because there's been some interest about just what's involved in producing a magazine like the one you're holding in your hands, I thought I might try to give an idea of what a typical month in the life of the Atari Interface Magazine is like. While I'm not an "official" part of the magazine, or Unicorn Publications, I see enough of what goes on to know just how much work it really is to produce something like this. My involvement, other than writing, is mainly in the area of "tactical support:" loading mail bags, filling out UPS forms, licking envelopes (yuccch!), and sticking on labels (yes, I confess...the fingerprints on your mailing label are probably mine!).

Creating the magazine is actually a fairly continuous process, but for this article, let's assume the previous month's magazine has just been delivered into the hands of the US Postal Service. This usually happens on or about the first of each month. After stopping to breath for a bit, the work on the next issue begins, which is where we'll start our tour.

The first step in creating the next issue is to make contact with the advertisers to get their insertion orders and space reservations. This can take three or four days of calling, calling back, and waiting for returned calls before everyone can be checked off the list. Instead of the three or four month lead time of the "big" magazines, where an advertiser has to submit ad copy far in advance of actually seeing it published, AIM works with a lead time measured in weeks. This can be something of a mixed blessing though, because while it allows the ads to reflect what's really available *now,* as opposed to what was hoped would be available when the ad runs, it can put pressure on the companies to get ads finished and in on time.

During this same time, the articles from the issue previous to the one which was just mailed out are archived and uploaded to both CompuServe and Delphi online services. Also, cover design for the current issue is looked at, to reflect any special theme for the issue.

As the advertising orders come in, the actual layout for the magazine can begin to take shape. Because the participating user groups receive AIM below cost, it's the advertising which pays much of the expense of publishing the magazine. Thus, the amount of advertising sold pretty much determines how many pages of articles can be budgeted for the month. The ratio is roughly one to three, that is, one page of advertising can pay for about three pages of articles. (When you contact a company which advertises in AIM, be sure to tell them that you saw their ad in the magazine. One of the eventual goals, as circulation grows, is to be able to give AIM to the participating user groups *free,* so helping the magazine grow will also be helping your user group!)

Part of the process of designing the layout is consideration of any changes to the overall style and look of the magazine, based on the issue just out. Ideas like greater use of graphics, changes in the number of columns per page and other style changes are worked on now, before the articles for the new issue are laid out.

The new articles and club columns will be coming in by now, either through the mail or by modem. With "electronic publishing," an article can be written, uploaded, edited, proofread, imported, laid out and finally printed in its final form, all without being "touched by human hands" (or blue pencils), and without a single drop of Whiteout correction fluid being expended! Often the entire process can take as little as several hours from a blank "sheet of paper" in the word processor, to the camera-ready copy from the laser printer. (The article you're reading now is a case in point!)

While the articles come in, hardware and software producers are contacted, to obtain copies of any new releases of their products which are distributed to the user groups to be reviewed for future magazines. Also, dealers are called to see if they'd like to carry AIM in their stores. This increase in the magazine's circulation not only helps by giving the advertisers more exposure for their ads, which could help lower the cost to the user groups, but can also directly benefit the clubs in other ways. Your club's articles and columns are now being read by Atari owners from Maine to California.

It may not be very likely that Michigan user groups would pick up new members from other states (though that has happened), but they *might* be interested in buying disks from your club's library, for example, if your club uses its column to publicize its library. If you know of a store that doesn't carry AIM, you can help your user group and the magazine, by showing them a copy of AIM, or by sending the store's name and phone number in to the publishers. This kind of growth, along with the possibility of adding new user groups, means greater circulation and more advertising, which means more pages, for more articles and more club news!

Actually, these kinds of contacts, and the contacts with advertisers is more of an ongoing thing. It's just that while there's a "lull in the action" of putting the magazine together that they can be concentrated on.

Before long, it's the 17th... deadline for the issue.

At this point, things change from the more abstract endeavors to the concentrated desktop publishing activities which result in the physical magazine. The first thing done is archiving the last month's issue to keep it "on file," and to prepare this month's magazine disk. Each user group has its own folder on the disk, and the articles and columns are put into the proper folder as they come in.

The articles may be in several forms, from straight ASCII text files to any of a number of word processor formats. Each one is loaded into STWriter to be edited and proofread, and then saved as an ASCII file. The articles are also spell-checked by the computer, even though the pages are also proofread "by hand." This process of editing the text usually takes about a day.

By now, a complete list of ads and articles has been made up, so the layout of the magazine can be finalized. Generally, related articles such as reviews or those following the issue's theme are grouped together. Ads smaller than a full page are selected to fill out the pages and present a pleasing appearance.

The last things put together are usually the table of contents and the editorial and "Atari News" pages, so the layout begins with the first of the regular articles. Just as the number of ads determines the total number of pages in the magazine, the amount of material sent in by the clubs for their individual user group columns determines how much space can be devoted to general articles. Within reason, the publishers will print anything the clubs care to send. If necessary, articles written by non-user group authors (if any) will be cut first, as well as articles written by the magazine staff, to accommodate the club material. If space is still tight, longer articles may have to be split and run as a two-part series, or held over for the next month's issue. (If the space devoted to your individual club seems smaller than that of other clubs, it's likely because your club didn't send in as much as the others. Now would be a good time to represent your user group by taking "wordprocessor in hand" and writing an article!)

Getting into the more "technical details," the magazine used to be created on SoftLogik's Publishing Partner, but now Publisher ST from Timeworks is used. A new version of PageStream, also from SoftLogik, has been released, and assuming there aren't any more serious bugs, it will probably be used in the future.

One very nice feature of the Timeworks program is the speed at which it prints each page. When using Publishing Partner on a half-Meg ST, only four pages could be loaded into memory at one time, and each page took 20 minutes to print! Can you imagine how much fun it is to set up 4 pages to print, then go to bed with the alarm set to wake you up in an hour and a half so you can load in the next set of four pages? A 40-page magazine could take most of an entire day just to print out. With Publisher ST and a used 2-1/2 Meg 520ST now, the entire printing operation takes far less time. Each page only requires 5 minutes, and about 10 pages can be loaded at once. The biggest drawback to using Publisher ST is that the program uses GDOS, so its fonts are limited to the sizes you have on hand. With Publishing Partner, you could re-size the fonts to just about any intermediate size.

At any rate, the articles are imported one by one into Timeworks' Publisher ST and adjusted to fit the columns by manually adjusting the hyphenation. Any graphics or pictures are imported into the articles, and space is left for ads which will be added to the pages later.

One interesting shortcut that can save a lot of time when doing a regular monthly layout like this is to make use of the previous month's pages, instead of creating an entirely new layout every time. Since the layout is standardized at three columns for the first page of an article, and two columns for additional pages, it's possible to just load in an "old" article, then delete the text from the columns. This leaves the pages and columns all set up and ready to import the new article. New graphics can be added to make each layout unique for the month. After adjusting the text to fit, the headings are changed for the new article, then the process can be repeated for the next article.

When the pages are finished on the screen, they're printed out for a final check. It's a little ironic with all the talk about "electronic publishing," but it's actually a lot faster and easier to go over text on paper than on the computer's monitor screen. If any errors are detected, they're corrected and printed again. (Incidentally, the magazine is being printed on a Hewlett Packard LaserJet II printer with 1.5 Megs of internal memory.)

Among the last things to be written are the Editorial for the month, and the Atari News pages. All month long, news sources like the Atari Forums on CompuServe, the Atari SIGs on Delphi, various UseNet newsgroups and many Atari related publications including user group newsletters from all over the country are watched for new developments and rumors that may be of interest to the readers of AIM. The close contacts with the advertisers and other third-party manufacturers are also good sources. All this information is distilled at the last minute to make sure it's timely and up to date. Finally, the Table of Contents is created from the actual pages of the magazine.

These pages are printed and checked, then the magazine's cover is finalized and printed. Depending on the theme of the issue and the content, the cover may be created directly in the desktop publishing program, using EZ-Draw, or by importing a DEGAS picture. In the case of actual photographs, space is left for the photos, which are added later by the printer.

The last step in the creation of the magazine is to manually add the advertising copy and the user group logos and headings for the individual user group columns by "waxing" them to the pages using a special heated layout wax applicator. (Sort of looks like your grandmother's antique curling iron!)

By now it's about the 22nd or 23rd of the month, and it's the printer's turn to work on the magazine. It's about an hour's drive up to the print shop in Fenton, but he does a better job, for less money, than the ones closer in. It takes about six working days at the printer, so the magazines are usually ready on about the 29th of the month.

During this week the laundry gets done again, along with planning for the *next* issue. (The actual production of the magazine is a very intensive process, sometimes involving 24 hour days to get it all done in time. Any problems or holdups can result in missing the goal of mailing the magazines out on the first of the next month. The Christmas and New Year's Holidays were a nightmare!) This time is also used to check on articles for the next issue, and to gather the mailing labels for this current issue from the member clubs.

After picking up the magazines from the printer, the process of mailing the issue out begins. (This is usually where I come in...those boxes are *heavy!)* Each club provides mailing labels for the magazines to be sent to its members, and any it wants sent to other user groups around the country. The labels are divided into Zip Code areas so they can be sorted, then they get stuck on to the freshly printed magazines (this is where my fingerprints usually become enshrined forever on your mailing label). The magazines are sorted, collated, flipped, flopped and finally bundled (with heavy twine, tied twice around each dimension), then counted and bagged (destination city on top). With all the regulations, restrictions and specifications the Postal Service puts on mailings like this, I'm surprised they don't want us to just drive them out to your house too!

The mailing to the clubs usually takes most of the day, and if all's gone well, the bags are deposited on the loading dock in Ann Arbor before 5 p.m. on the first of the month. The next day is spent preparing UPS packages of magazines to be shipped to Atari dealers all over the country, usually 6 or 12 magazines per package. Somehow, no matter how good our intentions may be, we manage to hit the UPS desk with 35 packages at what feels like 5:59 on a Friday evening. After many months of doing this, the people in the UPS office growl at us on almost a "first-name basis," but the packages get out. (I don't think I've ever personally spent more than $1.25 sending anything by UPS...it's awfully scary to watch the cash register come up with a $125 bill just for shipping, and the Post Office bill is even worse!)

And the next day, it all starts over..!

(Just one final note... I've been watching this magazine come together monthly, for over a year now. It's a fascinating process to watch, but one thing that's been very evident is that it's a *lot* of work. It's not a "Get Rich Quick" kind of thing, it's not even a "Get Rich Slowly" thing. It's the kind of thing done out of love for the journalistic challenges and dedication to the user groups it serves, and I've been very happy to have been even peripherially involved.)

Beckemeyer Development Tools
478 Santa Clara Ave. • Oakland, CA 94610
Serving the Atari ST Community Since 1985

Hard Disk Toolkit $29.95
Fast, Reliable Disk Backup
- Backup files too big for one floppy disk
- Automatically formats on the fly - up to 4Mb per disk
- Up to 1Mb/min - no need for 1Mb RAM or RAM disk
- Restores files even from damaged floppy disks
- Tells how many disks are needed in advance

Hard Disk Sentry $49.95
Repair & Optimize Disk Partitions
- Invaluable to Hard Drive users - also works on floppies
- Typically takes less than one minute for all partitions
- No programming experience required - fully automatic

Hard Disk Accelerator $39.95
Hard Disk Cache
- Dramatically speeds up Hard Disks using little RAM

MT C-Shell $129.95
Multiuser/Multitasking Operating System
- Fully TOS compatible - runs GEM programs!
- Up to 12 users with optional multiport controller
- E-Mail & UUCP networking available

Orem, Utah

by Gordon Totty (MACE)

Famous cities of the world include Chicago -- hog butcher of the world, Detroit -- the motor capital, and Cincinnati -- famed for a dancing pig, who was the barnyard's Mr. Big. (If you remember that song, then you are (1) as old as I, and (2) demented.)

My nomination for a famous city of the world is Orem, Utah. For those who do not know where that is, it is near Lindon and Pleasant Grove, between American Fork and Provo, about 45 miles south of Bountiful, and west of the Uintah and Ouray Indian Reservation. Give up? Look 35 miles south of Salt Lake City.

Orem, Utah is the home of one of the best software houses in the world, WordPerfect Corporation, specialists in word processing and word processing related software. This article is not a review, it is a love letter to WPC for bringing WordPerfect to the Atari ST market, small though that market appears to be.

The motivation for this article came from the December meeting of MACE. We had a representative of WPC in attendance to describe the software and answer our questions. There were between a hundred and two hundred of us there. I did not count noses, but am estimating based on what the crowd looked like. What I did count was the number of hands that were raised when the representative asked how many owned WordPerfect -- just three of us.

WordPerfect is expensive, by Atari standards. Atarians like games anyway, not word processors, right? Who needs to spend $175 to $250 on a word processor, depending on source, when you can get STWriter Elite for little more than the cost of the disk it comes on? I understand all the reasons why WordPerfect does not seem to be selling well in the Atari market. Not the least of them is the size of the market, limited in the US by Atari Corporation's supply, marketing, and distribution problems. Alas, what a shame.

The shame of it all is that WPC came to the Atari market with higher hopes. They had planned to release the WordPerfect Library next, like they have already done for the Amiga. The Library includes a very nice set of related programs, especially the calendar for tracking appointments. It also includes a calculator, file manager, notebook, program editor, and macro editor. Plans like this have been shelved at WPC, while they wait to see what happens to the size of the Atari market. They are, like many of us, waiting to see growth.

The Atari version of WordPerfect is 4.1, two versions behind the latest and greatest WordPerfect 5.0 that is getting headlines in all the PC related magazines. Version 5.0 had been considered for the Atari market at one point. Not now. It is a major, and I presume expensive, upgrade from the 4.1 Atari level. (Version 4.2 is the other one before 5.0 and was, in my opinion, only a small step above the 4.1 version.) Why should WPC invest any more money in the Atari market?

They certainly would if a lot of Atari computers existed, and a lot of Atari owners were demanding and willing to buy the best software.

Our guest speaker told us, if I remember correctly, that WordPerfect has been modified to run on 17 different "platforms." The folks from Orem, Utah will market that product anywhere that it will sell sufficiently to pay them for the effort. I hope that the Atari market changes enough to encourage WPC to start on a 5.0 for the Atari.

Have any of you visited a B. Dalton computer store? How about Egghead Software? Neither carry Atari stuff. Software Boutique carries a few Atari titles. In any of these three stores, however, you will be able to get a feeling for what we Atarians are missing as you browse the IBM and Apple software displays. You will feel good as you recognize many packages that are available to you. But, you will also see many -- far too many -- fine products that are not available to you. WordPerfect is not in this latter group. WPC dared to "cross the line" and make the best word processor in the world available to you. (There is dispute over which word processor deserves to be considered best. I think all the debaters of the point would agree that if not the best, WordPerfect is one of the two best.) Buy it, before it is too late.

If you are not a WordPerfect owner, you do not know what you are missing! This product has so many bells and whistles I have not yet used many of them. For instance, each of the function keys has four uses, for a total of 39 functions. No, this is not new math; one of the functions is not implemented on the Atari.

WordPerfect comes on six disks, and is a little difficult to install if you have only one disk drive. But, I did it, and if I can anyone can. It works well with two disk drives, and works like a dream with a hard drive. It is completely "moused," and can be used with no difficulty without the mouse. I first learned to use it in the big blue world, at work.

This article is not supposed to be a review, and so I do not want to go into more detail. One reason is that I sold a review to another publication, and do not want to violate a trust. I assure you, if you are a serious word processor, you will *not* be wasting your money if you buy WordPerfect.

This article is supposed to be a love letter to WPC, so let me get on with that part. In my experience with vendors of software, hardware, and products and services of all kinds, I have never received service like I am getting from WPC. They promise lifetime customer support, with toll free numbers for you to call for help, and that is what they deliver.

Sticking just to computer hardware and software products, here are some examples of "help" I have received after I paid my money for something:

- No response to a four page letter. (Don't have time to read long letters.)
- No response to a one page letter asking what happened to the four page letter. (Don't have time to sort hundreds of letters looking for one.)
- "Gee, I don't know." (Uninformed, but honest reply. Bothers me when I have paid for support.)
- "Gosh, it's supposed to do that!" (Evasive. Questions my concern.)
- "Golly, it's not supposed to do that!!" (Evasive. Questions my concern, but makes me feel like a pioneer or discoverer.)
- "Ask your merchant." (He's supposed to give you the support; don't bother us.)
- "Write to the manufacturer." (I just sell this stuff; I don't write the programs....or give refunds on opened software.)
- No response, because the company has gone out of business. (A characteristic "response" in the software business!)

I hope the above does not make me appear hostile to the many excellent manufacturers, developers and vendors. I understand that you must give up something to get power without price, and full customer support is expensive. I am not looking for something for nothing. I just want to illustrate and contrast the difference between scanty and full support. Now, to get on with it, here are some examples of help I have received from WPC. To get help from WPC, you are instructed to be calling from your computer with the software loaded.

1) I couldn't load the printer driver because the manual is lacking in respect to instructions for this. (Believe me, the more than 600 pages of documentation lack little.) I called, and a very friendly person talked me through the whole procedure, step by step. When I hung up, the job was done. No more waiting. No hoping that I had listened carefully enough and taken the right notes. Done. Nothing more to do. Ready to print.

2) In another instance, I needed another printer driver for a printer that was not listed among the couple of hundred that WordPerfect supports. I called, and another friendly person selected the printer driver closest to the one I needed, based on a list that she had, and then modified it for me. This was done with me looking in my manual for codes that she told me how to insert in the driver on my disk. "On line..." "Real time..." Again, no waiting or further worrying. Fixed during a phone call.

3) I got a new printer and loaded the printer driver for it. After a while, I noticed that six characters were not printing. While on the phone with WPC, the appropriate character table was found and edited. Problem fixed. And, during the fixing of this problem, I learned how to "program" any key I select to print any character that the printer is capable of printing.

Examples of good customer support like the above represent a two-edged sword. Some will say, "For what it costs, you shouldn't have had these problems." Perhaps. But, given the problems, I defy you to find another company that handles customer help like WPC does. They excel at this. It is part of what they sell you. It represents significant value to you.

WordPerfect was released to the Atari market before it was really ready. The first versions were "buggy." Has this ever happened to you before? What did the company do? Sell you an upgrade? Not WPC. They will send you the upgrade free, probably without you having to call and ask for it. They have not committed to sell you what is in the box on the day you buy it. They committed to sell you a bug-free version of a world-class word processor and lifetime customer support. What a deal!

I cannot say enough about the good people from Orem, Utah. You will note that they have obviously converted me into a missionary for their product. But, love letters can get boring to "outsiders" so I'd better bring this one to a close.

I just wish their marketing gamble had paid off so handsomely that other big time outfits were anxious to cross the line into Atariland too. Well, maybe someday. I can dream....

Some Spellers are Better than Others.

Before she won her regional spelling bee, Margaret Hollingsworth pored over seven different dictionaries for more than three hundred hours.

And while we'd all like to be champion spellers, most of us just don't have that kind of time.

So may we suggest putting the WordPerfect Speller in your corner.

Not only will the Speller check your document (or any section of it) for errors and double words, it will instantly count the words in a document, page, or block of text.

You can look a word up phonetically to find the correct spelling, and the Speller will give you a list of replacement words with similar sound patterns. Or if you're looking for just the right word, and you know it begins with "s" and ends in "-ology," use a wild-card character to replace the unspecified letters. The Speller will show you a comprehensive list of your options.

With the WordPerfect Speller (included in your WordPerfect software for the Atari), more than 115,000 words are at your fingertips. No other speller can match that kind of power.

Not even Margaret.

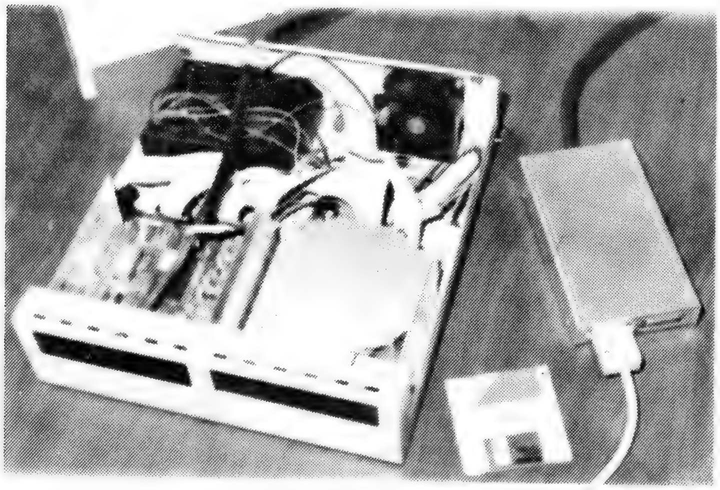
Building a Hard Drive for Your ST

Using a Kit from Tech Specialities, the Drive may be Hard, but Building it isn't!

by Bill Rayl

About eight months ago, the gods smiled upon me. A friend of mine, who happened to own an IBM clone, decided his 20 meg hard drive was too small. He moved up to a 60 meg drive. No longer having use for the old hard drive, he offered it to me at a price I couldn't resist -- free! I spent about .032 nanoseconds before gladly accepting the drive.

So, there I was with an Epson HD-860 half-height, 20 meg drive with no cables, power supply or case and no documentation. A call to Epson remedied the documentation problem. They gladly sent me a Product Manual and Maintenance Manual. I was also informed that a number of HD-860 drives had had problems and the drives were no longer in production. Still, free is free.



The next step was the biggest -- choosing a hard drive kit. After shopping around and comparing pricing, quality of parts and knowledgeability of the people I talked to, I finally decided on a hard drive kit from Tech Specialities of Houston, Texas.

The first time I called Tech Specialities about their kits, I spoke with Ky Vaumund, the owner and chief engineer. Having never attempted building a hard drive, I had lots of questions and Ky answered them with ease. Most importantly, his answers were simple and easy to understand. He made it all sound simple. I was sold. I chose the 13.25"x 15"x3.8" kit with 55W power supply, 115V fan, full SCSI/ DMA through host adapter, and room for three half-height drives. (price:$295)

In less than two weeks, the kit arrived at my door. Upon opening the box, I was surprised to find the entire kit had already been assembled! I had expected a jumble of cables, parts and numbered diagrams that I'd spend hours sorting out and staring at. Not so!

Upon opening the Mega ST-sized case, I found that all the cables were already connected. The host adapter, which interfaces the SCSI hard drive controller to the ST's DMA port, was actually an ICD host adapter with built-in battery-backed clock and an extra DMA port for daisy-chaining! Included in the box was the ICD hard drive utilities disk and 24 pages of docs that discuss building a hard drive with the ICD controller. Most of the documentation wasn't necessary, since the kit was already assembled except for the hard drive itself, but the docs had lots of interesting info in those 24 pages.

After spending about five minutes with the docs, I simply dropped the hard drive into one of the slots in the kit, plugged in the 20-pin and 34-pin drive cables and connected the power. During all this, I kept thinking it couldn't be this easy!

Then, I plugged everything in, turned on the drive and the ST and went to format the drive. Surprise -- the ICD software didn't list the Epson drive in the format options. Back to the docs and the section describing how to add a drive's specifications to the formatter. Between the docs and the Epson Product Manual, I got the information needed and in less than 10 minutes I was formatting away. In under 15 minutes, I had built a 20 meg hard drive, formatted and partitioned it and was busily installing my software!

It's been over two months now since the drive was built, and I haven't had a single problem with it. Now, all I need is for my IBM friend to decide his 60 meg drive just isn't big enough. After all, I still have room for another hard drive or two in the case!

For 520ST. 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.

Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A:Socketed, no RAM	$ 129
520B: 1 MB, socketed	$ 299
520C: 2.5 MB, socketed	$ 595
520D: 4MB	$ 995
520-1:1 MB, non-expandable	$ 249
1040A: 1 Bank sockets, no RAM	$ 110
1040B: Fully socketed, no RAM	$ 149
1040C:2.5 MB + 1 bank sockets	$ 595
1040D: 4 MB	$ 995
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 12-19-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.

Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available! Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

The XF551 Enhancement

by David Bryant (GKAUG)

How many of you have taken your trusty double sided floppy disk, punched a write protect hole in the jacket, and flipped it over to write on the reverse side? If you're like me, you've done it several times. So I thought nothing about it when I got my XF551 disk drive. I just put the disk in and loaded those basic programs like nothing was different.

I was wrong. The first time I went to format a disk, (using Atari DOS 2.5) the drive protested and gave an error #173. I also had problems trying to write to the back side of disk in the XF551. I then got a gift from a friend, a modification for the XF551 allowing it to operate like a 1050. Now formatting or writing to the back side of disks is no problem. This handy mod is called The XF551 Enhancement, from Computer Software Services.

If you look at a disk, you will see a small hole near the large hole in the center. This is the index hole and some drives use it to tell when it is at the beginning of a track. The 1050 does not, so when you flip the disk, it doesn't matter if there is no hole. The 1050 uses a signal from the RAM I/O Timer chip to provide the index pulse to the Floppy Disk Controller chip.

The XF551 uses a index hole sensor to provide the index pulse, and that's where this kit is needed! After you install it, a switch on the back of the drive allows you to choose XF551 or 1050 mode. So you don't have to punch write protect holes in the jacket anymore.

The kit consist of an epoxy shell with the circuitry and a switch. About seven wires are connected to the circuit board and write protect sensor inside the XF551. Instructions included with the kit are easy to follow. I would remove the circuit board from the drive when soldering to the IP jumper. I located the switch above the Drive Select Switches and the epoxy shell next to it inside the rear cover. Everything goes together easily.

I wish to thank Computer Software Services, current cost is $29.95. Installation is available. They may be contacted at: 465 Kilbourn,. Rochester, NY 14618

XL Keyboard Mylars in stock now! $22 ea
In Stock 130XE Cartridge Connectors $6.30
Many people have asked which Mailing List program we use at Best Electronics, we currently use Super Mailer+ from Royal Software. Super Mailer program (D) $39.95
XL to XE Software Compatiablty Mod by Tom Lawless. This two chip/switch mod is for enhanced 800XL computers (256K-512K). $8
Hardware upgrade kits and P.C. boards that require the 41256K ram chips have been put on hold because of the high price of ram chips. We hope to ship again once ram chip prices start to drop down!

Bring a Modem into Your Life

by Patricia Snyder-Rayl

Ok, I'll admit it. I'm the telecommunications junky in the family. I'm always in the weekly conferences in the Atari areas on CompuServe and Delphi. It was for my benefit we started a bulletin board service (BBS) in the first place.

All this fanaticism doesn't make me an expert on modems, but I've certainly used my share of MOdulating/DEModulating devices, from a 300 baud Atari 1030 to a 1200 baud HabaModem (with only one LED to indicate the modem was plugged in) to several sleek, new 2400 baud modems.

The Baby Blue 24 Modem

One of these new boxes is both small in size and price tag. It's the Baby Blue 24 external modem available from Irata Verlag. For the color-conscious computer owner, the light (baby) blue modem accents the battlegray of the ST or Mega. For the quality-conscious computer owner, the Baby Blue 24 is an exceptional bargain and workhorse, not to mention its 5-year warranty.

Currently, Irata Verlag is offering this 2400 baud modem for only $135, and all you need to add is the RS-232 modem cable to join the masses of telecommunicators out there. Ok, you'd need a terminal program too. (If you ask 5 ST owners which software is best, you'll get 5 different answers, but my favorite and recommendation is Flash!) The modem is also small in size, measuring 6.5 inches long, 4.5 inches wide and 1.5 inches tall.

Our BBS, The Treasure CheST, is now running day and night off the Baby Blue 24 modem, and there hasn't been a single problem. In fact, one caller commented that the lines to our BBS had suddenly become clearer and he was experiencing less line noise! He wanted to know if we had changed the phone line, and was surprised to find out the only difference was Irata Verlag's modem.

The Baby Blue 24 uses the full Hayes command set (the commands sent to the modem telling it what to do -- like ATDT is dial out in tone mode), and one nice feature is you don't need to type the commands in upper case. The modem also understands extended result codes, and the documentation says the modem is compatible with Bell 103 and 212A, plus CCITT standards.

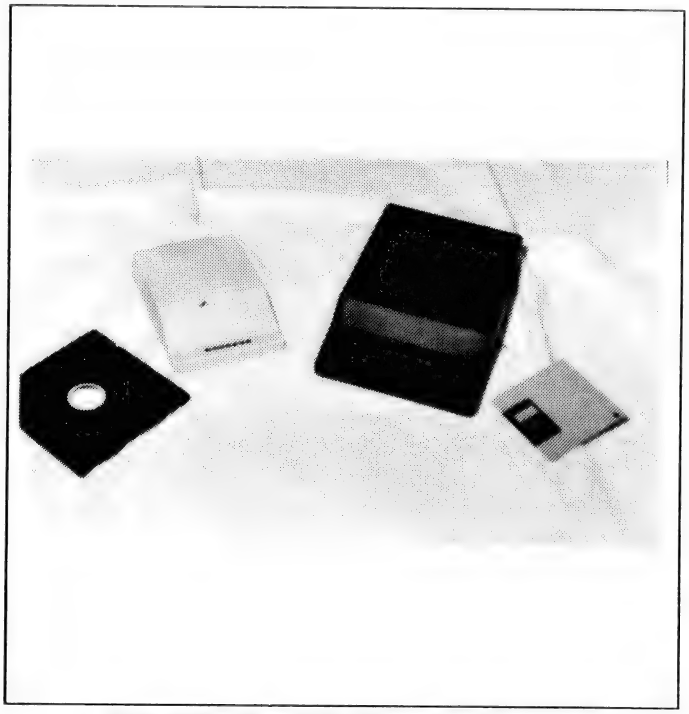
On the front of the Baby Blue is a row of LEDs. There are seven altogether -- one for Auto Answer, one to tell when a call comes in, one to indicate transmitting data, one to indicate receiving data, etc. There are also four DIP switches on the modem, giving you the option of setting the modem with these rather than through your software. The modem also has non-volatile memory if you wish to store your phone numbers in the modem instead of in your software package.

One last, but necessary feature, is an internal speaker. This speaker can be set to three different volume levels, not including on and off. Such a speaker is invaluable to hear the BBS you're calling has changed numbers or is simply no longer in service.

If some of these terms are not familiar to you, there is a glossary of terms in the back of the documentation for the Baby Blue 24. The documentation is over 40 pages, and has charts detailing S-registers, the factory default settings of the modem, the RS-232 pin assignments, and even ASCII character values in hex and decimal.

The Data 24 Modem

Irata Verlag is also distributing an upgradable 2400 baud modem. This modem is called the Data 24, and is an Incomm Turbo 2400 baud modem in disguise. It's size and price tag are larger than the Baby Blue 24, but you get the ability to add boards to increase speed, without having



The Baby Blue 24 & Data 24 Modems

to throw away your current modem. With the Data 24 modem, you can add 2400 baud error correction or go all the way up to 9600 baud!

This modem also has a 5-year warranty, four DIP switches, Hayes commands and extended result codes, internal speaker with variable settings and battery backed-up memory. This modem has 11 LEDs however, and the documentation includes appendices dealing with commands only available with the upgrades.

The documentation I had did not say how much the upgrades would cost, how the modem is constructed to accommodate them or what the procedure to upgrade involves.

We've performed the ultimate test on both the Baby Blue 24 and the Data 24 by running them for several days, at 24 hours per day. Both modems came through with flying colors! Neither modem had a problem communicating with the BB/ST software from QMI, Flash! or with the different services we call regularly.

My personal favorite is the Baby Blue 24 modem, but the Data 24 would be good for someone who has a little foresight and plans to go to higher speeds. For more information on the availability and prices on these fine modems, please contact:

Irata Verlag, PO Box 69-5530, Miami Beach, FL 33269
or phone 305-652-1038.

2400 BAUD MODEM $135.00

OUR BABY BLUE IS FULLY 100% HAYES COMPATIBLE USING THE STANDARD "AT" COMMANDS. THIS MODEM HAS FULLY TESTED WITH THE ST, AND MOST OF THE PROGRAMS MADE FOR COMMUNICATION. IT IS A SMART MODEM, GREAT FOR BBS. IT HAS AUTO ANSWER, AUTO DIAL (TONE OR PULSE)

OUR BABY BLUE HAS 5 YEAR WARRENTY

NO OTHER MODEM HAS SUCH A LONG WARRENTY, WE BELIEVE IN WHAT WE SELL AND BACK IT UP.

PEOPLE WHO LOOK AHEAD, HERE'S THE MODEM FOR YOU, THE EXPANDABLE MODEM " THE TURBO 2400" THIS MODEM IS FULLY "AT" COMPATIBLE (HAYES)

THIS MODEM IS UNIQUE IN THAT IT IS UPGRADABLE TO AN ERROR CORRECTION 4800BPS, 9600BPS. NO LONGER YOU HAVE TO GO OUT AND BUY A NEW MODEM WHEN YOU GO UP IN SPEED. 2400EC MODEM USES CLASS 4 MNP (MICROCOM NETWORKING PROTOCOL) THIS MODEM TAKES THIS PROCESS ONE STEP FURTHER AND COMBINES CLASS 5 WHICH OFFERS 2 TO DATA COMPRESSION FOR BETTER TRANSFER AND RETRIEVIEL OF INFORMATION. (5 YEAR WARRENTY)

EXPANDABLE 2400 MODEM..$165

EXPANDABLE 2400 MODEM..$245 (WITH ERROR CORRECTION)

SCANNER

THIS IS A FLAT BED COPIER FROM SILVER REED IN EUROPE WE CONVERTED AND CREATED SOFTWARE FOR THIS COPIER TO TURN IT INTO A GREAT SCANNER. WE SELL THEM FOR $800 COMPLETE. FOR PEOPLE WHO LIKE DOING THINGS THEMSELFS WE SELL A KIT, WHICH IS THE BOARD AND PROGRAM FOR $250. YOU CAN BUY THE COPIER FOR $200 WHILE SUPPLIES LAST (1-800-221-7774) FROM DISCOUNT STORE. WHEN SUPPIES ARE GONE, THEN I WILL START TO BRING THEM IN AND THE COST WILL BE $800-$850. THE BOARD IS SIMPLE TO INSTALL 12 WIRES TO SOLDER AND A MAGNET TO GLUE. THE GREAT THING ABOUT THIS SCANNER IT PRINTS AS GOOD IF NOT BETTER THEN A LASER PRINTER. THATS JUST AN ADDED FEATURE. THE QUALITY OF THE SCANNS IS SO GREAT, IT LETS ALL OF THE ST OWNERS. HAVE THE FREEDOM TO CREATE WITHOUT SPENDING LOTS OF MONEY. OUR SPAT PROGRAM IS SO GOOD, THAT WE ADDED PRINTER DRIVERS. SO PEOPLE WHO DON'T HAVE A SCANNER, WILL BE ABLE TO CREATE AND PRINT OUT PAPERS OR NEWS LETTERS. THIS IS ONE OF THE SIMPLEST PROGRAMS AROUND

SPECIAL

S.P.A.T. & PIC READER $50

DISK BACKUP EXPERT ⟷ READ MAC DISKS FAST

The DISCOVERY CARTRIDGE is a sophisticated hardware device based on the powerful HART chip, custom designed by HAPPY COMPUTERS. The Discovery Cartridge system is the disk backup expert, so you don't have to be.

Just read what our customers have said.

"Out of the box, my Discovery Cartridge copied every disk, even the newest European copy protection."

"The Discovery Cartridge's custom formatting and disk backup capabilities are awesome! It is 10 times better than the Copy II PC option card for the IBM. It totally blows away software programs like Procopy."

The Discovery Cartridge restores your legal right to have a backup of the programs that you purchase. No damage to your equipment or disks will occur when you use the Discovery Cartridge to copy the disk, regardless of false claims to the contrary. Using our unique image file system, you can create first generation backups now and forever, even if the original disk is damaged or no longer available.

No other software or hardware device for your Atari ST computer can even come close to the copying capability of the DISCOVERY CARTRIDGE. The DISCOVERY CARTRIDGE can even backup copy protected disks for other computer systems besides the Atari, such as Amiga or IBM PC.

The advanced user can explore the HART chip's ability to measure each disk flux spacing during reading, and control each disk flux spacing during writing. Disk data bit rates up to 800 thousand bits per second, and totally variable density are possible!

For Atari ST and MEGA computers, 512K minimum

•

Simple plug in installation, plugs into cartridge port and external drive connector

•

Complete software included

•

Works with 1 to 4 internal or external drives

•

Discovery Cartridge is not needed to run the backup

•

Complete system for disk backup and MAC disk conversion $249.95

•

Complete system plus option #2 $319.95

HAPPY COMPUTERS
P.O. Box 1268
Morgan Hill, CA 95037
(408) 779-3830, 9-5 PACIFIC

The DISCOVERY CARTRIDGE converts Macintosh disks to and from MAGIC format, for use with the MAGIC SAC or SPECTRE 128 products. The DISCOVERY CARTRIDGE is better than 5 times faster, when compared to the Translator sold by Data Pacific. Execution of MACINTOSH programs, and access to disk data in the MAGIC format, using your Atari computer, is made possible by the MAGIC SAC and SPECTRE 128.

The Discovery Cartridge does not bog down the execution of Mac programs, like the Translator does. The Discovery Cartridge operates offline from the Magic Sac or Spectre. In just about 3 minutes, the Discovery Cartridge converts an entire disk side from Macintosh format to Magic format; read, format, write, and verify.

The Magic format disk is the most efficient and reliable format to use with your Magic Sac or Spectre. Either MFS or HFS, single or double sided disks can be converted. Once converted, no Discovery Cartridge or Translator is needed for your ST to access the Magic format disk.

OPTIONS

Option package #2 adds a battery backed up clock, ROM / EPROM sockets with a program select switch, plus the circuitry and connector needed to support direct access of a 3rd and 4th floppy drive. For added convenience, option 2 lets you plug the Mac 64K ROMS into your Discovery Cartridge, and run the Magic Sac, without the need to unplug your Discovery Cartridge and plug in your Magic Sac.

Other options, including a 2nd cartridge port, and the ability to use the Mac 128K ROMs inside with Spectre, are also available. Happy Computers does not sell the Mac ROMS or the Magic Sac or Spectre. These can be purchased separately.

The Expander from Astra -- A Hard Drive Plus a Whole Lot More

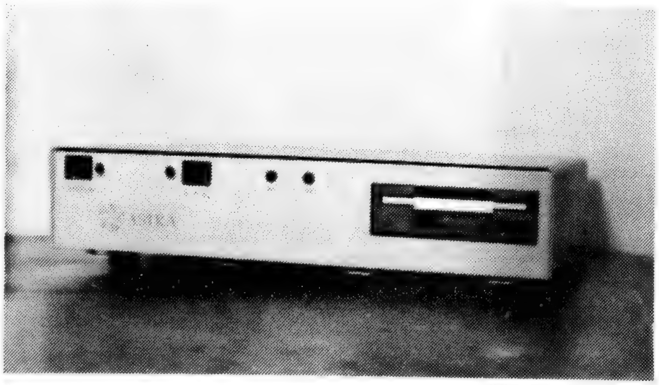
by Bill Rayl

If you are more than just a casual user of your ST, chances are you've been thinking (or dreaming) about adding a hard drive to your system. Once you've made the decision to buy a hard drive, you are faced with a multitude of possibilities. Many ST owners have been buying kits from companies like Tech Specialities or ICD and building their own drives. If you have a relatively cheap source for the actual drive mechanism, you can usually save some money using these kits.

There is at least one drive on the ST market that stands out from all the rest. The drive is the Astra Expander, and it gives you everything you need and more.

The Expander series of hard drives from Astra Systems of Santa Ana, California really lives up to their name. At a base price of $759.95 for the 20 meg, $819.95 and $999 for the 30 and 40 meg versions, the Astra drives retail for about the same price as hard drives from Atari or Supra. The difference is in what you get for your money.

There are many advantages to buying an Astra Expander over drives from the other companies. First, the Astra drives are truly expandable -- you can open the case and plug in another hard drive. In fact, the Astra system can hold up to three hard drives, for a total of 120 megs. Expansion kits are available from your local dealer or directly from Astra. The expansion kits were retailing for $479, $549 and $629 at the time of this review. These kits give you much of the flexibility that current build-it-yourself kits have. When you find yourself outgrowing your current system, the Astra drive can expand along with you.



Each Expander also comes with a built-in surge protector and four AC outlets along the back of the sleek and sturdy Mega-sized case. With this setup, you can plug your computer, disk drive, monitor and printer or modem directly into the back of the Expander. On the front of the Expander, you'll find two power buttons, one labeled "System" and the other "CPU." The CPU power button controls the power to these four AC outlets, allowing you to power your CPU and peripherals down and up independently of the hard drive. This is especially nice for Mega ST owners who would otherwise be reaching around in back of the CPU to power up or down.

An optional double-sided 3.5" disk drive can also be included inside the Expander case for an extra $125! If you are currently a one-drive owner, the Astra Expander with built-in floppy gives you an excellent and flexible system.

As for the components of the Expander, Astra has a reputation for building some of the sturdiest and best drives available. The Expander series drives are all high performance workhorses. Since the drives are the autoparking kind, the heads automatically find a safe place when you shut the power off. The drives also come with a one year warranty!

Another nice touch is the way Astra Systems tests each and every hard drive before it is shipped. Enclosed with the drives is a "checkout sheet." Every drive has to pass a number of tests before Astra lets it out the door!

The Astra Expander comes with 10 pages of documentation and software for booting and formatting the drive, as well as the latest version of George Woodside's excellent backup program, Turtle. Of course, you don't even need to format the drive if you don't want -- Astra has already done that for you as part of their testing of the system!

If you're looking for a hard drive system that offers high quality, value and flexibility, the Expander series from Astra Systems should be top on your list.

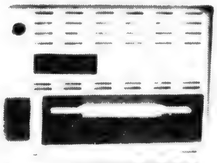
Southern California Astra Systems,
2500 S. Fairview Santa Ana, CA 92704.

Astra gives up !!!

No we are not going out of business...
We are going out for business !!!

The demise of many Atari dealers, and the reluctance of many more to carry much inventory forces us to announce:

Astra Systems goes Factory Direct !



SYSTEM HD+

Our original offering for the ST computers is now available in 20, 30, and 40 megabyte capacities. With precision double sided 3 1/2" microfloppy and its tough construction it ranks as the one to beat.

ST XFormer II: Running 8bit Software in a 16bit World

by Bob Retelle (MACE,WAUG)

If you're like a lot of Atari ST owners, you probably "upgraded" from an Atari 8bit computer system. If so, you may have favorite software you wish you could still run, but isn't available for the ST. Or perhaps you've sold your 8bit hardware, but still have important business or personal records stored on 5.25" Atari disks. If this sounds familiar, the ST Xformer II may be for you.

Originally started as a programming exercise, Darek Mihocka has constantly improved the Xformer to the point where it has become a truly useful system. Please note a version of the ST Xformer, published last year in ST-Log Magazine, is extremely out of date and doesn't come anywhere near the capabilities of the current version 2.3. Darek has uploaded more recent versions of the ST Xformer to BBSes and online services as Shareware to demonstrate most of the features. By registering your copy, you'll receive full documentation along with a disk containing the complete emulator and several related utility programs. The registered version of the emulator also utilizes a special cable Darek has designed, so you can connect 8bit Atari peripherials to your ST!

Like most software emulators, the greatest drawback of the ST Xformer is its lack of speed. Darek recognizes this challenge and is continually working to improve the system. As it stands now, with Version 2.3, the ST Xformer is running at about 40% of the speed of a normal 8bit Atari computer.

Actually, designing the 8bit Atari emulator was more difficult than emulators for other machines. The IBM, Macintosh and CP/M machines are considerably less sophisticated than the 8bit Atari. Not only did Darek have to translate the 6502 machine language of the 800 into the 68000 machine language of the ST, but he also had to duplicate all of the complex functions of the custom chips in the 8bit. The results are very good, although some of the features are not fully implemented yet.

One particularly tough problem was getting the 8bit software INTO the ST in the first place. The GEMDOS file structure was incompatible with 8bit files, so you couldn't just transfer the files onto ST disks by modem and load them into the emulator. Darek finally hit upon the idea of creating two "virtual" disk drives in the ST's memory, similar to a Ramdisk but using the disk structure of the 8bit disk drive. The entire 8bit "disk" is saved out onto the ST disk drive as one large ST file. This system works quite well, although it's a little awkward. The emulator disk includes utility programs which will take a file from an ST disk and add it to the 8bit "disk" file.

After a little creative "prodding," Darek began experimenting with connecting 8bit peripherials to the ST. The result is a cable which plugs into the SIO port on a 8bit disk drive on one end and the ST's printer port. The registered version of the ST Xformer II has the routines built into it to allow reading and writing directly from the external 8bit disk drive. This makes transferring files easy and opens up the ability to boot the emulator directly from original 8bit disks. Virtually any DOS can be used on any compatible disk drive and at any density. The only problem I ran into using the cable was some copy protected disks wouldn't boot, probably because they depend on critical timing routines.

The addition of this direct-connect cable really moves the ST Xformer II into the realm of a truly useful tool. One use I've made of this setup is to download 8-bit files into my ST, using my favorite ST terminal program, then transferring the programs onto 8bit disks directly. No more having to boot up my 40 column 8-bit terminal program, or tediously transferring files by null-modem!

The results of my testing various 8bit programs were a little mixed. Most games are just too slow, and I had trouble with the copy protection on many of the game disks. One notable exception is text adventures. Zork, and the other InfoCom games run just fine, and I imagine graphics adventures should be OK too.

Applications programs should run well for the most part. I tried several including the Atari Home Filing Manager, the Computerized Card File from APX, and my old venerable Text Wizard word processor. AtariWriter and PaperClip also work with the emulator, but I understand Synapse programs (like SynFile) may have problems. One unexpected thing I ran into was many applications seem to use Players to highlight menu choices. Unfortunately, the Player/Missile support in the emulator is not fully implemented, so it's hard sometimes to tell just what's being pointed to on a menu.

Music was a little disappointing on the emulator, although that wasn't unexpected. The ST only has three sound channels while the 8bits have four. In most cases, you lose one voice, which can make the music sound very strange.

I tried both Pokey Player and Advanced Music System on the ST Xformer just to see how they'd sound. Pokey Player surprisingly ran at full speed. It uses interrupts to time the music, so there was no slowdown. Unfortunately, it suffered from the dropouts caused by only three voices. Advanced Music System uses timing loops in software to set the tempo, and thus sounded like a 78 RPM record being played at 33 1/3 RPMs. I was able to speed the music up manually, but even at maximum tempo, it still didn't cut it.

Graphics were more successful, even though some graphics modes, and all GTIA modes are not supported at this time. I was able to run several drawing programs and to display KoalaPad pictures. I had trouble with Atari Paint which refused to boot at all, probably because of copy protection. One feature of the ST Xformer is the ability to save a "snapshot" of the 8bit screen in DEGAS format on your ST disk. Originally this was to help Darek determine why an 8bit program crashed, but it will also allow you to save DEGAS versions of your 8bit graphics pictures.

There is no facility at this time to use 8bit cartridges on the ST, but just for fun I tried loading in a binary file image of my Atari Assembler/Editor Cartridge. Surprisingly, it seemed to work, and the debugger's disassembler went merrily along disassembling itself. Apparently the emulator did a such a good job of simulating the 6502 environment that the Assembler cartridge was completely fooled into thinking it was running on a 48K 800. The VALforth programming language seemed to work normally too.

So, is the ST Xformer for you? The answer depends on what you want to do with it. If all you want to run are games, the answer is NO. If you want to run applications software, the answer is a definate MAYBE, but you have to experiment to see if the programs are compatible. If you want to work with a unique computing environment, the answer is definately YES.

The registered version of the ST Xformer II allowing use of the drive cable is available directly from Darek Mihocka, Box 2624 Station B, Kitchener, Ontario N2H 6N2 Canada. The Xformer disk is $20, and the SIO cable is an additonal $23. (Send US funds, add $2 if you need single sided disks) Version 2.3 requires 1 Meg of memory and a color monitor.

Just as I was preparing this review, Darek told me version 2.5 should be released by the time you read this. It will only require 512K, and will be faster than the current version, but will be available ONLY to registered users.

Want Color For Under $100?

Unlock the Power

VIDEOKEY

RGB to color composite converter for the Atari ST

With VideoKey, now you, too, can experience the fantastic color and sound of Atari's games and graphics on any television, big screen or composite monitor! Its design provides the highest quality color composite video and RF output possible for any Atari ST, not just those that are RF equipped. Standard RCA jacks allow for easy hook-up. Optimized for low resolution use.

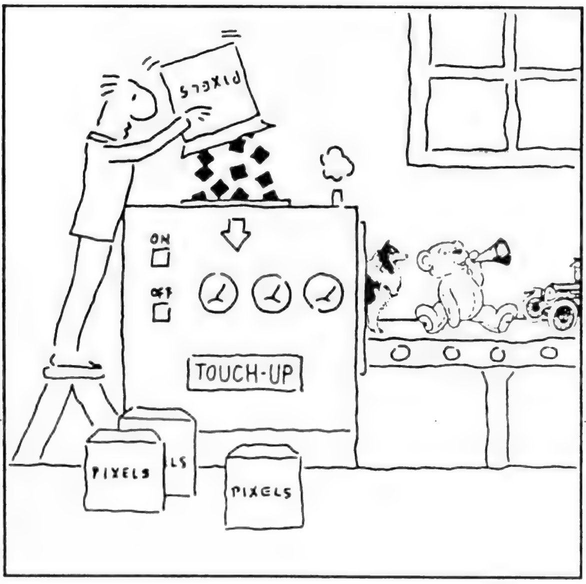
Give your desktop graphics that professional touch.

Introducing Migraph Touch·Up™



Migraph Touch-Up is the complete design tool for high-resolution monochrome images.

Create, edit, enhance—you can do it all with Touch-Up.

And do it better, because Touch-Up is the first "virtual page" graphics program for the Atari ST.* A sizeable advantage indeed!

Touch-Up can handle bit-mapped images of any size and resolution (based on available memory in your computer). Which means you can now produce pixel-perfect images for all your publishing projects.

Migraph Touch-Up. A powerful tool for professional-quality results.

Ask your dealer for a demonstration of Touch-Up, or call Migraph's toll-free number for more details.

Fight Night from Accolade

by Brian Baughman (GRASS)

with help from Dad, Chuck Baughman, GRASS

As you duck out of the way of a head blow, prepare to punch back in this neat game of boxing skill.

There are five variations of the game, which you can choose from a screen. These are:

Main Event, where you test skills against the world's toughest fighters

Boxing Construction, in which you create your own fighters and pit them against other fighters

Training, where you can practice handling you boxer on punching or speed bag or you can train against a boxer

Sparring, which is practice against another boxer for more training

Tournament, in which you are a fighter promoter pitting your stable of fighters against your opponent's boxers

A player can make his own boxers, but must use the body parts programmed into the computer's boxers. Some of these boxers are good, some are wimpy. When you play "Main Event," you must use the computer's boxers. The tournament feature is okay, but would be better if it were double elimination.

The game has good graphics and is joystick controlled. It required only about fifteen minutes to learn, including skimming the instruction book for directions.

Two human players can control their boxers against each other. I won the first tournament I was in and beat one of my friends every time we boxed.

Dad says... the kids seemed to have fun with the game. I will be interested to see how long this continues, as you can get to the point where you always win.

New Improved Version

TURBO ST

By

SofTrek

P.O. Box 5257
Winter Park, Florida 32793
(407) 657-4611

— FASTER THAN A SPEEDING BLITTER !!

- Makes your 520 / 1040 ST™ outrun a Mega ST™.
- New version supports HiRes 40 and 50 line modes.
- Makes *ALL* versions of TOS run faster.
- Only $49.95 — Less than half the cost of a hardware blitter.
- Installs automatically — just load it and forget it.
- No soldering, no copy protection, no setup — Just speed.

Turbo ST vs The Blitter (% speed increase)

	Monochrome		Color	
	Blitter	Turbo ST	Blitter	Turbo ST

Word Writer 2.0	34	31	35	37

Results obtained while paging through an appropriate data file.

Ask for Turbo ST at your local dealer or send $49.95 plus $2.00 shipping and handling to SofTrek, P.O. Box 5257, Winter Park, FL 32793. Florida residents add 6% sales tax. Visa and MasterCard phone orders accepted. Call (407) 657-4611. Upgrades to version 1.4 are available for $5.00 U.S. plus your original disk. Offer expires 60 days from the date of this publication.

Turbo ST does not speed up programs that use GDOS fonts or that bypass the GEM operating system, such as PC Ditto, but is compatible with them. TOS, ST BASIC, ST Writer, 520 ST, 1040 ST, and Mega ST are trademarks or registered trademarks of Atari Corp.

Get In The Fast Lane — Buy Turbo ST Today!

ASTI Talks about...New Users and Old Software

by ASTI (GLASS)

Haven't had your machine for long, you say? And you're asking where you can find out which software has proven itself worthy of your hard earned dollars. Of course, we all know that first I would be inclined to point you to your nearest user group for support. But I will also include some of my thoughts and experiences here, with the software I and the Dictator cut our keys on. This isn't to say that what we use is the best, or best suited for you, but we are happy with it.

Word Processing

We use First Word for the light stuff. This was a WYSIWYG (what you see is what you get) word processor that came in our original package a couple years ago. The big sister of First Word is First Word Plus. It comes with a built-in spelling checker which is very handy.

For the more professional writing jobs we use Word Perfect. This is when we need a program that can handle Indexing, Paragraph Indenting, Automatic Hyphenation, Mail Merge, Footnotes, Endnotes, and other options, too many to list. Word Perfect is not as easy to learn because it is more powerful, but if you need the power it's there and the program is very professional. I am very pleased with it.

Spreadsheets

Spreadsheeting is done very handily with VIP from ISD of Canada. For the $129 list price, this is a very powerful spreadsheet, very similar to Lotus 1-2-3. After using Lotus at work, I was very pleased to find that VIP sheets could run on Lotus with very minor changes. VIP comes in both a text and GEM version. The TEXT version is good for the "power" user who likes to keep hands on the keyboard (no mouse usage) and wants the largest and fastest spreadsheet available. The GEM version is very friendly, with the mouse selection of menu items for large field definitions. I started with the GEM version but soon found myself going to the TEXT version because even that was easy to use.

DataBases

Well, I didn't need much power here so after starting out with DbMaster One (this also came with my machine), I found myself buying Base Two. Base Two ($49.95) is a non-relational data manager (meaning you can have only one data file open at a time) that I found very simple to use but having enough capabilities that it's use is limited only by your imagination.

I even have a file listing all of my friends and family and use it to report on everything from my Christmas mailing list to reports on Anniversaries and Birthdays. I use Base Two like a very complex Rolodex. Having all that data and being able to sort and search for certain information or types of information gives me a very powerful feeling.

Don't forget to support the author of your favorite Shareware by sending them a Thank You letter with a donation.

Games

Ah-hah, I knew you were waiting for this one! Well, I'm going to mention the games that I play the most and that have lasted the longest on the "come-back-to'em" list. Some are public domain and some are commercial. I've tried many and liked a lot, but these are the ones that are still with me.

Cards from Michtron. Even my kids are hooked on this one. It contains 5 different card games, including Black Jack, Cribbage, Klondike, Solitaire, and Poker Squares. Give Cards a solid 10!

Next is Megaroids (soon to come to the GLASS pd library). I've long been a fan of Asteroids, one of the original arcade games, and this program outshines the original Asteroid game because of the colors and details seen in the asteroids and attacking saucers. Megaroids is a public domain game that was made by MegaMax Inc. to promote their MegaMax C compiler (a programming language), in which Megaroids was written.

Another public domain program which I can't seem to wear out is Daleks. In this simple but fun program. You are a little computer person surrounded by robots who are trying to destroy you. Your only hope is to move around the room in a way as to make the dumb robots collide with each other, leaving a pile of junk that other robots can run into and also be destroyed

You have two tools to help you. The first is called a Sonic Screwdriver which, when used, will vaporize all robots immediately next to you. Too bad you can use this tool only once on each level of play!

You also have a teleporter to zap you to somewhere else on the board, unfortunately it might be right into the hands of the enemy, as you have no control as to where you will be zapped to.

Finally, there is Celest, also known as Celestial Caesars. There can be up to four players, but I prefer to go against just the computer. Here you start out as a troopproducing planet attempting to explore the rest of the checker board like galaxy. Some of the squares you will send your troops to will have enemy planets (also producing troops) that you have to defeat. Once defeated you get the production from that planet to add to your expanding empire. You select to play ten to twenty five rounds in which to explore and conquer.

This is a good strategy game, even if the program does lose some of your troops occasionally. This game is played entirely with the mouse and your hit percentage, as well as your opponents, is shown before battle giving you a chance to retreat with minimal loss. You score points for lands discovered, planets controlled, and troops owned. Just like Caesar of ancient Rome.

Utilities

One last area of programs that can't be ignored are the Utilities, which I call Tools and keep in a folder called TOOLBOX. Utilities are used for many purposes like formatting disks, copying disks, checking memory, checking drive speed, checking for computer viruses, making Ram Disks, recovering accidentally deleted files, making Print Spoolers, and more. I'll only mention a few of them here, get information on their uses at your local user group.

Undelete (soon to be in the GLASS public domain library) is a public domain program that allows you to recover files that you deleted accidentally. VKiller, a computer virus detector and destroyer. ArcShell and Arc.Ttp, a pair of programs used together to combine and compact several files for archiving.

Of course, where would we be without our accessories? The favorite, that I almost always use are SI-Ram, is a combined removable print spooler and ramdisk.

Needless to say there are many, many more programs and accessories but there isn't room here to mention all of them. If you have any questions regarding the use of ones mentioned here, or any others that you have, please write and ask about them. If there are any that you are especially happy with, let me know about them.

Don't forget to support the author of your favorite shareware by sending them a Thank You letter with a donation, that's a good way to help make sure good shareware keeps coming! Please write,

Gridiron, the Football Simulator

Gridiron is for the Atari 520, 1040 or Mega ST computers.

Review by Edward Wehrenberg

Fellow football fans, Bethesda Softworks has come up with a program for those of us who can't quite get enough of the pigskin on television.

Gridiron, the Football Simulator, puts you not only in the coaches box, but on the field as well.

Not to be confused with a casual, time-spending affair, Gridiron is strictly for the true Atari gamer, who is willing to put in the time to learn and apply the necessary skills.

The one or two-player game is not copy protected, however, it uses a novel approach to anti-piracy.

Instead of the now-familiar, "Please type in the first word in the second paragraph on page 22," it has six pages of three-character codes, distinguished by rows and columns. The player is asked to divulge a certain page, column, and row's code to boot the game.

With more than 2,520 different possibilities, it is an effective means. The coded pages are printed on red backing, which helps discourage photocopying.

After choosing the options at startup (number of players, level, etc.), the view of the field is shown. It is from directly above, with the players depicted by colored dots. Each team has the regulation eleven-man squad, no six-man teams here! Each individual player is rated on both speed and strength. For instance, linemen are slow, but extremely strong, whereas a wide receiver would be exactly the opposite. This feature greatly enhances the realism of the game.

Included in the package is two play cards, which depict the 20 offensive and 20 defensive plays a player has at his or her disposal. As if they weren't enough, a very comprehensive play construction feature is also included. Players can save their own personal playbooks as well.

Play selection is accomplished with the mouse, as is all control of the offense. Offensively, the key is practice, practice, practice. At the beginning level, the defense will not cross the line of scrimmage which is ideal to learn to pass and hand-off.

Ironically, the most difficult aspect of the game is probably handing off without running directly into the running back and slowing his momentum. Once this is learned, you're ready for the higher levels. By the way, any scored touchdown results in a nice animation display of a player spiking the ball in the end zone, complete with a "Hi Mom," sign.

Defensively, the play is also controlled by the mouse in a one-player game, and the joystick in a two-level contest. In addition to calling the plays, you have the option of controlling any individual defender.

The two-player option is great fun. Players have the option of adjusting their team's individual player's talents to make up for discrepancies in skill.

All kicking functions are handled smoothly and realistically as well.

The game really doesn't skip a beat from a football standpoint. Fumbles, spikes, penalties, it's all there.

As with most games, the entertainment of the game is much more apparent once a decent skill level is attained. For beginners, there is frustration and disappointment. That is, until you complete that 67-yard screen pass during a linebacker blitz. The thrill will definitely keep you coming back for more.

The pro level, which originally seems lightening fast and unbeatable, will, after a number of games, probably seem lightening fast and unbeatable. The pro level is probably a match for any Gridiron junkie.

The graphics, while completely adequate and acceptable, I believe, still could have been better. Little men would have made the game that much more realistic, but the dots work okay. And they do provide a very realistic sense of motion and inertia principles.

Overall, the game is an excellent value which should provide hours of frenetic football action to serious joystick jocks.

Gridiron, the Football Simulator is from Bethesda Softworks, 9208 Burning Tree Road, Bethesda, Maryland, 20817.

ATARI

Cascades Atari Computer Enthusiasts
CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Bob Kingsbury	789-7533
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	
Editor	Jim Boyce	522-4074

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Atari Interface Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

Fishin' Around by Brent Fisher

It's up. It's finally up. Well, ok. I know that I said the board would be up when you read my column last month, and I didn't lie about it, it was up. But this month I can say with certainty the CACE BBS is up and running. The phone number is (517) 787-4011. By the way if you call, make sure you leave a message that you are an Atari computer user. We don't require voice contact with a person so all you have to do is wait a day for the sysop to up your level and you can access the board. Right now we are experimenting with putting Zmag on the board, so you happen to like it you can download it off on your first signon.

There has been some talk of getting some STs together at the monthly meeting, and having another session of MIDI maze. So if any of you out there, reading this has some interest give us a call on the board, or at one the numbers listed above and we'll give you more details.

According to some of the magazines, the new Atari DOS, DOS XE, not A-DOS as originally announced, is finally shipping. The only problem is Atari seems to have forgotten several XF551 owners have sent in their warranty cards. Atari is charging about $10 for the disk and manual. I think that anyone who has sent in their cards ought to receive a copy of DOS and manual and not be charged an exorbitant fee to use the features of their disk drive. More will be typed on this as it develops. I plan on asking Atari why this miscarriage of justice is taking place.

The next meeting will be held on February 12.

Treasurer's Report by Craig Schaff

The CACE BBS is up and running!!! We are using equipment that belongs to the club, Brent Fisher, Harold LaRue, and myself. The main program was supplied by Mr.LaRue, and the Board can be reached at 787-4011. With exception of the monthly phone bill, the Bulletin Board isn't going to be an expense to the club... BUT, we do expect to gain a few new members from the exposure of the club on the BBS. We are in need of more disk drives!!! If you have an old one (810,1050 or anything else) sitting around collecting dust, let us know, we can work something out. Also if you own or know of someone with a power supply for a 800XL, let me know because I'm in dire need of one for my system!!!

The club is holding its own in the world of big finance. We are staying about the same with dues coming in, verses the expenses of the newsletter and other items. I'd like to welcome all of the new club members to the CACE club. The list of new members is being compiled as you read this, and will be printed in next month's issue.

If you need any info on renewing your membership, you can give me a call at 787-3970. Dues are $14.80 a year and you get a subscription to Atari Interface Magazine. If you like, you can still renew at $10.00 and not receive the subscription of AIM. The Atari Interface Magazine was formerly known as Michigan Atari Magazine (MAM). Your club has the lowest subscription rate around for this fine publication of AIM. We will except memberships via mail from any part of the country.

One last thing... Does anybody have a disk copier program that will completely copy an enhanced 1050 type disk??? That's all for this month... see ya later

Ask Tim by Tim Sharpe

Q I am an ATARI 1040ST owner who works in the Pentagon in the purchasing department. Can you recommend a good spread sheet program for the ST?

A Surprisingly enough, there is a spread sheet program that is tailor-made to fit your needs. It is called "Big Government Spread sheet" and is published by Kickback Software. BGS has many useful features, one of which is the multiplier option. You can designate the price of certain purchased items to automatically be multiplied anywhere from 10 to 100 times their actual value. Some items, such as hammers, have a minimum price value of $500 each. Anything less than the minimum price value generates a warning for the user.

You can also choose to have the totals on the spread sheet add up to less than they should, to facilitate embezzlement. And although I can't tell you more about the program (without a bribe), I can tell you that it is an absolute bargain compared to other spread sheet programs. The cost of the program is about $10,000.

Q I am left-handed, and it makes me furious that most 5 1/4 inch floppy diskettes have write-protect notches on the right side only. This makes it very difficult to stick those nasty, gummy write-protect tabs on the diskette. Do you think there is a conspiracy involved in this?

A Speaking as a right-handed person, I would just like to say that there are two ways to do things in this world: the RIGHT way or the wrong way. Hence the appearance of the right-protect tab on the write side (or vice-versa).

CAPITOL HILL
ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. The meetings take place at the MSU Physics-Astronomy Building, Physics Road, Room 118. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them. To get to a meeting, take East Grand River to the Collingwood Entrance for MSU. The first available left turn is Physics Rd. The Physics-Astronomy Building is about 1 block from the corner, on the right hand side. Park in the gated lot just past the building.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

Elected and appointed Officers of CHAOS

President	Leo Sell	349-0404
Vice President	Guy Hurt	484-7675
Sec'y-Treasurer	Gary Ferris	393-2593

Gen. Pub. Librarian	I. Pothacamury	332-0558
ST Pub. Librarian	Chet Kapusinski	676-4539
XE SIG Coordinator	Guy Hurt	484-7675
ST SIG Coordinator	NEEDED!!!!!	
BBS Sysop	John Nagy	487-5646

President's Corner by Leo Sell

February...halfway through winter. There has been scarcely any snow so far here in Lansing, unless you count the snow from Sunnyvale. I still have a long way to go before I know my way around my ST very well. It's something to do on these cold winter nights -- that is, IF I can wrestle the mouse away from my kids.

Next month is election month. The elections take place March 15th and will replace most of the ST SIG meeting. This is a GENERAL MEETING of CHAOS and it's important that you be there to register your vote. All officers, including the ST and the 8bit at-large members, will be elected. If you cannot be there, but would like your name placed in nomination, let me know.

There will be NO 8Bit meeting in March, due to policy enforcement at the Physics-Astronomy building. As per their policy, we may now meet there only if the building is open to the public. The building will be closed that Saturday. It will also be closed in the summer. Which means we need a NEW meeting place. If you know of some place we can have our meetings, please let me know. We must move by summer. If possible we need a place that is FREE of charge and that we can have on a permanent, year-round basis. Please check with your church, synagogue, lodge, employer, or the like, and let me know if there is something available.

Ran into some excellent customer support recently. I bought ProCopy, with the assurance that it was the newest version. Unfortunately it wasn't. But the documentation said that if I sent my registration and $1.50 for the price of a disk, Proco would send me the most up-to-date version of the program. I mailed the card and check on Monday, and received the new disk by Friday. Outstanding!!!.

Here are a few deals I've read about. Thought I'd pass them on to you so you can take advantage of them too.

E. Arthur Brown (800-322-4405) MAY still have Page Stream Jr available for $29.95.

Michtron is offering the following deals for a limited time:

* HiSoft BASIC for $39.97, or Power BASIC for $79.97. Send a photocopy of the copyright page of your current version of BASIC, the amount indicated, and $5.00 postage and handling.

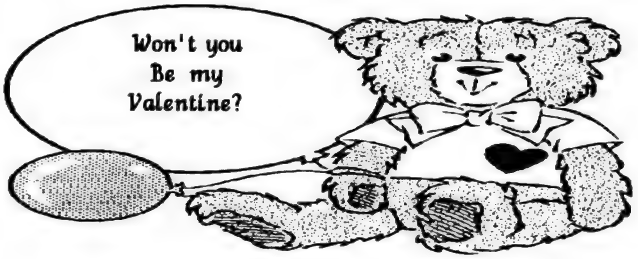
* Fleet Street Publisher - a well thought of desktop publishing package - for $50.00. Same provisos as above, with a photocopy of your present DTP package copyright page.

Both of these offers are exceptional. The BASICs are half price, while Fleet Street retails at $149.95. I've already sent for mine, both to take advantage of a great deal, AND to support Michtron. The address is Michtron, 576 S Telegraph, Pontiac, MI 48053

Speaking of supporting Michtron, I'd like to encourage all ST owners that are programming in BASIC, or plan to, to buy the new HiSoft BASIC from Michtron. Considering the excellent, long-time support Michtron has given ST owners, and the shabby treatment they received from GFA, I'd like to see HiSoft replace GFA as the defacto standard used. That's a big reason I'm buying it. Frankly, I don't program as much as I'd like, but when I do...

Once again, I'd like to beat the drum for volunteers. The disk library needs a great deal of updating and needs some willing and talented people to help out. And, any newsletter efforts we make need many hands to help. Give me a call and I'll be happy to tell you how you can help out.

Happy computing.



GENESEE ATARI GROUP

Serving the Flint area

President's Report by Jerry Cross

Because of recent changes in our affiliation with Atari Interface Magazine (formerly Michigan Atari Magazine), and the possibility of our club subscribing to a new newsletter called Zmag International, it may be necessary for our club to change the way our membership dues are figured. I am sure a number of you would like to continue to receive AIM, and from what I have learned from Zmag publishers, I am equally certain you will want to subscribe to Zmag also.

Since Current membership dues would not cover both of these subscriptions I am asking for your advice on how to procede. Another Michigan club is currently offering a system where a "base" membership would be paid, and you would then pay an additional amount if you would like to receive one (or both) of these magazines. By subscribing through GAG, you would benefit by getting a discount off the regular subscription price. Another benefit would come from GAG members who are also members of other clubs that also receive either Zmag or AIM. Some of our members are getting more than one AIM already, so this type of membership setup would help them also. Please think about this, and we can discuss the details at the next meeting. I also should have more details about the future of AIM, since another meeting has been scheduled for the first weekend of February.

Catalog updates are now being prepared and will be mailed within the next few weeks (you may even have them by now). After looking at the size of our catalog, I think it would be cheaper for our club to send out only the updated pages. If you would like to receive the whole catalog (over 50 pages!) we will send you one.

Finally, I would like to ask you to consider demonstrating one of your new Christmas toys at a future GAG meeting. The meetings have been getting sort of boring, and I would really like to do something to add some exitement and interest. Let me know if you are interested.

That's it for this month, see you at the next meeting.

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal Computers. This organization is not affiliated with Atari, Inc. GAG meets on the second Wednesday of the month at the Neithercut School, located at 2818 Crestbrook Drive, Flint. Meetings begin at 6:30 pm. Membership in GAG includes a subscription to AIM and access to our large library of PD software, Hardware, and Magazines. Membership:$15

GREATER KALAMAZOO ATARI USERS GROUP

GKAUG

GKAUG meets on the second Saturday of each month at 11 am in the Dewing Hall, Room 305, on the Kalamazoo College Campus, Corner of Academy and Monroe. Dues are $25/yr and include a subscription to Atari Interface Magazine.

President	Frank Fellheimer	657-6106
Vice President	Dan Youngs	
Treasurer	Dave Bryant	
Librarian	Dale Vincent	
Archiver	Dave Oldenburg	
SysOp	Alex Stevens	
GKAUG BBS		(616) 657-2665

Minutes of January GKAUG Meeting

We had only eight members show at the January 14, 1988 meeting. This was suppose to be the meeting for elections, but due to the poor turnout, we may be distributing some of the duties between the current officers. Frank Fellheimer will be President, Dan Youngs is our Vice President, Dale Vincent as Librarian, Dave Oldenburg is Club Archiver, and Alex Stevens is the Club's BBS SysOp.

Our Librarian reported that we have about six 5-1/4" disk with ST programs that needed to be ported to 3-1/2" disk. We also discussed whether we should offer for sale, any of the duplicate magazines in the library. Also we are going to make a disk purchase of about 100 5-1/4" disk and would like to know if any member would like to buy any at this bulk rate.

One of the members told us about how he connected a 65 meg hard drive to his ST computer. The drive is partitioned into 16 meg sections or as five seperate drives. He still must boot from a floppy disk first, and would like to know if it is possible to boot from the hard drive. If anyone has any information, leave a message on the club BBS.

We got a chance to see how an IBM laptop computer works from Dan Youngs. With the price range of IBM compatibles dropping, it may be a serious consideration for upgrading to some of our 8bit users.

We then demoed the SUPER-ARC/UNARC program, Version 2.0, by Bob Puff. This is two programs, one to ARC and one to UNARC. It is written in 6502 machine code and is not just a ported over version of the popular ARC programs for the IBMs. This makes it run very fast. It has some good features such as being able to view the seperate files in an archive set. Being able to add a file to an already existing archive set. Delete file and directory functions from within the program. It has a very nice menu to choose all functions from.

Remember to look at your expiration date on your magazine label. It is a good reminder that it's time to renew. This is especially important, as seven of our members need to renew this month!

David Bryant (Former Treasurer)

From The Desk Of The President...January 16, 1989

Why do I like the GLASS user group so much and what am I going to do to try to make it better? Two and a half years ago, I needed a user group to help me learn how to use and understand my computer. Like many of you, I bought several pieces software that not only would not do what I needed it to, but it didn't even work very well. I had a printer which I didn't understand, and a computer that didn't understand the printer either. I was new this area and didn't know where good computer stores where. And I found that I needed to upgrade my machine but didn't know how to go about it. The clubs I did find were still wallowing in 8bit Ataris and hadn't yet, or couldn't effectively, integrate this fine new 16bit machine into their club.

Now there's GLASS, an Atari ST only group, that spends all of its energy in attempting to stay up-to-date with all of the new things that surround this machine and help the users learn how to utilize as much of the power that sets before them as possible. The club is home for every level of user from beginner to hardware and software developer and all levels in between. We explore every area from business to music, to even (yes, Mike G.) games. We used our dues to buy the club three computers so we would not have to haul our own machines to the meetings. We purchased software and subscriptions to give away in free drawings to attending members. We put on seminars for ourselves and guests. We even had an open-house where we played Midi-Maze and gave away prizes to winners. (Prizes donated by local, friendly stores..Thanks guys!)

But now I am entering into my second official year as president and wish to share with you my hopes and dreams for helping the club to grow and improve, without loosing its special family-like feeling. First, I vow to improve the assistance to the newer members. It's hard for a newcomer to come into a room full of people absorbed in computers and feel comfortable enough to ask questions without the fear of looking dumb. One of the club's computers will be set up in a Newer Members area. Here, the beginner can learn about ramdisks, print spoolers, get answers to questions about hardware and software, and pick up some of the "Tips & Tricks" that so many of us take for granted.

Secondly, there expects to be one or more Atari computer shows in the Detroit metro area this year. I think many of us would enjoy attending and hope that we can do so by having and supporting a GLASS booth at the shows to promote our group and computer. Some of us may even be willing to be volunteers of the show and provide assistance to vendors. Watch for further bulletins on shows and requests for help.

Finally, we would like to see your personal participation in demonstrating some of your favorite software (10-15 minute sessions) and/or helping lead in some of the second half tutorial sessions. Atleast, let us know what particular piece of software you would like to see training in. In closing, I encourage you to help the newer and/or less-knowledgeable members feel at home with us by introducing yourself and sharing your computing experiences. Thanks for 1988 and here's to 1989!

Meeting: Wednesday, 1 March 1989. Wyoming Public Library, 3350 Michael S.W.. Time: 6:30 P.M.

Tim Feenstra	President	(616)784-6230
5625 Buthview N.E. Comstock Park, Mi. 49321		
Greg Williams	Vice President	(616)698-7319
George Nosky	Treasurer	(616)942-1527
Bob Bulliment	Secretary	(616)459-8351
Chuck Baughman	Librarian	(616)795-7373

President's Monthly: 11 January 1989

The holidays are over, and it is time to plan the upcoming year. As of this writing, I do not have the financial report yet, but I can let you know what discussions with the other officers have produced. First, the Atari fair should be well into the "getting ready" stage by now. Hopefully Jerry Borysiak will have secured a date at one of the malls that were discussed at earlier meetings. I am looking forward to a bigger and better fair, one that will let those Atari owners who have not found us yet that we are there for them to join.

We have also decided to stress useful and productive products for the monthly demos and raffles. The overwhelming response to the SpartaDos demo, expertly done by Greg Williams, has proved that we want more then just games for our trusty 8bits. By now you should also know that I have contacted ICD about a group purchase of the SpartaDos Construction Set. I would like to thank the folks at ICD. They were friendly and receptive, something that a lot of large orginizations loose on the way to the top. They also put out some of the best products for the 8bit Atari, so we should all try to support them in every way that we can.

The Basic Programing Conferences will continue. Who knows what our little calculater program will be able to do in a few months. For those who are not GRASS members, we have a little Calculator program that will continue to grow and expand as new programing commands are discussed and used.

As the Basic Programing continues, I'm planning a programing contest, and I hope all GRASS members participate. I'll try to make the prize worth the effort. You never know what you can do until you try.

Coming demos include a call to a local bullitin board, via the VCR. The tape with the Genie demo on it has a lot of room left for more telecommunication exploration. With that demo there will be an Atari 1030 modem up for the raffle. You won't want to miss that one if you do not already have a modem.

All in all I am looking forward to an exciting, fun, and informative year. If you know of a hardware or software item that you would like to see demoed, just let me know, and I'll see what can be arranged.

One last item. It is that time of year again, the new officers take charge, and all members pay their dues. George Nosky has said that he will get the notices out to all the current members next month. Please join again and let's all enjoy this new year togather. Come to the March meeting

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

Minutes of January General Meeting

The first general meeting in '89 was called to order at 8pm by Meeting Coordinator Bob Retelle, who started the show with what was probably the shortest "Atari News" discussion to date. The biggest news is the rumored impending sale of the Federated chain store, which should please most of the stock holders and Atari users around the world. President Bill Rayl announced he'd received the "new and improved" Page Stream just prior to leaving for this meeting. This proclaimed "bug-free version" came at a time when MACE was expecting a visit from a guest speaker from Soft Logic, so we'll be looking forward to a demo in the future. (We just don't know who's going to do it yet...!) Additional news included discussion of new software from Migraph, and more info about the new policy changes at PC Pursuit.

Bill read a news clip (Reuter's) that described a pending deal between AT&T and Nintendo. Seems Atari missed the boat again, as AT&T has been on the prowl recently looking for a company to jointly sponsor a national "games network." Nintendo purportedly will supply the gaming devices, while AT&T supplies the link to allow gamers to play against other gamers across the country. Seems the only thing standing in the way of immediate development is the standardization of connectors.

Member Chuck Masek gave a description of his newly acquired Tweety Board (Practical Solutions), including how he installed it. Chuck was highly complimentary of this product, and noted that it is getting rave reviews across Atariland.

Pattie Rayl lead a discussion of her efforts to negotiate a possible MACE/Atari-sponsored convention in May. It seems, once again, Atari is hedging on its verbal agreements to commit to any written agreement to guarantee advance funding or losses incurred by the group if the show fails. Many members expressed serious concerns that "We'll be there" may sound good on the phone, but it's invisible ink when it comes to getting anyone at Atari to sign a formal agreement. The most notable comment: "There should be absolutely no forward motion until a check is received from Atari." Mention of the possibility of another show in this area (sponsored by ST World magazine) at around the same date inspired one member to ask "When push comes to shove and Atari can't attend BOTH shows, who will they be loyal to?" A LONG discussion ensued, and many comments amongst the members were decidedly negative. When a vote was held to determine the club's official stance on pursuit of the show, 21 persons voted to continue while 11 persons voted to drop the issue. The lack of participation/interest on the part of the members is a serious concern to many of the club officers, as the success of this show could well hinge upon the willingness of the members to help. As per the Constitution, a vote was held to elect a Convention Manager whose duty it will be to form a committee (officially the "Convention Sig") which will "be responsible for coordinating all activities necessary for the planning and holding of a MACE sponsored convention." Pattie Rayl and Mike Olin both received nominations for the position, which Mike declined. Pattie did not receive any "NO" votes and now holds the position until A) 60 days following the completion of the convention, or B) 60 days following MACE's withdrawal of convention support.

Following a brief intermission, the 8bit Sig was treated to a demonstration of Antic's "Personal Finance and Education" software (which includes "The Personal Bookkeeper," "Life In-

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

DigiSound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape. **$149.95**

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. ● The first and only full color digitizer for the ST. ● Uses standard video inputs like video camera, VCR, or video disk. ● Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. ● Pictures can be used with Degas, Neochrome, Powerprint and others. ● Automatic calibration of contrast, brightness and white balance. ● Plugs into cartridge port for easy set-up. ● Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST **BLOW YOURSELF UP**

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!** **Only $39.95**

Polydisk

Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only $39.95

Polydisk Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

TOTAL CONTROL SYSTEMS

GOE™

GRAPHIC OPERATING ENVIRONMENT

TOTAL CONTROL SYSTEMS is proud to announce the arrival of the very latest in 8 bit software, a true GRAPHIC OPERATING ENVIRONMENT.

Don't be fooled by cheap imitations! Don't be misled by advertised promises! It's time for your 8 bit to get up and GOE!

GOE is a complete desktop interface for the Atari 8 bit which ties up only 8k of memory for a 64k program - using the GOE cartridge! GOE supports icons, drop down/pop up menus, resizable/slidable/movable windows, control panel/calculator/notepad desk accessories, numerous mouse controllers, various font styles/sizes, and uses Atari help/console keys.......all this and externally programmable, too!

GOE doesn't stop there! GOE supports redefinable disk/file icons, comment storage for each disk/each file, time/date stamping, directory sorting, and........all popular DOS's including SpartaDOS II/X, Atari DOS II, and the new Atari DOS XE.

GOE includes complete programming information and a disk with Atari BASIC, Action! and Mac65 examples.

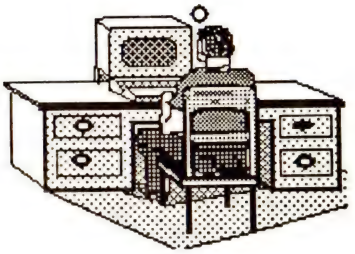
AIM is produced on a 520ST with 2.5 megs, HP LaserJet II, Timeworks' Publisher ST and PageStream

Atari Interface Magazine is a monthly magazine that also serves as the official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicom Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. A subscription to AIM is included in membership in any participating club or may be purchased directly from Unicorn Publications. For advertising or user group discount subscription rates, please call (313) 973-8825.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable). Opinions expressed within articles in AIM are solely the views and responsibility of the authors and do not necessarily represent the opinions of AIM or of any participating group. Atari, the Fuji symbol and names of various Atari computer products are trademarks of Atari Corp.



Editorial Ramblings

It's March, and from the way Dealers in the Michigan area are talking, Atari will have nothing to fear from the Ides. All the dealers we've spoken with are very upbeat about selling Atari Computers; they're well-stocked, with ample supplies waiting when they sell what they already have. Ads have been seen across the nation, and the hope is Atari will fullfill its promises for the Second Quarter '89!

This Spring and Summer should be good for the Atari Users in Michigan with two Atari shows in the works. MACE and Atari Corp. are sponsoring the Michigan Atari Computer Expo on May 6&7, and ST World Magazine is planning the World Of Atari series of shows, one to be held in Dearborn on June 24 & 25.

If your club hasn't been represented lately by an article in AIM, perhaps you'd like to write one! Remember, it's your contributions which help keep this a high-quality, User-oriented publication.

Bill & Pattie Rayl

ProCopy ST BACKUP UTILITY

You can't backup your software because copy protection locks you out. **ProCopy** is the key!

- Protects against the accidental loss of expensive software
- Works with all Atari STs
- Copies both S/S & D/S disks
- Use with 1 or 2 disk drives
- Not copy protected
- **FREE** shipping and handling
- **TOLL-FREE** telephone number
- Updates are only $12 with return
- Orders shipped same day
- Disk analyze function included

From the Reader's Viewpoint

Clubs and AIM

Dear Editor,

I just read the January issue of AIM. I've been intrigued by the conflict between the Atari clubs and AIM, the magazine they helped create.

I feel the conflict is over the "Personality" of the magazine. Over the last year or so, I've noticed AIM's personality has changed as the magazine has physically grown and changed. I'd rather see AIM have the personality of the old MAM, because I feel the old MAM more accurately reflected the personality of the club I belong to, WAUG.

I believe it's this change in personality which is scaring some people. They (and I) were hoping MAM's personality would freeze in just the form they enjoyed. I later realized this was a selfish viewpoint. Everyone has their own theory of how to create a perfect world (and not a one is correct).

AIM is independent. It will develop its own personality just like a growing child. I'm sure any personality conflicts which arise between AIM and the clubs or readers will correct themselves. The clubs and readers will continue to complain to AIM.

AIM will likely review all reasonable complaints, then make changes. Remember, without readers to subscribe or clubs to participate, AIM can not exist. They have to keep us happy.

For those not satisfied with AIM, I propose a disclaimer. It could appear on page 2 in AIM with the other disclaimers or at the beginning of any entry submitted by a club not satisfied with AIM:

"The Personality of AIM does not necessarily represent or reflect the Personality of (any/this) club. (The clubs/This club) participate(s) in AIM solely to bring a healthy exchange of information within the Atari community."

A few compliments:

A "Good Job" goes to Jerry Cross for his articles on call blocking. I was entirely unaware of the problem.

Another "Good Job" goes to Tim Sharpe for his funny questions & answers. I'm sure he hasn't received any response for his creative efforts.

Jay Skotcher,
WAUG

A Fix for a Disk Change "Bug"

Dear Editor,

Some time ago, Atari shipped quite a few disk drives with a "bug" which made the system not recognize a disk change.

I understand that such drives can be exchanged. If, however, you don't want to do that, or if you've upgraded a single-sided drive to a double-sided one and found that you were "lucky" enough to get a double-sided mechanism with this problem, here's a fix:

Article 11478 of 11544, Tue 19:09.
Subject: Re: Attaching a CHINON drive to the ST (the saga continues...)

To get the drive to acknowledge a media change, run a jumper from pin 2 to pin 28 on the drive's 34 pin connector. As you look at the mech from the REAR, pin 2 is the top left pin, 28 is the 4th pin from the right.

Atari's drives combine media change (pin 2) and write protect (pin 28) into one pin. This is why you can't get a media change without this jumper.

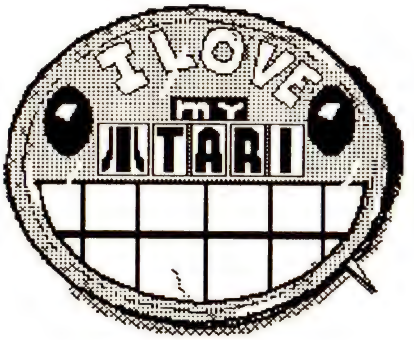
However, be sure and try to write to the disk after you do this. If the computer gives a constant "Disk write protected" warning, then disconnect the jumper. I have this problem. My Teac mechanism doesn't have a strong enough write protect signal to make it with the two wires connected. However, I doubt you will have this problem.

Chris Freemesser Rochester Institute of Technology Bis spaeter!

I've performed this modification on the Tandy drive I bought a few months ago, and it works fine.

That Tandy drive has a Teac mechanism, so the problem mentioned in the posting doesn't necessarily apply to all Teac drives.

Rod Smith,
WAUG



Atari News and Comment

by Bill and Pattie Rayl

It seems that March, the herald of spring, may be heralding the beginning of a new season for Atari in the US. The promises made by President Sam Tramiel for the new year are definitely coming true, and '89 may be "The Year of Atari."

Reports in the past few months have indicated Atari was purchasing twice the amount of parts and stepping up production. We are about to see the results, as Atari begins its US push. Atari has reportedly set aside a large chunk of money for a National advertising campaign. Michael Pender of Moody Blues fame narrates three of these ads, one for DeskTop Publishing, one for MIDI and one centering on the 1040ST compared to other machines. The national ads being produced by Atari have "trailers" for local dealers to add their names and information.

Unlike the past rumors of national ad campaigns, these have reportedly been seen in a number of regions in the US.

Atari has also lowered the price of the 104ST to $799 for monochrome and $999 for color systems. With the highly competitive pricing and national advertising exposure of the 1040ST, Atari is strategically positioning itself for a major US push that has ALREADY begun.

Our favorite computer producer has also reportedly opened an R&D facility in Chicago, IL and has taken steps to get a dormant chip manufacturing plant in Santa Clara, CA into high gear.

Atari Trade-Ins

In another push to sell more STs, Atari is instituting a deal allowing 8bit Atari owners to trade in their working or non-working machines for a $150 discount coupon good toward the purchase of an ST! Registered Atari User Groups and dealers should have all the details by the time you read this.

For those still not ready to part with their 8bits, it seems Atari has run out of stock on older modem disk drives and modems. Owners who have been sending in non-working 810s and 1050s, along with $75, have been receiving XF551 double-sided drives as replacements. Old 1030 or XM301 modems sent in with $40 are being replaced by Atari's 1200 baud SX212 modem. Maybe it's time you retired that old hardware? Contact Atari Customer Service at (408) 745-2367 or (408) 745-5759 for details.

DOS XE Sent to User Groups

Registered Atari User Groups have all recently received a package from Atari Corp. containing DOS XE and a well-organized 135-page manual. According to the letter from Cindy Claveran, Atari User Group Coordinator, the DOS may be freely copied and distributed, but users wish to receive a manual should send a check or money order for $13.50 to Atari Customer Relations, 1196 Borregas Ave, Sunnyvale, CA 94086. The new DOS has support for the XF551 DS drives, subdirectories, date stamping of files, batch files and many other features. The DOS has had mixed reviews from the first wave of users, but DOS XE has many nice improvements that may win over users of the older Atari Disk Operating Systems.

A letter has reportedly been sent to Registered Atari User Groups indicating that each group can purchase an ST for the club at cost. As of this writing, the letters had not been received by the clubs.

New MIDI Keyboard from Atari

In keeping with its high profile in the MIDI Music industry, Atari has announced that a new MIDI keyboard will soon be available and will reportedly be shown at the World Of Atari show in Anaheim, CA on April 22-23. The keyboard was reportedly designed by Mick Fleetwood of Fleetwood Mac, a prominent advocate of the Atari ST for MIDI applications.

John Townsend of Atari Corp. recently announced that TOS 1.4 has finally gone into production. For an excellent look at the new TOS and what it can do for you, check out the new issue of Atari Explorer.

Atari Explorer is beginning a new magazine for XEGS owners and Atari gamers everywhere. The magazine is called "The Atarian" and $15 gets you a six-issue subscription and Atari Game Champion T-shirt and patch. The Atarian, 7 Hilltop Rd, Mendham, NJ 07945.

Diamond GOS SuperCartridge Shipping Now

In the "race" to release a top-notch cartridge-based GEM-like environment for the 8bit Atari, ReeveSoft and USA Media have pulled into the lead with their "Diamond GOS SuperCartridge." According to Shelley Merrill, 175 cartridges have been shipped to eager Atarians. It seems there were some changes made to the system after the first 50 cartridges had been released, such as allowing parameters to be passed when executing COM files (such as ICD's time setting utilities). See the Diamond review elsewhere in this issue for more information.

GOE and Turbo-816 Update

Release of the GOE cartridge from

Total Control Systems (TCS) has been a bit behind schedule, according to David Sullivan. As of this writing, Dave has been burning EPROMS for the last couple weeks and getting the cartridges ready for shipment. An online notice from Dave states:

"I realize many of you have been waiting for GOE since late October, and I know it is hard to wait for an exciting new piece of Atari 8bit software; but I do not want GOE to be a product that is simply a toy. If GOE and the Atari 8bit are going to have a successful future together, then GOE must be a program that you will use. GOE will not be shipped until it is complete and fulfills your needs."

In a phone conversation in late February, Dave said the cartridge is now ready! The special advance order price for GOE is no longer in effect, but User Group discounts are still available. All people who pre-ordered GOE and have been patiently waiting will receive a "free bonus disk containing some exciting new software." $79.95, Total Control Systems, 4156 Tolowa St, San Diego, CA 92117, (619) 270-0111

TCS has also been working with DataQue to insure that GOE is fully compatible with the Turbo-816 kit.

The 8/16 kit hardware/software upgrade for Atari 8bit owners has been in the hands of 22 betatesters for a few months now, and DataQue has announced the following price breakdown:

Turbo-816x, pre-assembled $119.95 + 4.05 s/h
Turbo-816k, user assembly required: $99.95 + 4.05 s/h
1200 XL version of Turbo-816: Add $10 to above pricing

The following discounts are available to user group orders accompanied by a copy of the club's newsletter and to dealers: 2-5 kits, 10% off; 6-10 kits, 15% off; 11-20 kits, 20% off.

A programmer's kit is also available for $39.95 ($19.95 to registered Turbo-816 owners). The kit includes macros, system equals and other technical documentation to get you up to speed. For the latest information on Turbo-816, you can call the DataQue BBS at (419) 529-5197.

Yet Another 8bit Cartridge -- Express!

In the months since he left ICD, Keith Ledbetter has been pretty busy. His Express! terminal program has been totally rewritten and will be available on an ICD "piggyback" cartridge by June 1 of this year. The cartridge features, among others, drop-down menus similar to the IBM and ST; XEP-80 support; a full-screen editor with cut and paste, line tagging and search and replace; ability to run external programs; exit to DOS without losing carrier and more. The cartridge also supports the extra memory in your 130XE or upgraded 8bit, allowing up to 90K capture buffers on the XE. File transfer protocols include Xmodem, Xmodem CRC, Xmodem 1K (Ymodem), Ymodem Batch, ASCII and external windowed protocols. The cartridge supports all modems with an R: handler (1030, XM301, MPP, or 850-connected Hayes compatible). Retail price is $69.95 + $4 s/h, but if your order is received before June 1, you can deduct $10 for the cost. Orion Microsystems, 2211 Planters Row Dr, Midlothian, VA 23113.

Get Practical!

Purchasers of Practical Solutions' new Video Key can get a coupon good for a FREE Mouse Master, Monitor Master, or Drive Master. The offer is good on Video Keys purchased between December 1, 1988 and March 15, 1989. Coupons are available from you local dealer or you can send in your name and address, along with the "golden key" emblem from the front of the Video Key box and a receipt showing date of purchase. Indicate which of the master items you want and send it in postmarked by March 30. It's that simple.

Also available from the wonderfully inventive people at Practical Solutions is a new and inexpensive MIDI thru/out cable. This cable gives you separate connections for MIDI In, Out and Thru for compatibility with all MIDI equipment. For only $14.95, this cable is recommended for MIDI users everywhere. For details, contact Practical Solutions at their new location, 1135 N. Jones Blvd, Tucson, AZ 85716 or (602) 322-6100.

PC Ditto II

Avant-Garde is nearing completion of pc-ditto II, the hardware/software IBM emulator that runs at 4.77 MHz (full XT speed). Reports are that the emulator is cartridge-based and will be unveiled at the Anaheim World of Atari show. Registered owners of pc-ditto are eligible to receive a coupon good for 50% off the as-yet-unannounced price of pc-ditto II. New purchasers of version 2.0 of pc-ditto will automatically receive version 3.01 of the software free of charge. Avant-Garde, 381 Pablo Point, Jacksonville, FL 32225 or (904) 221-2904.

Apple //e Emulator for the ST

The December/January issue of T.H.E. Journal, an education publication, contains an announcement concerning an Apple //e emulator for the Macintosh, IBM PC/2 and Atari ST. The ST version, named "II in an ST," contains utilities for disk conversions and program development. Discount purchases and licensing deals are available to educational institutions. No prices were given. The announcement also mentioned the ability to network up to 50 work stations. Computer Applications Inc., Raleigh, NC.

MichTron Bargains on HiSoft and Fleet Street 2.0

MichTron is offering an outstanding half price deal on HiSoft BASIC and HiSoft BASIC Professional. Simply send in a photocopy of the copyright page from the manual of any commercial BASIC and you can purchase HiSoft for only $39.97 and Professional for only $79.95 (plus $5 s/h for either). This offer is good until March 31, 1989, so don't delay. See the review of HiSoft BASIC elsewhere in this issue.

MichTron is offering a similar deal for Fleet Street Publisher 2.0 from England. This package has been out in Europe for over six months and is bug-free. Normally retailing for $149.95, owners of any commercial DTP package can send in a photocopy of the manual's copyright page and get Fleet Street 2.0 for only $50 (plus $5 s/h). This offer expires on March 31, 1989. MichTron, 576 S. Telegraph, Pontiac, MI 48053 or (313) 334-5700.

Turbo–ST User Group Purchases

SofTrek's version 1.4 of Turbo–ST, the "software Blitter" that speeds up text and many GEM functions has been getting rave reviews from users everywhere. Now, User Groups can take advantage of some great deals on this must-have utility. Any User Group that can get three or more members together can buy Turbo–ST for only $35 each. On top of that, if 10 members of a club become registered owners, SofTrek will supply your group with a FREE copy of Turbo–ST. Your club can, in turn, update the copies owned by those registered users. SofTrek, PO Box 5257, Winter Park, FL 32793 or (407) 657–4611

Three New Game Releases for the ST

France-based Titus Software has been moving strongly in the ST entertainment area with hits like Crazy Cars, Fire and Forget and Offshore Warrior. Their newest release, Galactic Conqueror, is a space game combining the fast action of a coin–op machine with a good dose of strategy. According to Mike Vulpillat of Titus, the game "introduces for the first time on computer a high speed, full screen rotation when you realize a roll" with your fighter. "You can find as many as 40 sprites together on the screen, all moving in different directions." The game also features the largest sprite ever seen on a computer to date — the Imperial Enemy Ship. There are 416 planets in the game, just waiting for you to liberate them from tyranny. What are you waiting for? $44.95, Color, Titus Software, 20432 Corisco St, Chatsworth, CA 91311 or (818) 709-3693.

Magnetic Images has announced release of The Lost Dutchman Mine, a graphic adventure for your ST. Set in the Old West, the game features digitized sound, MIDI compatible music, real-time game play and over 100 mines and caverns to explore. $49.95, Color, Magnetic Images, PO Box 17422, Phoenix, AZ 85011 or (602) 265–7849.

In the midst of a debate over piracy of the F–16 simulator, Falcon, Spectrum Holobyte releases Orbiter for the ST. Orbiter is a space shuttle simulation that has been a success in the Macintosh and IBM markets. The program features a very detailed simulation and comes with excellent (and necessary!) documentation on all phases of the game. $39.95, Color, Monochrome version available for an additional charge, Spectrum Holobyte, (415) 522–3584.

Elwood Incident Draws to a Close

In the December issue of MAM, we reported on an incident in which a CompuServe (CIS) user under the name Elwood accused ST Report's Ralph Mariano of piracy. The final page on the Elwood story appeared on page D3 in the January 27, 1989 issue of the Flint Journal. Under the headline "Suspected phone hacker arrested in Genesee Twp," the article states:

"Armed with a search warrant, troopers went to the home of an 18-year-old computer hacker from Genesee Township who allegedly cracked telephone company long-distance codes and was making illegal long-distance phone calls, including some to foreign countries. Seized in the raid was a variety of computer equipment and hundreds of disks, some of which [Detective Sgt.] Jenkins said may contain pirated programs, including programs on how to bypass telephone company security codes."

Atari Show Updates

The World of Atari Show at the Disneyland Hotel in Anaheim, CA on April 22–23 promises to be a big event. Featuring everything from the Atari 2600 to the Mega4, seminars and workshops, the show should be an unqualified success. The next stop for the World of Atari is Dearborn, MI on June 24–25. Additional shows are planned for San Jose, CA and possibly Dayton, OH and Seattle, WA. Call (503) 673–2259 for more details.

The MACE-sponsored Atari show that they've been working on since September, 1988, is shaping up nicely, with commitments from ICD, Migraph, Alpha Systems, USA Media, Gribnif, SofTrek, ST Informer and Index Legalis. The Michigan Atari Computer Expo looks like another "must attend" event. User Group Information packages have been sent out to clubs in the Midwest. If your club has not yet received a kit, call (313) 973–8825 to get in on the User Group specials. The show will be held May 6&7 at the Detroit Metro Airport Hilton in Romulus, MI. Tickets are $5 at the door, $4 for User Group members. Tickets may be purchased in advance from area User Groups or directly from MACE. Contact Michigan Atari Computer Enthusiasts, PO Box 2785, Southfield, MI 48037 or (313) 973–8825 for more information.

ST Report Releases Hardcopy Newsletter

ST Report, the popular online ST magazine found on the major services and many BBSes, has announced a hardcopy newsletter available for $15 for 12 issues. According to Ralph Mariano, the newsletter is accepting no advertising in order to bring unbiased reviews to its readers. For a FREE sample issue, call the Bounty BBS at (904) 786–4716 or send email to ST Report on any of the services, leaving your name, address and phone number.

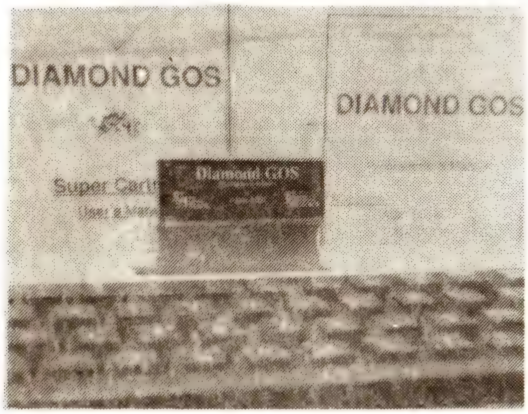
Syndicate Publishing Announces Z*Net

The producers of the online ZMagazine and STZMagazine have announced Z*Net, a User Group newsletter supplement "designed for inclusion in participating newsletter-magazines already being produced by Atari User Groups." The supplement comes camera-ready and contains national news and information. Individual clubs that chose to use the inserts pay a $25/yr fee and are responsible for the actual newsletter production and distribution, but Z*Net pays 20 cents per distributed copy above the first 100 distributed. For clubs that are currently producing a 12–page or larger newsletter with a circulation of over 100, or clubs that can "band together" to produce such a newsletter, they may find Z*Net well worth looking into. For more information, call Ron Kovacs at (201) 968–8418 or John Nagy at (517) 487–5646.

Diamond -- A Hands-on Review

by Michael Beard (TACE)

I originally heard of the Diamond Graphics Operating System through what was once Merrill Ward and Associates, but is now known as USA Media. Merrill Ward was promoting another product at the time, GOE, now being sold by David Sullivan of Total Control Systems, 4156 Tolowa Street, San Diego, CA. 92117 (619) 270-0111, and I had ordered the GOE cartridge. However, with no notice, Merrill Ward changed its name and moved.



When Merrill Ward moved, they also discontinued promoting the GOE cartridge and started promoting the Diamond GOS on disk. I had already paid $5 for a demo disk of GOE, and then had to pay another $46.36 for the disk version of Diamond. Included in this price was to be the Diamond Write and Diamond Paint programs, also on disk. However "...soon to be released..." and "...within two weeks..." stretched into over four months without seeing any sign of either of the two programs.

At the time, there were two versions of Diamond, one a 64K disk-based version and the other a 128K disk-based version for the 130XE. I ordered the 64K version and was promised I would also receive the 128K version to enable me to show it to the local user group of which I am the president.

However, (you will get tired of seeing that word in this article), upon arrival of the package from USA Media, there was only the 64K Diamond on disk, no Write, no Paint nor the 128K version.

The 64K disk-based OS had several bugs, not the least was incompatibility with SpartaDOS. I then placed several calls to Mr. Merrill, to inquire into the whereabouts of the 128K OS.

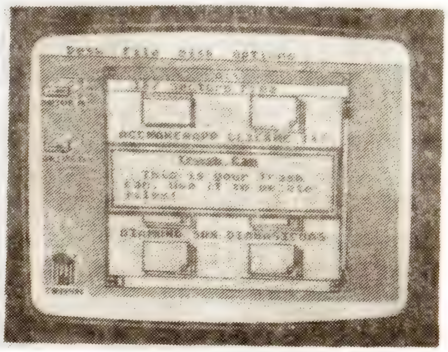
I was told that due to piracy of the 64K version, the 128K version was being stripped of functions to be made into a demo disk, awaiting the conversion to a cartridge. After repeated calls to Mr. Merrill, I finally received the 128K DEMO version. There was little improvement over the 64K version, not enough to go into here.

Mr. Merrill had verbally agreed to allow me to purchase the cartridge for only $10 and then purchase the Diamond Write and Diamond Paint at a later date at full retail, or I could pay $30 plus shipping and handling for the cartridge and then get the Write/Paint software, when released, at no extra cost. I decided to go with the $10, to save money now and to worry about the software purchases at a later date.

However, Mr. Merrill changed his mind and would not allow me to order only the cartridge. I called several times to attempt to speak with Mr. Merrill, but was always referred to another number or told he was not home After two weeks of chasing Mr. Merrill around the country, he called my home and spoke to my wife, demanding that I quit "harassing" him with phone calls. I was finally able to reach him and place my order, again, for the Diamond cartridge.

After spending over $100 on phone calls to USA Media over several months, asking about the status of the cartridge "conversion," I finally received the cartridge on January 30, 1989. In all, I spent over $180 on the Diamond products and have only received the disk based OS and now the cartridge. There is still no firm date set for the release of the Diamond Paint or Diamond Write programs.

When I received the Diamond cartridge via UPS, I immediately took it to



my computer room and plugged it into my "old" 800 as a test. Unfortunately, DOS XE, which is on the "boot up disk" which you must have to boot up Diamond, is not compatible with the old series of computers. I then plugged the cartridge into one of my 800XLs and it worked! I went to the <Config> menu and "installed" a second disk drive to the desktop. I then tried to read a directory of D2:, or B as it is referred to by Diamond, and received a disk error message.

Desk File Disk Options
Diamond
OK

The disk in drive B was a SpartaDOS disk, and the system had been booted with DOS XE. DOS XE will not read SpartaDOS, and so the error message. However, I did not realize this immediately, as I had never used DOS XE before (and never will again), and so I attempted to read the directory of drive B again. I received the same error as before, of course. I then noticed that the entire system was locked up! I could not "click" on any of the icons, nor would any of the "drop down menus" drop down. The mouse pointer would move just fine but was quite powerless.

Simple, you say, just don't try to read SpartaDOS with DOS XE. Well it is not quite that simple. Because, no matter what DOS you boot up with, you cannot use ANY other DOS at the same time. I.e., if you boot with SpartaDOS, you cannot use ANY file or program on any other type DOS disk. Yes, I know SpartaDOS usually will read MyDOS and Atari DOS format disks, but it will not when you are using Diamond. If you try to mix DOSes, you WILL lock the system up on the second try to access the disk! To get SpartaDOS to work with Diamond, I had to take Diamond out of the computer, boot SpartaDOS back up and copy the files from DOS XE to the SpartaDOS disk, and then reboot with Diamond.

You can get Diamond to work with the older series, 400/800, if you use SpartaDOS 1.1 or the SpartaDOS X cartridge. The same copy process must be followed to get any other DOS to work. You have to copy the files to the other DOS format with Diamond removed.

To format a disk with Diamond is a pretty straight forward procedure, or so you are lead to believe. Simply click on the drive you wish to format, once, then go to the <DISK> drop down menu, and select FORMAT. Answering yes to the Dialog box query, "Are you sure?" will result in the disk in the drive selected being formatted. However, if you use SpartaDOS, you cannot access the disk after formatting it or the system will lock up. Since you cannot use SpartaDOS command files that require parameter, ie. RD.COM, XINIT.COM, DATE, TIME, etc., you cannot format a disk with Diamond when you boot with SpartaDOS, nor can you SET the time or date.

If you boot with MyDOS 4.2, or versions thereof, you get a scrambled free sector count in the window header bar, and then another free sector count of 708, followed by the files that were on the disk BEFORE you formatted it, followed by another free sector count of 0625 (with DOS.SYS, DUP.SYS and the RS232 handler AUTORUN.SYS files on the disk before you formatted it). The FORMAT option in the <DISK> drop down menu seems to work fine with Atari Dos 2.0 -- correct sector count and it even erases the files that are on the disk you format. I did not use DOS XE beyond when I booted Diamond for the first time, nor do I plan to in the future. DOS XE is another great DOS from Atari, following in the infamous footsteps of DOS 3.0 and DOS 4.0, but that is a subject for another review.

When you attempt to get a directory of a MyDOS disk, only the first 3 digits of the sector count for each file is shown. For example, if a file is 0010 sectors long on a MyDOS disk, it will appear to only be 001 sector long when using Diamond directories. The total free sectors at the bottom of the file listing, however, shows all 4 digits! Directories of SpartaDOS, DOS 2.0 and DOS XE seem to work fine. If you try to read an Atari DOS 2.0 directory when using MyDOS, (which is Atari DOS compatible), it will not read the directory correctly. SpartaDOS directories do show the time/date as advertised, but as stated earlier there is no documented way to set either the time or the date using Diamond with SpartaDos.

With the Super Cartridge from ICD, that Diamond is built in, you can reportedly switch to a cartridge plugged into the top of Diamond. This feature seems to work with no problems, with cartridges like PacMan and Space Invaders, but DOES NOT work with BASIC XL from OSS/ICD. I cannot vouch for the compatibility of Diamond with any other cartridge from OSS/ICD, but the prospects would seem bleak indeed. To switch to the top cartridge all you have to do is select QUIT from the <FILE> drop down menu and the top cartridge is turned on and Diamond is turned off. To get back to the desktop you have to turn the computer off and then back on as even a cold start switch will not bring it back.

Loading a binary program with Diamond is simple. Just double click on the drive that the file you want resides and then double click on the filename when it appears in the directory. Another way to accomplish the same task is to click once on the drive icon and then go to the <FILE> drop down menu and click on OPEN. This "opens" the drive and shows the directory. Then do the same for the file you want to run. It is the same no matter which way you decide to do it.

I tried booting the Express telecommunication program from Diamond and was pleasantly surprised to find all of Express's features worked as usual! To exit Express, I usually hit the RESET button and exit to SpartaDOS. However, when I did that with Diamond installed, a row of repeating Ctrl-A's filled the screen. I hit my cold start switch, which resulted in my being returned to built-in BASIC. When I typed DOS I received the D1: prompt instead of the Diamond desktop. I was forced to turn the computer off and then back on to get back to the desktop.

One nice feature of Diamond is the drop down menus. If any of you have ever used an ST, you know how irritating the drop down menus are at the top that drop down simply by placing the pointer on one of the menu titles, but will not go away until you click the mouse. With Diamond, the menus appear automatically, by placing the pointer on the menu title, but they also disappear as soon as you leave the menu box area! No more clicking on empty space to close a drop down menu.

If you have two windows open, which is the maximum you can have open at one time with a 64K machine, and you bring the directory window that is on the bottom to the top, the directory must be re-read into memory. This takes two passes of the disk drive to do. If any portion of an icon is covered, the entire icon disappears. When using SpartaDOS, if you use the keyboard instead of a mouse-type controller, the key presses are stored in memory and displayed when you quit to BASIC!

The touch table driver that came with the cartridge on the boot up disk locks the system up when it is accessed. There is as of yet, no calculator for the Diamond desktop, nor can you change the desktop colors. There seems to be only two types of file icons, one for .APP extenders and one for all of the rest. According to Mr. Merrill, the Diamond cartridge is supposedly upgradeable through replacement ROM chips. However, my Diamond cartridge is GLUED together, so I am not sure exactly how I am to replace the ROMs, when/if Diamond is updated.

When copying files you can do it any one of several ways. One way to copy a file is to click on the file, hold the mouse button down and drag the file to the destination. You can also duplicate entire disks by dragging one drive icon onto another. You can multi-file copy by "tagging" specific files. To "tag" a file, simply hold down the shift key and "click" on the files you want to copy. When you have selected the files you want, drag them to the destination. That's it! You can also use the COPY function in the <DISK> drop down menu. There are a few restrictions that seem to be undocumented (bugs?):

- 1. You cannot single file copy or duplicate a disk to or from an MIO.
- 2. You cannot copy to or from a folder, also known as a subdirectory.
- 3. You cannot multi-file (tagging) copy to the MIO.
- 4. You can duplicate a disk to the MIO, however the MIO is then only the size of the disk you duplicated.

All of the above restrictions apply to SpartaDOS. Since Atari DOS does not support subdirectories, and MyDOS is only supported as Atari DOS, you cannot use subdirectories with MyDOS.

To duplicate a SSSD disk, it only takes 18 passes! Thank goodness for two drives! Oh by the way, for those of you with Happy 1050s, you will have to turn off your Warp Speed as Diamond will not read directories of disks that use Warp Speed!

In all, I feel that it is a shame to have one of the best computers on the market; have support for that computer dwindling more and more each day; have such high expectations for this desktop for the 8bits; and then receive such a disappointing product. I am not saying that I could do better, as I cannot even program in Assembly, and I do feel Alan Reeves deserves a lot of credit for trying. But if I had it to do over, I would not spend over $180 on Diamond. I would spend it on a hard drive for my 800XL, something that works and that I could use everyday.

Now, I know that Diamond does not sell for $180, but for the same price that Diamond sells for, you could purchase the new SpartaDOS X from ICD. Now that's a product you could use every time you turn on your computer and from what I have seen, it works! Of course, I do have a very impressive desktop to impress my Brand X computer friends with, that is until it locks up again. If the bugs I have mentioned, and there are others, receive attention and are remedied, Diamond may yet become a viable product, but don't hold your breath.

After writing this review, I may never again receive support from Mr. Merrill, but I try to call things as I see them. If you have any comments, please call the TACE BBS at (405) 793-7980 (3/12/2400 baud 24 hours a day) and leave a message.

Reeve Software

Warrenville, IL. 60555 (312) 393-2317 (301) 868-5494

Editors' Note: Having received a Diamond Cartridge in late February, I've noted some differences between the cartridge I have and the one Michael Beard has received. It seems changes were made after the first 50 cartridges were shipped, including the inclusion of the ability to passs parameters to .COM files. The disk I received was configured for DOS 2.0, though the documentation did say it was configured for DOS XE.

To copy to or from a subdirectory (SpartaDOS or DOS XE only), simple open a window containing the files to copy and a second window in which you open the folder. Drag the files from the first window to the second window. I've tested this with DOS XE and it works.

Switching from one DOS to another while using the Diamond Cartridge is definitely NOT recommended! Using Atari DOS 2.5 or DOS XE on a 130XE with RAMdisk set up worked quite well. Also, the cartridge I received was not glued together and comes apart to reveal a cleanly designed board with socketed PROM inside. I have not tested the cartridge with SpartaDOS, nor have I used anything but the ST Mouse driver.

Overall, the cartridge performed well on the 130XE with problems occuring only when going from one DOS to another. The two-window directory limit is not a restriction on 64K machines only — the Diamond Desktop does not allow more than two directories open at one time, but the documentation does state that your own applications can have up to four windows open.

Hewlett Packard DeskJet

by LeRoy Valley (TAG)

Instant success. Revolutionary. I gotta have one! Once in a great while a new product arrives that impacts the entire computer community in this fashion. Not just the Atari community, but the ENTIRE computer community.

The Hewlett Packard DeskJet printer is such a product. Offering printing resolution comparable to a Laser printer (300 dpi) at about 1/3 the cost, it puts professional desktop publishing within reach of the home computer owner.

The DeskJet is an ink jet printer capable of printing graphics at a maximum resolution of 360 dpi (most programs only support 300 dpi). Instead of using pins that strike a ribbon to print on paper (hence the term "impact" printing), ink jet printers actually spray ink through nozzles, and the print head never touches the paper.

Due to it's method of printing, the DeskJet is virtually silent when in operation. All you ever hear is a slight whisper as the print head moves back and forth across the paper. Printing speed is high -- 240 cps in draft mode and 120 cps in letter quality mode -- and print quality is excellent. Draft mode printing puts the NLQ mode on dot matrix printers to shame, and letter quality printing is indistinguishable from a high quality daisy wheel printer!

Paper handling is accomplished with the built-in sheet feeder (sorry, no tractor feed) which accommodates both letter (8.5" x 11") and legal (8.5" x 14") sizes. The sheet feeder holds about 100 sheets of paper. HP was even thoughtful enough to provide you with the ability to feed in envelopes! (But only 1 at a time...sigh). In operation, the DeskJet loads sheets from the lower portion of the feeder, and deposits finished sheets in the upper portion.

Ink jet printers have been notorious for clogging up (due to improper cleaning, bad ink, or worn out nozzles), but HP has solved this problem by using a disposable ink cartridge that includes the nozzles! Each time you replace the ink cartridge, you get a new set of nozzles. No muss, no fuss, and best of all NO cleaning! Replacing a cartridge is as simple as snapping it in place.

The right hand side of the DeskJet sports two cartridge slots and a key pad for changing settings. The cartridge slots can hold a variety of goodies like font cartridges, a 128K buffer cartridge, and an Epson FX-80 emulation cartridge.

The emulation cartridge is a MUST. With this plugged into one of the slots, your DeskJet looks and acts just like an Epson FX-80 printer.

The stock DeskJet is compatible with the HP LaserJet line, and many programs do not supply you with drivers for HP LaserJet printers. (Like Print Master and Certificate Maker). Also, the only internal font supplied with the DeskJet is Courier, and it's only available in pitch settings of 10, 16.67, and 20. You get standard text options like bold, underline, and super/subscripts, but you don't get italics. The Epson FX-80 cartridge gives you Pica, Elite, and compressed, and also gives you italics! Looking at all the font cards available, the emulation card is the best buy.

BUT...(you knew there had to be a but, didn't you?), when the emulation cartridge is plugged in, you've got an Epson printer. You can't switch off emulation mode with a hardware switch or an escape code. The only way to make your DeskJet act like one is to remove the cartridge! It's a simple task, but it annoys me! I'd love to be able to software select it... heck, I'd settle for a simple switch located on the cartridge.

DeskJet

Now that you've got that new DeskJet printer and you're using it for desktop publishing, what would you give to reduce your printing time considerably? $40 or $50? Well, then, read on!

Both Migraph and Neocept have released GDOS drivers specifically designed for the HP DeskJet printer, and both claim that their driver will enhance the performance of your DeskJet printer. Since these drivers are GDOS drivers, they will only enhance your DeskJet's performance for GDOS applications. Programs in this realm include Timeworks Publisher ST, Easy Draw, Word Up, Athena II, LDW Power, Super Base Professional, and anything else that uses GDOS.

Both packages simply replace your existing driver and your fonts with the custom driver and 300 dpi fonts (unless you already have 300 dpi fonts). After installing the drivers, the first thing that I tested was the speed of each driver. I tested both drivers on four applications. Both drivers were considerably faster than the standard drivers. As an example, printing the same page with all three drivers on Publisher ST, I got the following results:

NOTE: The other font cards that are available simply add a new font to the DeskJet. They don't affect the operation of the printer and they can be left plugged in all the time.

HP sells a 128K buffer that takes up one slot — you can even plug two of them in and get a whopping 256K! I opted for an external 256K buffer. It was considerably cheaper and I've still got two cartridge slots left to plug in goodies!

The key pad has 8 keys on it. The lower four keys let you do a form feed, select the font, select the mode (Draft or Letter), and set the printer On line or Off line. The upper four keys let you move the paper in fine increments in and out, feed envelopes, prime the ink cartridge (this is only done when a new cartridge is installed), and reset the printer.

Now that you've got an idea of some of the features that this printer has to offer, the next question is "How does it perform?" Since it's compatible with the HP LaserJet printers, any program which supports that printer also supports the DeskJet. I've tested it extensively with Timeworks Publisher ST, Publishing Partner, Page Stream, Word Up, Easy Draw, and Athena II. The output in all cases is superb. In fact, when compared with the Atari Laser Printer, the output is actually sharper and shaded images look much better! The only drawback to the DeskJet (when compared to a laser printer) is speed. With laser printers we're talking upwards of eight pages a minute! With the DeskJet, you're looking at about 8 - 10 minutes per page (in a desktop publishing environment).

To perform an actual speed comparison with the Atari SLM804 Laser printer, I used the same Timeworks DTP file for both printers. The file included both text and graphics. The time to print the test document on the SLM804 was 52 seconds, while the DeskJet took 3 minutes and 26 seconds. The next speed comparison was a simple screen dump using the ALT-HELP sequence. The SLM804 took 18 seconds to print the screen while the DeskJet took 2 minutes and 5 seconds.

Using a print buffer speeded up the final output by about 20% and cut the cpu time by 50%! Printing a full page from Publisher ST took 17:25 without a buffer and 12:00 with a buffer. (These figures were obtained using the standard HP LaserJet driver supplied by Timeworks. Using a driver specifically designed for the DeskJet can reduce these times considerably. See the driver review below.)

What else do you need to know about a printer? It's quiet, it's extremely fast (compared to a dot matrix), and output is superb.

Should you buy a DeskJet instead of a 24 pin printer? The answer is YES. It's not that much more money, and the output is considerably better (the resolution of most 24 pin printers is 180 dpi, the DeskJet's is 300 dpi). The biggest argument I hear against the DeskJet is that it can't do labels. WRONG! Avery Laser labels (#5260) work great!

Should you buy a DeskJet instead of a laser printer? You have to make that decision yourself. A laser printer is considerably faster, but it also costs *a lot* more. Yeah, yeah, tell me about

Drivers: Migraph and Neocept

	Computer Finished	Page Ejected
Standard	17:25	17:25
w/buffer	12:00	12:00
Neocept	10:00	10:55
w/buffer	4:20	8:35
Migraph	10:36	10:58
w/buffer	4:15	8:45

The "Computer Finished" column indicates when my computer was done sending data to the printer. The "Page Ejected" column indicates when the printer finished and ejected the page. As you can see, the buffer really reduced the throughput time! The times posted by the Migraph and the Neocept drivers were so close, that I have to call it a tie. Both drivers also allow you to either print out documents at either 150 or 300 dpi, but the methods that each uses are different.

The Migraph driver requires you to either install two different sets of fonts and then switch between assign.sys files (an easy proposition using G+PLUS) or you can use their Outprint program (supplied with the driver) and select the driver you want to use. I found this method somewhat awkward to use. The Neocept method was much easier. Using the standard Atari Control Panel, simply select Draft or Final from the printer setup screen. That's all there is to it! A very nice touch! Score one for TurboJet.

Documentation for the Migraph software included two 8.5" x 11" pages with enough information to help you get it installed. Neocept provides you with a professionally done manual which includes instructions to install their product for Word Up, Microsoft Write, Easy Draw, Publisher ST, and Other programs. Neocept even includes an INSTALL.TXT file for Publisher ST. After replacing the file on the Timeworks Master disk with this one, you'll be prompted for the TurboJet disks when doing an install. Very nice touch! Score another one for TurboJet. Migraph was nice enough to include a screen dump program for the Deskjet. It works well and it's very fast. Once again, nice touch. Score one for Migraph.

Score is TurboJet 2, Migraph 1. I use TurboJet because of the ease of switching between final and draft modes, but I really like the screen dump program from Migraph. TurboJet, by Neocept, retails for $39.95. The Migraph HP DeskJet driver retails for $49.95.

the laser printer you saw in Computer Shopper for $799. Then add another $300 for the HP laser emulation board (that is, if you're planning on using the printer for anything useful), and add another $500 to upgrade it to 1MB.

You don't need 1MB? If you're printing full page graphics you do. Laser printers (due to their design) have to print a full page at a time, and 512K just doesn't cut it. Now you've got $1600 tied up in your laser printer -- just to print faster than me. Oh, and by the way, you've got to keep that sucker clean. You don't want any streaks or blurs on your printouts, do you?

The only maintenance on the DeskJet is to replace the ink cartridge about once every 1000 pages (this figure can vary anywhere from 500 - 1500 pages depending on the type of printing you do) and put paper in the feeder. For the average home computer user, I think that the DeskJet is a tremendous buy!

I purchased my printer from Applied Progressive Electronics (1-800-447-1176) for $675 + $12 shipping. The Epson cartridge was $55, and the ink cartridges were $14. The folks at APE were very helpful and they are authorized HP dealers.

VIDEOKEY

RGB to color composite converter for the Atari ST

With VideoKey, now you, too, can experience the fantastic color and sound of Atari's games and graphics on any television, big screen or composite monitor! Its design provides the highest quality color composite video and RF output possible for any Atari ST, not just those that are RF equipped. Standard RCA jacks allow for easy hook-up. Optimized for low resolution use.

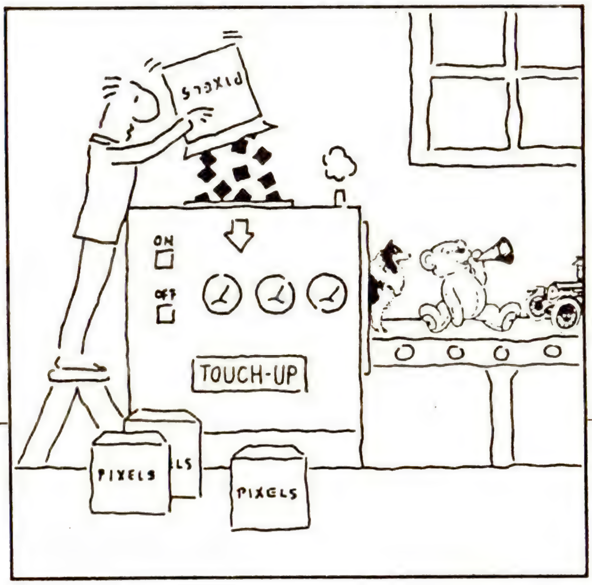
Give your desktop graphics that professional touch.

Introducing Migraph Touch·Up™



Migraph Touch-Up is the complete design tool for high-resolution monochrome images.

Create, edit, enhance—you can do it all with Touch-Up.

And do it better, because Touch-Up is the first "virtual page" graphics program for the Atari ST.* A sizeable advantage indeed!

Touch-Up can handle bit-mapped images of any size and resolution (based on available memory in your computer). Which means you can now produce pixel-perfect images for all your publishing projects.

Migraph Touch-Up. A powerful tool for professional-quality results.

Ask your dealer for a demonstration of Touch-Up, or call Migraph's toll-free number for more details.

The Tweety Board From Practical Solutions

by ASTI (GLASS)

This is one hardware review that brings great pleasure and appreciation for the capabilities of my Atari ST.

The Tweety Board's purpose is to bring the terrific sound that's hiding inside the ST out to be appreciated by the computer user. The ST computers employ a 3 channel sound chip from Yamaha for use with the MIDI ports in the recording and producing of MIDI music. Some of which is done professionally by famous groups like Fleetwood Mac.

Some computer owners have MIDI capable keyboards, synthesizers, digital drums, and other instruments through which they can appreciate the three channels of sound (voices?) from the ST. But the rest of us have only had the small single monitor speaker with which to listen to the sounds from this computer, not knowing or experiencing the beauty locked in the heart of the ST.

All three channels from the sound chip are merged into one channel internally in the ST to produce the MONO sound. Now comes the Tweety Board!

The advertisement read "Easy Installation, no soldering!" When the Tweety arrived (UPS, only 3 days after ordering!) and was removed from it's packing, I found myself holding a small printed circuit board with cables dangling from each end.

Playing it smart by going to the small manual first, I was impressed by the neat, complete, and thorough instructions provided. The booklet included separate instructions for the 520ST, 520STfm, 1040 ST and the Megas.

Seeing as the installation was going to be demonstrated before the local user group, I figured it would be proper to try it at home first. First I tried installing it in the club's 1040ST.

Wow, that was easy and fast! Took me 17 minutes and only one try. These instructions work! So, let's see what kind of sound this thing will produce.

First, let me explain that the Tweety provides for 3 channels of sound. Keeping in mind that the output of the Tweety has to be fed to an amplified speaker, how does one deal with a stereo amplifier that has only 2 channels?

"This Tweety Really Sings!"

Not to worry, Practical Solutions included a small splitter patch cord that allows you to combine any two of the three channels.

So, without further ado, I plug the two channels into the input of the stereo with six foot patch cords from the local electronic store (Radio Shack), put the speakers on each side of the computer desk for good sound separation, and run a music program on the computer that normally outputs to the monitor speaker.

Dyn-O-Mite! Awesome!

The sound is clear, clean, mean, and in STEREO! Okay, let's not get excited, boot up a game. Shazam! The sound effects are realistic.

Oh-oh, the dictator is telling me to turn down the noise...no problem, slip on the ole' headphones.

Back to the music, this is great, now all of the music files that I downloaded from the local BBSes can really be appreciated!.....But I'm digressing from the planned hardware review. Let's be more business like. Ahem.

Within another 1/2 hour the installation was made in a 520ST and 520STfm with the same results. It's true, there's true stereo sound here!

The installation demonstration at the GLASS user group goes just as smoothly, less than 20 minutes (some screws were already pulled from the case to save time) and everyone can see how easy it was to install.

Another club member also purchased a Tweety and described his permanent installation and how he used a separate amplifier and speaker with his stereo to get all three channels of sound, which is even more impressive.

Question: If one channel is monaural and two channel is stereo, what do you call three channel? Triaural?

Hey Practical Solutions... are you now going to build and sell a small three channel amplifier for the Tweety Board? I'll take one.

ITEM: Tweety Board
PRICE: $59.95

Some Spellers are Better than Others.

Before she won her regional spelling bee, Margaret Hollingsworth pored over seven different dictionaries for more than three hundred hours.

And while we'd all like to be champion spellers, most of us just don't have that kind of time.

So may we suggest putting the WordPerfect® Speller in your corner.

Not only will the Speller check your document (or any section of it) for errors and double words, it will instantly count the words in a document, page, or block of text.

You can look a word up phonetically to find the correct spelling, and the Speller will give you a list of replacement words with similar sound patterns. Or if you're looking for just the right word, and you know it begins with "s" and ends in "-ology," use a wild-card character to replace the unspecified letters. The Speller will show you a comprehensive list of your options.

With the WordPerfect Speller (included in your WordPerfect software for the Atari), more than 115,000 words are at your fingertips. No other speller can match that kind of power.

Not even Margaret.

The Unintentional, Unexpected, Unwelcome, Uncontrollable XBios-Virus

by Dorothy Brumleve

Copyright 1989 by D.A. Brumleve. All rights reserved.

Recently, I've written several children's programs in GFA Basic in which data files can be saved to and loaded from disk. These programs use no form of file selector box — the program knows what the file names are/will be, and simply clicking a LOAD or SAVE box on the screen initiates the procedure.

I've done very little error-trapping in my programs, but since multiple disk accesses add considerably to the potential for user error, I decided I would install some "traps" in my latest program. Without such traps, my young users are presented with a GEM alert box, proclaiming in decidedly adult language they must "Remove the Write-Protection" for example. I would rather that my users never see such a message.

It so happened that my husband, Tim, had written a MIDI-related program in which errors were handled gracefully. Tim's code checked for errors while saving a file, such as write-protection, an improperly formatted disk, and no disk in the drive, using an Xbios call as follows:

```
A%=Xbios(9,L:Buffer_address%,
L:1,Device%,Sector%,Track%,Side%,
Num%)
```

He attempted to write to a nonexistent sector. If the disk was good, the result of the call should be "-8" which means the sector wasn't found.

To check for an improperly formatted disk or no disk in the drive when loading, the critical call was another Xbios command:

```
A%=Xbios(8,L:Buffer_address%,
L:1,Device%,Sector%,Track%,Side%,
Num%)
```

Now, almost all the books discussing system-level commands such as Xbios include a little warning to the effect that you'll be sorry if you use this command. And I was sorry.

I made a copy of Tim's listing and proceeded to transfer the relevant code to my own program. I added cute little alert boxes to announce each error; in these, a declining scale was played while an informative message was displayed and the word "Argh!" was written five times down the screen.

All seemed to go well at first. In testing my program, if I tried to SAVE to a write-protected disk, sure enough, my cute little alert box appeared ("Maybe you need to close the little hole in the corner of the disk. Argh!...") and then the program would resume.

If I tried to SAVE or LOAD when no disk was in the drive or the disk was inappropriately formatted, again my alert box appeared ("Oops! Do you have a disk in the drive? Argh!...") and the program would resume. And if I tried to load from a disk that didn't have the file the computer was looking for, my alert box announced the error, and the program would resume.

Yes, the program would resume, and it resumed to do evil works.

If I attempted to load from a disk that did not have the sought-after file, the computer would never bother to read the disk directory of a subsequent disk! And it would do bad things to the subsequent disk, and the disk after that, and the disk after that. It would simply announce that the file was not found — even if I knew the file was on the disk in the drive!

After the first few tests of my new code, I came down to the desktop to take a good look. Sure enough, none of the disks had the expected file! But I was sure I had saved it on every one of those disks! What was happening? Obviously, my program was deleting the file.

Back to coding, I changed some things around and ran some more tests. When I returned to the desktop this time, a very big surprise was waiting.

It seems that the directory of one of my test disks had been supplanted by the directory of another, but the files themselves remained intact (they were simply renamed). For example, if I ran "GFABASIC.PRG" on this disk, I wound up looking at a previously-compiled version of my own program, not at the GFA Editor screen.

No, my program wasn't really deleting files, it was rearranging the directories on my disks. Some of the disks involved in this first test were important ones. This explains why I no longer have a single copy of any version of this program written before I put in the Xbios commands.

Ten disks later, I thought I had the problem licked.

Normally, the If Exist(Filename$) command will cause the computer to look at the directory and see if the filename is present, but somehow the Xbios commands were interfering with the function of my subsequent If Exist. If I forced the computer to read a directory by using the Files or the Dir commands, the error-trapping seemed to work.

Unfortunately, both Files and Dir cause the directory to be displayed on the screen, something I did not want to happen in my program. I finally discovered that I could cause the computer to Open, Close, and Kill a new file, and after that, it would read the disk. The error-trapping was then successful; I could load from a new disk even if the previous load from another disk had been unsuccessful. However, the kinky directory-swapping/overwriting/deleting didn't end. Error-trapping at the expense of disk directories isn't worth it.

I gave up in disgust and told Tim about my miserable state of frustration. What? Hadn't I looked at his code? he wondered. He scoffed; I must have made serious mistakes in the transfer between his program and mine, and he spent virtually all of the next twenty-four hours failing to prove it.

The main problem, as I saw it, was this: when you are presented with a file selector box, you can force the computer to read the disk by clicking in the upper margin of the box frame or on the "X" in the upper left-hand corner. I needed some way to convince the computer to simulate that action even without the benefit of a file selector box. Tim did his coding on the computer I usually use for programming, so while it was busy, I went downstairs to my communications computer and shot off a rambling and incoherent letter, including my code, to my friend John B. Holder of Marathon Computer Press. John has been into computing since he was a small child, and I figured, if John doesn't know how to do it, then no one does.

Turns out, no one does, at least not with GFA Basic. I had tried, Tim had tried, and now John had tried, and the program still didn't work. And so I took out the Xbios commands, the error-trapping, the cute little alert boxes with a declining scale and "Argh!" written five times down the screen. My latest program has no more error-trapping than the first, and my little users still have to deal with a GEM alert box if they try to save to a write-protected disk.

The episode was not without some positive features: I am positive, for example, that I will not copy any Xbios command out of someone else's program without extreme caution. I am positive that I will heed the little warnings in programming manuals. And I am positive I'll never experiment with the Xbios command using a disk unless I'm ready to reformat it anyway.

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory
(Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

Digisound ST

● ● ● ● ● ● ● ● ● ● ● ● ●

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

● ● ● ● ● ● ● ● ● ● ● ●

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. ● The first and only full color digitizer for the ST. ● Uses standard video inputs like video camera, VCR, or video disk. ● Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. ● Pictures can be used with Degas, Neochrome, Powerprint and others. ● Automatic calibration of contrast, brightness and white balance. ● Plugs into cartridge port for easy set-up. ● Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC**, and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only $39.95

Polydisk

Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

HiSoft BASIC -- The New Standard?

by Michael Bonkowski (MACE)

In the beginning, when a user purchased an Atari ST, he or she was left with ST BASIC or Logo. Or if you could afford it, you could buy the Atari Developer's Kit which gave us C. So, we plodded along with ST BASIC and hoped that something better came along.

Soon, GFA BASIC became a standard. It allowed the user to program in an environment free of the multi-window interface of ST BASIC. And being BASIC, most users quickly adopted it as the "unofficial" language for the ST. But, certain abilities, like the ability to create desk accessories were beyond GFA's reach. But, dear ST users, a "Superior" BASIC has arrived.

As I write this, Michtron and GFA Systemtechnik have parted company, and Antic will soon be GFA's new U.S. Distributor. Meanwhile, MichTron has an "ace" in the hole -- HiSoft BASIC and it's powerful counterpart, PowerBASIC.

For the sake of example, I am going to compare HiSoft BASIC version 1.23 to GFA BASIC version 2.00. HiSoft is completely GEM Based. All desk accessories are available under the "DESK" drop down menu, whereas GFA uses a non-standard menu bar. HiSoft BASIC is a compiler BASIC, meaning that all programs will run at almost machine language speed. No "Run-Time" programs are required. The files that are created are .PRG, .TOS, .TTP, and if you purchase PowerBASIC, you even get the ability to create .ACC files! Try doing that with GFA.

Meanwhile GFA, is a interpreter language. All programs that are not compiled require the GFA Run-Time Program. Even with the Run-Time Program, the BASIC is still interpreted. The only way the user can have a compiled program is to purchase the GFA Compiler, at additional cost. HiSoft BASIC allows the user to load and run ST BASIC programs directly; no conversions are required. GFA would require a large amount of conversion to accomplish the same thing.

PowerBASIC also allows the use of User programmable libraries written in assembly language. It also includes "Program Profiling" which allows the programmer to find out where the program spends its time, on a line-by-line or a procedure basis. It even includes a stand-alone compiler without a editor, for users who prefer a CLI-type environment.

After booting the program, I tried first to run ST BASIC programs. But, as soon as I tried to run it, it generated a error. I found that some of the variables commonly used is ST BASIC are reserved words in HiSoft BASIC. One such word is MOUSE. No problem, since HiSoft BASIC has a Search and Replace feature. I replaced all instances of MOUSE with MICE, and the file ran fine.

This BASIC is compatible with Microsoft BASIC, QuickBASIC, and Fast BASIC. Although, Fast BASIC requires the use of a conversion program which is included. So, I tried the following, I took a file which I wrote in Atari Microsoft BASIC II, and ported it over to the ST. I ran the conversion program in the DCopy 1.9 to convert the file from 8bit text to 16bit text. After doing that, I loaded the file into HiSoft BASIC and ran the file. Now to be fair, the file I used was a text adventure which made no special calls to the OS.

Now for a Acid Test. I took a demo written in GFA called "The Hat Demo" and attempted to convert it into HiSoft. After spending approximately two hours converting it, I finally managed to get it to work. I must state that I am not fully familiar with GFA, and I, being a carry over from Atari BASIC on the 800, cannot program without line numbers.

Now, according to the GFA version, the program should take approximately 4 to 7 minutes depending on resolution and whether the program is compiled. My version took seven and a half minutes compiled. I found out that a MOUSE -1 command hides the mouse pointer. Now my version finishes in just a hair over four minutes. That's even without adding any other features that are HiSsoft specific.

You can also add GEM windows, Dialog Boxes, etc. using a INCLUDE command. This function should be recognizable to all the C programmers out there. There is even a program included on the disk to convert C programs into HiSoft. And since the files are saved in ASCII, you can easily use a different text editor or word processor should you dislike the HiSoft Editor.

MichTron included on the HiSoft BASIC Disk several example programs, including the Byte Sieve, Byte Calc, and Tower of Hanoi. The first two programs listed are the same two programs that give the listed benchmarks in the magazine ads. The other one is a program that really shows what a compiled BASIC can do. Watching flashes on the monitor screen while the program moves the pictured rings around is a sight. You can't even keep track what ring is on which post, unless it doesn't move often. Also on the disk is a file called CHECKST.PRG. Should you have a problem with the BASIC, this program supplies MichTron with enough information to hopefully find the problem and correct it.

Michtron also offers a upgrade option to HiSoft BASIC owners. Should you wish to upgrade to PowerBASIC, just send your owners manual, original disk and difference in the price between HiSoft BASIC and PowerBASIC.

Now, since this superior BASIC is in a early version, there a bound to be bugs. So far I have found no MAJOR bugs, but one minor bug exists. I am not going to go into detail of the bug, because it is minute problem.

I could suggest some improvements even in the manual. For example, the manual contains 387 pages, and NO Index! And of the 387 pages, almost 200 pages describe the reserved words. Now, that's fine for someone who knows a lot about BASIC, but for a newcomer, you would need to get a book to learn to program BASIC first.

Also, as this review is being written, MichTron is continuing its special offer. If you send a photocopy of the copyright page of ANY commercial BASIC, you can receive HiSoft BASIC or PowerBASIC for HALF PRICE! You can get HiSoft BASIC for $39.97 or PowerBASIC for $79.97 (Plus $5.00 shipping and handling). According to the article, this offer ends March 31, 1989. So hurry!

Overall, this BASIC is a welcome alternative to the GFA BASIC dominated ST world. If you enjoy programming in a structured environment, HiSoft allows this. And if you prefer programming with line numbers, like I do, HiSoft is your best bet. My own opinion is "Good Bye GFA" and get your hands on HiSoft BASIC or PowerBASIC. You won't be sorry you did. I'm not!

[Author's Note: As I was just about to send this review out in the mail, I read that MichTron has renamed PowerBASIC to HiSoft BASIC Professional.]

XL Keyboard Mylars in stock now! $22 ea
In Stock 130XE Cartridge Connectors $6.30
Many people have asked which Mailing List program we use at Best Electronics, we currently use Super Mailer+ from Royal Software. Super Mailer program (D) $39.95
XL to XE Software Compatiablty Mod by Tom Lawless. This two chip/switch mod is for enhanced 800XL computers (256K-512K). $8
Hardware upgrade kits and P.C. boards that require the 41256K ram chips have been put on hold because of the high price of ram chips. We hope to ship again once ram chip prices start to drop down!

For 520ST. 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.
Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A:Socketed, no RAM	$ 129
520B: 1 MB, socketed	$ 299
520C: 2.5 MB, socketed	$ 595
520D: 4MB	$ 995
520-1:1 MB, non-expandable	$ 249
1040A: 1 Bank sockets, no RAM	$ 110
1040B: Fully socketed, no RAM	$ 149
1040C:2.5 MB + 1 bank sockets	$ 595
1040D: 4 MB	$ 995
1040K: Kit w/all parts, no RAM	$ 68
Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 12-19-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.
Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available!
Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Amaze Yourself with the Amazing Construction Set!

by Bob Retelle (MACE,WAUG)

The Amazing Construction Set Demo is a little gem of an ST program that's been floating around on BBSes for a couple of months. I downloaded a copy from the AtariArts Forum on CompuServe a little while back, and just got around to looking at it last week. Anyone with a combination of one or more kids and any number of rainy days will love this "amazing" program!

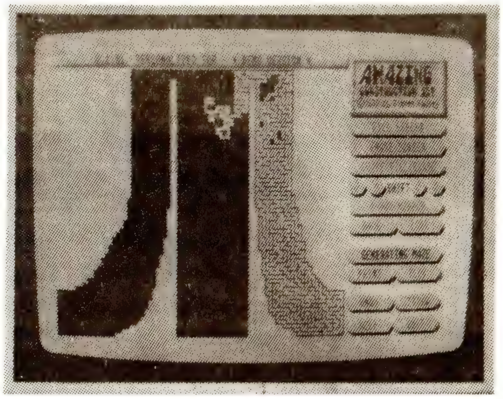
Written in Personal Pascal by Steven Pauley, the Amazing Construction Set (ACS) combines a simple drawing program with maze generating and printing routines, all wrapped up in a very professional-looking package. The ACS is being commercially distributed directly from the author for $14.

The demo version is fully functional, but the ability to Save pictures to disk has been disabled, and some of the final options are limited to being used twice. The program will run on any Atari ST with a color monitor.

Basically what the ACS does is to let you draw simple shapes and pictures, then it turns them into mazes similar to the ones you sometimes find on paper placemats in restaurants.

The program comes with quite a few pictures to use as samples, or to modify further. Simple shapes like Pac Man, hearts or smiley faces work best, with the size of the picture determining the level and complexity of the maze you created.

The drawing section is done on a 78x63 grid and includes the basic functions of draw and erase and filling or clearing the entire screen or a specific section. Once a drawing is completed, the program checks to see that all the borders are continuous, then the maze is created within the outline. You can even select from among several choices for the Start and Finish of the maze. Each maze is created randomly, so every time you run the "Generate Maze" function a different maze will be created. A very helpful Undo function is available to recover from "oops" situations.



To give a better idea of what the ACS is all about, the illustration shows an Atari symbol I made up in a couple of minutes. With a little more time, I could have evened up the sides and made it completely symmetrical, but even the quick drawing isn't too bad once it's fully converted into a maze.

The picture shows the program in the middle of creating a maze within the outline of the Atari symbol.

Once your maze is completed, you have several options. You can solve the maze on the screen or have the computer solve it as you watch, but the most useful option is to print the maze out on paper. The ACS works with any Epson compatible printer and allows printing in three different resolutions.

I tested the program using two bored 12-year-olds on a dreary winter day. The testers' comments ranged from "Oh, neat!" to "This is TOO hard!" The documentation mentions that the larger sizes can be difficult to solve, but they stuck with it, resulting in some quiet times for everyone. Next time, they want to make their OWN mazes!

The author mentions that his 8-year-old son likes to run the program, and the Amazing Construction Set can be a valuable creative tool for children of many ages. Teachers could make good use of the ACS, and I'll bet that a club newsletter or two could be spiced up with a maze in the shape of the club logo!

The full version of the Amazing Construction Set can be obtained by sending $14 to:

Steven Pauley
2547 83rd Court North
Brooklyn Park, MN 55444.

The author mentions that he will also include four other programs he's written, on the disk with the ACS. This uniquely creative application is highly recommended!

Prism Magazine for the 8bit Atari

by Bob Retelle

This month AIM has something special for its 8bit readers — the first edition of Prism Magazine, a disk based magazine with games to play, articles to read, a useful utility program and some educational programs.

Like most things in life though, there's a catch. This isn't a NEW enterprise, or one that's likely to be continued. This first (and most likely, last) issue of Prism Magazine was created in 1982 but never released. Now, through your User Group and Atari Interface Magazine, you can own a real "collector's item!"

Back in 1982, there were a couple of "Disk Magazines" available for the 8bit Atari, but John Wilson and I weren't very satisfied with the ones we saw. John and I had been writing games and programs for the Atari, and before that, Ohio Scientific computers, both for my company, Pretzelland Software, and John's Unicorn Software.

We decided that we could do better than the existing disk magazines, so we formed Magnetic Publications and eventually came up with the name "Prism Magazine." (I think it had something to do with the colorful nature of the Atari... boy, it HAS been a long time!)

We planned on six issues a year, with each disk as full as we could make it (the editorial on the disk proclaims our unofficial goal of an "ERROR 162" for every issue). We had hoped to attract other programmers and writers, but we figured we could fill at least the first year's disks ourselves if necessary. Besides programs and articles, we also wanted to include useful subroutines and character sets our readers could use in their own programs (which they would hopefully then submit to us for publication!).

John had been working with the Voice Box synthesizer from the Alien Group company and was interested in including speech in many of our programs. We'd considered adding Voice Box dictionary files containing phonetic translations we'd worked out for the programs, as well as those submitted by our readers.

Since then, John has worked out a VBI routine for the Cheap Talker speech program that allows a program to speak without having everything screech to a halt (you may be seeing this application in a future issue of AIM).

Since both of us had young children, we wanted to include educational programs, and since we were both game players, we were going to start a "National High Score Hall of Fame" to be included in each issue. Also, the programming techniques used in the games on the disks were going to be the subject of a series of tutorial articles.

PRISM
MAGAZINE
NUMBER ONE

After much planning, we got our programs together and I wrote the "shell" program that handles loading and displaying the text articles, and also loads and runs the games.

The first issue was assembled, the DOS was played around with (we expected that the disk would be pirated, but we hoped that the entire disk would be copied and kept together), and the write-protect tab was stuck on the very first Master Disk.

Unfortunately, the timing of our project was all wrong. The Atari market was starting to die out (the first time), and it didn't seem like a good time to try introducing something new. The disks went back into their holders, where they've remained until now.

Recently though, John and I were talking about the "good old days," when you could control an entire character set with just one POKE, and the only "memory management" you had to do was worrying about running out at 48K!

(For an idea of just how old this disk is, check out the line at the end of the Editorial that says "Atari is a trademark of Warner Communications!" John suggested that it would be better to just give the Prism Magazine disk to the User Groups, rather than have it go to waste.

Since AIM doesn't have a disk edition yet, what we're going to do is to make the disk available to the User Groups, and to upload a Diskcommed version to CompuServe and club BBSes. The individual files are still copyrighted by John Wilson and myself, and the entire disk is copyrighted by Magnetic Publications, but it may be freely distributed, as long as it is unmodified.

If you'd like a copy of the Prism Magazine disk, but you don't have access to any of the club libraries or BBSes, you can send $3 for shipping and handling to

Atari Interface Magazine
3487 Braeburn Circle
Ann Arbor, MI 48108.

The contents of the disk are an Editorial, introducing the magazine and some of the ideas behind it, then a short "In This Issue" file introducing the articles and programs.

Then there's an educational program written by John Wilson to introduce very young children to the concept of naming colors.

The program uses the Alien Group Voice Box to speak directly to the child, and to give supportive encouragement. The instructions on the disk give details on how to customize the program to include your child's name. This program can ONLY be used if you have a Voice Box connected to your computer!

Next is a Utility program that John wrote to aid programmers who want to include machine code subroutines in their BASIC programs. It will convert a binary file into DATA statements which can be ENTERed into a program.

The first of our games is one I wrote called "Air and Sea Patrol," inspired by an old 2600 game cartridge. (I used to waste countless hours standing in Sears playing that game on the demo units!)

It uses the seldom encountered Wide-Playfield option, and has Display List Interrupt and Vertical Blank Interrupt machine code for color, sound and character set animation. You have to blast planes and submarines with your destroyer, while avoiding their bombs and torpedoes. Anyone who's ever used an Ohio Scientific computer will probably recognize the character set in this game!

The next game is "Kamikaze Saucers," which John wrote, and which uses Vertical Blank to move players and strings to move the graphics. It's a horizontal scrolling, rotating gun turret, in which you have to defend against the alien saucers that are crashing into your station.

"The Playground Maze" is an educational "arcade" game that I wrote for preschoolers. Many times smaller children are attracted to computer games, but find most of them too fast or challenging for their motor skills.

This game is completely nonviolent, and can be played at the child's own pace. It introduces problem solving and gives practice in counting and the alphabet. There's a little man lost on the play ground, and the child has to lead him back to his house, through all the obstacles that are scattered around.

The fourth game is a logic puzzle from John, called "The Rings of Atari." It's modelled after one of those simple looking, but devilishly difficult chinese wire puzzles. All you have to do is turn off all the lights.. ah, but there's a slight catch...

Finally, there's an article giving tips on how to win at "Wayout," one of my favorite 8bit games, from Sirius Software. We'd planned on running a series of these "Playing Tips" articles for popular Atari games.

If you like what you see on the Prism Magazine disk, let us know through AIM, and we'll see what else we can dig up and dust off. John has several other games that he's finished, or are near completion, and I have a few things that I just KNOW are around here somewhere.

If there's enough interest, we can either run the programs and articles here in AIM, or maybe even put together some more "issues" of Prism Magazine!

Beckemeyer Development Tools
478 Santa Clara Ave. • Oakland, CA 94610
Serving the Atari ST Community Since 1985

Hard Disk Toolkit **$29.95**
Fast, Reliable Disk Backup
- Backup files too big for one floppy disk
- Automatically formats on the fly - up to 4Mb per disk
- Up to 1Mb/min - no need for 1Mb RAM or RAM disk
- Restores files even from damaged floppy disks
- Tells how many disks are needed in advance

Hard Disk Sentry **$49.95**
Repair & Optimize Disk Partitions
- Invaluable to Hard Drive users - also works on floppies
- Typically takes less than one minute for all partitions
- No programming experience required - fully automatic

Hard Disk Accelerator **$39.95**
Hard Disk Cache
- Dramatically speeds up Hard Disks using little RAM

MT C-Shell **$129.95**
Multiuser/Multitasking Operating System
- Fully TOS compatible - runs GEM programs!
- Up to 12 users with optional multiport controller
- E-Mail & UUCP networking available

IT'S HERE!!
ULTIMATE 2000... AND IT'S NOT COPY-PROTECTED!!
AIM
Hello, my name is Roger Rout, and Im President of ZULU SOFTWARE. You have purchased a fine product here, and we have heard your cry for no copy protection...
ZULU
What?
So, in an effort to side-step the various forms of protection, and still deter the PIRATING of this fine product, we have added a few safeguards...
THIS IS STUPID!!
Well, I... Yes...
I guess I wouldn't...
Gee,.. I really haven't...
On the screen before you you will notice two boxes one red and one blue. Please place the thumb of your left hand on the red and your right thumb on the blue. DO THIS NOW...
BEEP!
Sheesh! Hope it's worth it!
Heck maybe I will copy and distribute...
How does it know if I was telling the truth anyway?
BEEP!
THIS DISK WILL SELF DISTRUCT IN FIVE SECONDS!
Please answer the following questions truthfully:
1. ARE YOU AWARE OF THE COPYRIGHT LAWS GOVERNING COMPUTER SOFTWARE?
2. WOULD YOU KNOWINGLY BUY OR SELL PIRATED SOFTWARE?
3. DO YOU INTEND TO COPY AND DISTRIBUTE THIS GAME?
CONGRATULATIONS! AND THANK YOU FOR YOUR PATIENCE IN THIS MATTER. YOU MAY NOW PLAY THE GAME.
NO!

New Improved Version

TURBO ST

By

SOFTREK

P.O. Box 5257
Winter Park, Florida 32793
(407) 657-4611

— FASTER THAN A SPEEDING BLITTER !!

- Makes your 520 / 1040 ST™ outrun a Mega ST™.
- New version supports HiRes 40 and 50 line modes.
- Makes *ALL* versions of TOS run faster.
- Only $49.95 — Less than half the cost of a hardware blitter.
- Installs automatically — just load it and forget it.
- No soldering, no copy protection, no setup — Just speed.

Turbo ST vs The Blitter (% speed increase)

	Monochrome		Color	
	Blitter	Turbo ST	Blitter	Turbo ST
dBMan 5.0	10%	59%	8%	60%
Data Manager 1.1	83	94	85	88
1ST Word 1.0	37	35	34	41
GFA BASIC 2.0	22	69	13	65
Interlink 1.8	53	63	46	71
ST BASIC 1.0	221	517	219	567
ST Writer 3.0	18	116	17	127
Word Writer 2.0	34	31	35	37

Results obtained while paging through an appropriate data file.

Ask for Turbo ST at your local dealer or send $49.95 plus $2.00 shipping and handling to SofTrek, P.O. Box 5257, Winter Park, FL 32793. Florida residents add 6% sales tax. Visa and MasterCard phone orders accepted. Call (407) 657-4611. Upgrades to version 1.4 are available for $5.00 U.S. plus your original disk. Offer expires 60 days from the date of this publication.

Turbo ST does not speed up programs that use GDOS fonts or that bypass the GEM operating system, such as PC Ditto, but is compatible with them. TOS, ST BASIC, ST Writer, 520 ST, 1040 ST, and Mega ST are trademarks or registered trademarks of Atari Corp.

Get In The Fast Lane — Buy Turbo ST Today!

Add a Generic 3.5" Double Sided Drive to Your ST

by James Lacassagne

Purpose

This document is a description of the hook-ups and modifications that I found necessary in adding a 3.5 inch double sided drive to my Atari 520 ST. It is intended solely as a guide to anyone who is interested in saving a few dollars by using an "industry standard" drive in place of the Atari SF314.

Warning

This installation seems to function properly for my system, but I cannot guarantee anything. Also, the only way that a saving will result is if a suitable power supply is already available, or can be obtained at a very low price.

Requirements

One 3.5" Double Sided Drive w/Installation kit. Cost: $130. The Unit I used was a Toshiba ND-352 which came with a multi-purpose mounting kit. BE SURE that the unit is XT compatible!! (720K, etc.)

One 5V/12V DC Regulated Power Supply (at a cost of around $25). The supply must be capable of supplying 5V.+/-5% @200 mA and 12V.+/-5% @300 mA. I saved some money here by using the same supply that I used for adding a 5 1/4 inch drive as described in numerous articles in magazines and on Bulletin Boards.

One 34-pin Card Edge Connector ($3). Yes, This is the "industry standard" used on all XT's and Clones. I got mine at Radio Shack.

One standard Atari 3.5 in Disk Drive Cable ($8). Preferably, use one of the After Market types, 6' or so in length.

One Disk Drive Case (cost ?). This is optional — I still haven't found a good cheap one, but the drive seems to work fine.

Procedure

There are two ways to proceed with this project depending on whether you want the new drive to be A or B. The Drive B method is the simpler, so I will start with it.

Cut the Standard Drive Cable in half (Save the other half for another project--maybe!). Strip back about 2" of the outer insulation from the cable. DO NOT cut off the shield wire (a layer of wire woven around the multiple conductors in the cable). Carefully unweave the shield, and twist it to form a wire of its own.

Since the 34-pin connector that I used was designed for ribbon cable, some ingenuity is required here. Each pin on the connector ends in a V shaped stud designed to separate the ribbon cable wire and cut only its insulation when the cover is forced in place. Since most of the wires in the cable go to the top row of the connector (the even-numbered pins) and the shield goes to the bottom row (along with the wires from pins 3 and 7 of the Atari connector) I divided them accordingly and routed them above and below the connector cover.

Very carefully, I pushed each wire far enough into the corresponding Vstud to hold it in place. I then forced the cover down, forcing the wires the rest of the way into the V. By trial and error I found that the two ground wires (pins 3 and 7) in the cable did not provide a sufficient ground path, causing unreliable drive operation.

I overcame this by (gasp!) tying the shield to ALL of the odd numbered pins on the connector. (That's what the twisted shield wire is used for.) Carefully lay it over the bottom row of Vstuds before putting the connector cover on. The connections follow:

(NOTE: the colors mentioned are for an Atari Cable and you should check if you are using an After Market Cable.)

Standard 34 pin	Corresp. Atari	Signal	Color
2	*	media chng	
4	N/A	in use	
6	N/A	d4 sel	
8	4	index	yellow
10	5	d0 sel	green
12	6	d1 sel	violet
14	N/A	d2 sel	
16	8	motor on	brown
18	9	direction	orange
20	10	step	grey
22	11	wrt data	pink
24	12	wrt gate	lt. blue
26	13	track 0	lt. brown
28	14	wrt prot	lt. green
30	1	read data	red
32	2	side 0	white
34	*	rdy/med ch	
(any	3	logic gnd	blue
odd)	7	logic gnd	black

Assemble the Disk Drive and Adapter kit. It should have come with a power cable adapter with a std XT connector on the end. You can either buy a mating connector or cut it off and splice directly to the wires. (Generally, pin 1 (red) is 5V, pin 4 (yel) is 12V, and pins 2 & 3 (blk) are Ground.) The Installation Kit may refer to a jumper on pin 34, but this can be ignored.

Now, the only modification to the drive can be made. On the Installation Kit PC Board, a Jumper must be soldered between pin 2 and pin 28 of the Drive Connector. (This is the one that actually connects to the Disk Drive. It is identical in pin layout to the Std connector, with pin 2 on the top left as you look at it.)

This connects the Media Change signal on pin 2 to the Write Protect signal. (Thanks to Analog2 for pointing me in the right direction on this one.) These are both open-collector, active low signals, and can be safely wired together.

This should be all that has to be done to make the drive work. Simply plug the cable into the OUT connector of the first drive or the 1040, and away you go.

If you have a 520 and want this to be drive A, the procedure is the same, except DO NOT CUT THE CABLE IN HALF. Instead, strip a 3-4 in. section in the center of the cable, cut and unweave 1/2 of the shield.

Lead the wires over the Vstuds as before, but cut the wires from the Atari connector pins 5 & 6 (computer end). Pin 5 wire is connected to the Std connector pin 10 and pin 6 wire is connected to the remaining end of pin 5. (The part that will go to the second drive.) This brings the ds1 signal to the ds0 pin on the second drive, just like Atari does it. You can cut off the remaining pin 6 wire if you like, since it doesn't get used. Don't forget to attach the shield to the odd number connector pins.

If you have understood and followed my directions, the drive should function properly. If not, there is not much that can cause damage. My version will read and format and write double and single sided disks without any problems. If you encounter any difficulty, I can be contacted through Delphi as JIMSL or CompuServe No. 72257,1613.

Atari, Radio Shack, and Toshiba are Registered Trademarks.

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Atari Interface Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

Fishin' Around by Brent Fisher

Ladies and Gentlemen, Trolls and Tramps, Cross-eyed Mosquitos and Bull-legged Ants. I always wanted an excuse to use that phrase. Anyway on with the news. We have finally gotten a copy of the new DOS XE from Atari. I had originally received the manual but the disk, it seems, slipped out of the envelope as it was about to be shipped to us. Atari enclosed a letter with the manual that stated that the club's copy (the one that I am referring to) may be freely distributed to the club members. The only drawback of this is that the manual is a great help when it comes to figuring out how to use this DOS. Atari must have figured on this also since they stated that if anyone wished to receive the manual and the disk those persons could send Atari $10 plus another $3.50 for shipping and handling. If anyone would like the address, please contact me. Now I have to admit that this is probably not a bad deal; the only thing I don't like is the fact that XF551 owners have to also send in money for a DOS that they where supposed to have received with their disk drives. Well I suppose that I have ranted and raved enough for this month, so on to other things.

We had a relatively good turn out at the meeting last month, even a couple of new members showed up. We did not unfortunately have the proposed MIDI maze competition as was thought, but all in all I still think that we had fun. I can't wait to see if the 8bit version of MIDI maze comes out, but I have also seen how development for the 8bit has been going the past few years. So all that I will say is don't hold your breath. Since more ST users have been joining the group recently, perhaps we can again have an ST public domain library though of course that all depends on the reaction of those members who are interested.

On another note if anyone has an 8bit disk drive or a modem that they are not using please contact the club as we would like to talk to you.

Well I would like to think that my column this month is not quite as ragged as last month's, of course I also gave myself a little more time this month too. One final note from my thoughts for this month. The March meeting will take place on the 12th which is a Sunday and the time in which we will be there will be between the hour of 1pm to approximately 4pm. I hope to see you all there.

Treasurer's Report by Craig Schaff

First things first, I would like to welcome all of our new members: Jason Steffes William Freiberger Ken Mehi

A message and reminder, if you are receiving AIM and your dues expire, you will receive the CACE newsletter until your dues are renewed or until two months has passed. If you are receiving the CACE Newsletter, you'll receive it for two month after the expiration date on your mailing label. Your expiration date is on the upper right corner of the mailing label for both AIM and the CACE newsletter. If your date has been circled in RED, it means that your dues has expired and that it may be your last issue.

If you would like to renew your membership in CACE and receive the Atari Interface Magazine, you may send a check or money order to the club at the above address or you can pay at the club meeting. Club dues are $14.80 per year with the AIM magazine. You may renew at any time, even if you still have a while to go on your current membership.

If you haven't heard, your club has a "bulletin board" up and running. You may call any time, as it is open and operating 24hrs a day, seven days a week. There is no charge at all, and if you mention that you are a club member, your time on-line will be upped to 45 minutes! The BBS is open to all computer types with a modem. If you don't have a modem, borrow a friend's or use a friend's system! There is Electronic Mail messages called E-Mail, that will send and receive messages to and from other members of the BBS. There is a General topic board that you can join in on on going conversations of any topic, and if you need help or have a tip that needs asking/answering you can leave it here on the General Topic board. There is a FOR SALE board, If you have ANYTHING that you want to sell, or you are looking for that one certain item, leave a message on the FOR SALE board. Also there is a CACE members only board, if you are a CURRENT member of the CACE club, you'll have access to this board. In it you'll find information about upcoming meetings as well as highlights from past meetings. Plus you'll hear it here first about the up-coming picnic, trade fairs and shows. The Bulletin Board (BBS) also allows uploading and downloading programs and files for ATARI 8bits only (sorry, but for now the disk drive that handles the files is on the fritz, no up/downloading as of yet). The Phone number for the CACE BBS is 787-4011. It makes no difference if you have a 300 or 1200 baud modem, it'll handle it.

Well my space is up, I'll see ya at the meeting or on the board. bye!!!

CAPITOL HILL ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. The meetings take place at the MSU Physics-Astronomy Building, Physics Road, Room 118. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them. To get to a meeting, take East Grand River to the Collingwood Entrance for MSU. The first available left turn is Physics Rd. The Physics-Astronomy Building is about 1 block from the corner, on the right hand side. Park in the gated lot just past the building.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

President's Corner by Leo Sell

This month marks our first with the new relationship we have with AIM. In keeping with our belief that our club and club members are best served by a club controlled and owned newsletter, we are now publishing our own newsletter as well as participating in AIM. Yes, you heard right. We will be continuing a limited relationship with AIM. I'd like to thank Unicorn Publications for the opportunity to participate in this way and get the best possible subscription rate for our members.

It's certainly going to be a challenge not to repeat myself too much in writing three columns. Actually it's inevitable, so I hope you'll forgive me. It looks like a busy spring and summer coming up. We will be participating in (and needing help with) most of the following computer shows:

MAXIT — The spring Computer Show, sponsored by the Michigan Computer Consortium. MAXIT will be April 9 at the Clarion on South Cedar.

Atari Expo — MACE, one of our sister Atari User groups, has scheduled an AtariFest for May 6 and 7. As of this writing, we have received no information about club participation, but assuming everything works out, we'll likely be there.

World of Atari — This show, sponsored by ST World magazine, is taking place at the Hyatt Regency, Dearborn on June 24 and 25. Atari Corporation, as well as other big names in Atari computing, will be there. Based on what I've heard, this should be a real high quality event. We're waiting for details on club participation, but I certainly intend to attend.

Hope this finds you well. Happy computing.

GENESEE ATARI GROUP

Serving the Flint area

President's Report by Jerry Cross

Lots of things happening in the next few months. This month you will be receiving two newsletters. AIM, and a new publication that is jointly put out by CHAOS and GAG. More information on this will be given out in a special mailing this month.

We are looking for volunteers to help out in a few shows coming up in the next few months. If you can help out in any way notify one of the club officers. These shows include "The World of Atari" in June, an AtariFest put on by MACE, and a few computer swap-n-shops during the summer. It's important for Atari clubs to be represented in these shows to let folks know Atari is still around and where users can go to for help and support.

Also, just a reminder for those who can't attend the monthly meetings. GAG disks are available from Discount Computers on Corunna Road. They are open 7 days a week, and this makes it very conveniant for you to get the disks you want. Thanks to Lou Stones' help, we have signed up several new members through his store, and have sold a lot of disks.

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Inc.

GAG meets on the second Wednesday of the month at Neithercutt School, located at 2818 Crestbrook Drive, Flint. Meetings begin at 6:30 pm. All are welcome. GAG membership includes a monthly newsletter, access to our growing magazine library, and public domain disks.

Membership: $15 yr.
For Information contact:

Great Lakes Atari ST Support

'GLASS', Michigans only 'ST' only Users Group

I ♥ my ST!

Meetings - First Thrusday every month, 6 p.m. to 9:30 p.m., Athens High School, 4333 John R, Troy, Mi., 1/10 north of Wattles <17 Mile> - Room 1528 - Mailing Address - P.O. Box 99737, Troy, Mi. 48098 Phone - (313) 828-1653 after 4 p.m. - Steve Mileski, president

Dues - $1.00 per month, ie:join in April - pay $9.00, all memberships expire on January 1, each year. Non-members welcome at no charge.

From The Desk Of The President...February 6, 1989

NOTE Would the person who called and left a message on my answering machine inquiring into how to join GLASS please forgive me for not returning your call? You see, you forgot to leave your name or number, so I wasn't able to. Please call again!

This year is going to be interesting for GLASS, the Atari community, the Atari Corp, various Atari publications, the Atari hardware and software developers, and YOU...the Atari user!

Atari Corporation...is promising stronger communication and support for the user groups. We did receive a package containing containing a DOS-XE Master Diskette (5 1/4 disk) and an Atari DOS-XE:XF551 disk drive manual, and some "I LOVE (heart) ATARI" bumper stickers. There was no cover letter explaining this wonderful gift. Atari seems oblivious to the fact that we are an avowed 'ST' user group. If any of you members also have a use, need, or desire for the DOS-XE Manual and Disk they will be given to the first member that contacts me.

At the last General Meeting the following items were given away; ST joystick port extender cables (to Jerry Majeski), Cross Town Crazy 8's, the game (to Joe Gumbleton), and the February 1989 issue of START Magazine with disk (to Fred Wixon). The following peoples numbers were selected but did not receive the gifts because they were not here; Richard Melmine, JoAnn Roth, Jackie Appleton, and Myron Bell. Remember! There is no cost for the give-away, all you have to do to be eligible to win is be a paid member and be here!

The Atari publications, START, ST-Informer, ST-World, and others, continue to bring us excellent information, reviews, news, and opinions. Thanks guys, you're doing a fine job!

You should get the February 1989 issue of Radio-Electronics. Inside, in a section called Computer Digest, there is a glowing review of the Atari ST line. Regarding a new kid on the block, I'd like to mention the Atari Interface Magazine or AIM. Of course, we all know that this is the replacement for the Michigan Atari Magazine from Unicorn Publications and that it has retained the original flavor and content. Several Michigan user groups besides GLASS currently use AIM as their club journal.

The Atari ST user has become more knowledgeable about their computer and the myriad of things that can be done with it, whether it's Word Processing, Desk Top Publishing, Midi-Music, Art work (graphics), Data-Basing, Telecommunications, Educational Programs, or Financial Planning. In spite of some of the 'gloom & doom' feelings that abound regarding the future of the Atari computer line I can say that I LOVE MY ATARI ST!

The GLASS users group is growing. By the end of the February meeting we have a total of 42 active 1989 members. Considering that we started out on January 1 with zero this is a good sign of the strong approval of GLASS by it's members. New members include Mike Cornwell of Roseville, Chuck Masek of Sterling Hts., and Dennis Thornton of Rochester Hills. We welcome you to GLASS and hope to see you every month, because it's at the General Meeting where everything happens. The following members re-joined this month Thomas Heiden of Warren, Jack Flegg of Fraser, and Rich Schneider of New Baltimore. Welcome back! I would like to acknowledge that many of our members drive 30 miles or more to attend the meetings, so we must be doing something right.

This month I would like to introduce you to GLASS member Neron Nesmith. Neron and his wife Judy, live in Livonia (quite a way to come to a user group meeting) and he works for a Brighton firm called ESP (for Electronic Personnel Services) and is currently attached to the Cadillac Group of Dearborn. Byron originally hails from Dearborn Hts.. In his early 30's, he finds a certain fascination for the Atari ST. First getting his ST to help him write term papers and the like for college classes, he soon discovered an interest in it's musical abilities. His hobbies are electronics tinkering and ST computing.

When asked to make a statement about the Atari ST his reply was, "I continue to be in a state of amazement about the quality of the professional software available for the ST. It's some of the most powerful, sophisticated, and yet user friendly programming I've ever seen!" When asked what some of his personal software favorites were he had trouble deciding between Universal Item Selector II, Multi-Desk, and the Mavis Beacon Typing Tutor.

His opinion about GLASS is that it is "Fun, friendly, and refreshing in it's approach to it's members." He liked us enough to accept the position of Executive Secretary for 1989. Neron, welcome aboard! Your involvement and high praise for GLASS is appreciated and we hope you continue to enjoy our company! And to Mrs. Nesmith (Judy) we say "Thank you" for sharing Neron with us.

Steve Mileski

President's Monthly: 17 February 1989

Well, this month I have good news, and I have bad news. First, the bad news is that our Spring Atari Fair has been postponed. It appears that it will be held this fall with the inclusion of other computer clubs (Apple, IBM, and Commodore). More later as the details get worked out.

The good news is that the SpartaDOS Construction Sets have arrived and will be passed out at the March meeting. If you ordered one and did not come to the meeting, thank you, I'll put it to good use. Just kidding, contact me, and we'll get yours to you.

The past couple weeks have found me working with SpartaDOS, And I personally feel it is the best Disk Operating System available for the 8bit Atari, at any price. Once I got a little familiar with the commands and the use of sub-directories and batch files, it was easy to do most any type of disk task with ease. It is also very simular to the MS-Dos system that a lot of us use at work. It is comforting to know that you no longer need to know how to use two 'different' operating systems. With SpartaDOS and a few Public Domain and Shareware programs, anyone should be able to perform all the tasks they wish, and at a very reasonable price tag. ICD has a fantastic product here. If you do not already have SpartaDOS, and you do a lot of disk work, you should consider it.

A new addition to the meeting this month is the electronic questionaire. With it I hope to get insight into the needs and thoughts of the members. I also suggest that newer members use it to ask those questions that they are to shy to ask at the meeting. Terry Reine will also use it to update the member hardware list, and possibly add a user software list for those who need info on a piece of software they plan to purchase. Let's all use this new tool to it's fullest, and help other members get the information they deserve.

The little Calculator is coming to an end this month. Gary Heitz has done a nice job adding functions and explaining how they are programed. Next month we start a new project which will be decided at the March meeting. Thanx Gary, we have all been learning.

Still no word on the Diamond Operating System we ordered. If anyone can help us to procure one, please give me a call. I'm very excited about the new O.S. modifications, and would like to see a couple of them demoed before I make a choice of which one is for me.

Dues are due!! If you missed the March meeting, be sure to send them to George Nosky so you don't miss a single issue of AIM. If you don't join or rejoin, you could miss the best year yet. Dues are still just $22.00 a year, including the AIM subscription.

Lastly, I would like to thank Gerry Borysiak for his wholehearted effort toward the Atari fair. I'm sorry it did not work out with all he has done to get it set up. Thanx Gerry!

See you at the April Meeting! Good computing, Tim

M.A.C.E. M.A.C.E.

MACE

MICHIGAN-ATARI-COMPUTER-ENTHUSIASTS

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)
MACE East	(313)978-1685	(3/1200)
The College Board	(313)478-9647	(3/12/2400)
DownRiver Outpost	(313)675-4660	(3/12/2400)
Molin's Den	(313)420-0407	(3/1200)

Atari Expo Update

If you weren't at the February General Meeting of MACE, you missed out on getting the latest news about the Michigan Atari Computer Expo. I thought I'd fill you in on some of the more important details!

As you know, the Expo is scheduled for May 6&7, at the Detroit Metro Airport Hilton, located in Romulus. The show times are 10 a.m. to 6 p.m. on Saturday, and 10 a.m. to 5 p.m. on Sunday. Ticket prices to non-User Group members are $5, and children under 12 get in free of charge.

The Exhibitor Kits were mailed on February 1, and already (as of Feb. 20th) we've got half of our booths committed for by large and small developers. Some names you may recognize are ICD, Migraph, Alpha Systems, Innovative Concepts, SofTrek, USA Media, Gribnif Software, BEST Electronics, ST Informer, Index Legalis, Mars Merchandising, Astra Systems, Total Control Systems and others! Some of the local dealers coming to the Expo include Rite Way, Computer Concepts, Joppa Computers and Basic Bits 'N' Bytes, just to name a few. The list of names increases weekly as "maybes" become "yeses!"

User Groups will be able to obtain booths free of charge near the ticket sales, and User Groups members will be able to obtain discounts from any vendors participating in the User Group Discount program. This discount would be above and beyond any special show prices! If you'd like to help at the Expo by "guarding" a door, taking tickets or other odd jobs, you would be eligible for the Gold Card Program. For more information on this, please call me at (313) 973-8825.

A few people have expressed the feeling that the show ST World is working on in June was in the works before MACE thought of having a show, and we're being greedy or stubborn to butt heads with this other show. Nothing could be farther from the truth.

MACE has been working with Atari Corp (Sig Hartmann and Cindy Claveran to be specific) since the end of September when Sig Hartmann called and spoke to Bill. I had the unhappy task of informing Atari of this "competing" show as they didn't know ST World had anything planned for this area.

It wasn't until January that ST World had a date and hotel set for their show, by which time we had already begun organizing the Exhibitor Kits to send to developers. By the end of October, we had set the date for the Show with both the Hilton and Atari, plus contacting developers to let them know what was in the works. Discussion of the show was held at the November General Meeting, the minutes of which appear in the December issue of MAM.

We've got the word out to developers, User Groups and attendees alike with our announcements in publications like Analog, ST Log, ST X-press, ST Informer and the Griffin Gazette (not to mention AIM!). A press release has also been posted on GEnie, CompuServe, Delphi, MACE WeST and East and the Treasure CheST, and the same press release appeared in a recent ST Report.

On another note...if you need to renew, please do so, and my thanks go to those members who have just committed to MACE for another year (or more in some cases)! If you're not sure when you need to renew, please check the label on this magazine or catch me at our General Meetings.

Pattie Snyder-Rayl

PS. The February Meeting Minutes weren't available for publication because the General Meeting was after the deadline. They will appear in the April issue.

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the second Saturday of every month at 2 p.m. at the Rudy Zauel Memorial Library on the corner of Shattuck and Center in Saginaw. Upcoming meetings are scheduled as follows: March 18 and April 15, 1989.

LeRoy Valley	President	686-6796
Marty Schmidt	Treasurer/Secretary	792-6029
Al Jennings	ST Disk Librarian	790-1980
Ted Beauchamp	8bit Librarian	686-8872

Club dues are $20.00 per year. For this fee you get the Atari Interface Magazine, support for both the 8bits and ST's, and full access to the clubs public domain library. We currently have 150 8bit disks and 50 ST disks. 8bit disks cost $1 each, and ST disks cost $2 each. Check your mailing label. If you need to renew or you haven't even joined yet, then do it now!

Washtenaw Atari Users Group -- February 14th, 1989

President Jon Brode's variation on "Hear yea, hear yea" brought the crowd (about 15 people) to order at 7:45 p.m. The meeting was held at State Street Computer. Jon noted there was no pressing club business and the feature topic as "Utilities."

ST Librarian Russ Crum described the contents of the special disk he put together for this meeting, including the latest version of ARC Shell (now up to v1.97c), Mouse-ka-mania, DC Formatter v3.0, and DCopy v3.07. Russ also announced a new update to the catalog disk, and reminded members they could get the update for free by returning a previous copy of the catalog disk.

8Bit Librarian Mike Millage announced his disk special included a repeat of last month's SuperARC, DiskCom3, some speedup utilities for the XF551, and that he would be demonstrating these along with DOS XE, the long-awaited Double-Side, Double Density DOS package from Atari.

Mike Olin demonstrated the use of ARC Shell, in combination with DCopy. Mike also showed Mouse Double (a speedup utility for ST mouse operations), SuperBoot (a utility that allows the user to define which programs run in the AUTO folder, which Accessory files will load, and select from multiple DeskTop Info files) and the AUTOFOLD.PRG from the Michtron Utilities Plus disk (which allows the user to reorder the files that appear in an AUTO folder.)

Upcoming meetings: March 14 - Databases

April 11 - Printers

May 9 - Education

June 13 - Elections/Flea Market

Meetings begin at 7:30 p.m. The next meeting will be at State Street Computer in Ann Arbor.

Ask Tim

by Tim Sharpe

Q Every now and then my 1050 Disk Drive stops dead in its tracks, sits idle for a few seconds, and then starts running again. I was told by some friends that you never give good advice and that you just make up your answers as you go along. But I'll trust you on this one. What's making my drive behave like this?

A I was almost tempted to just throw your insulting letter away, but I've decided to answer your question to prove once and for all that I do NOT "make up answers as I go along."

Your problem is a simple one. It has to do with the ATARI Operating System (OS). The OS contains a "time-out" feature which causes devices to quit working--yeah, that's the ticket. The time-out feature allows devices hooked up to your ATARI to temporarily stop working so they can enjoy a coffee break--yeah, that's the ticket. This ability was programmed into the OS to allow extra-terrestrials to write coded messages onto the diskette during this coffee break--yeah, that's the ticket. They have to do this because everyone knows that our government won't tell us anything--yeah, that's the ticket...

Q I've recently heard a rumor that the large state of Texas is going to be split into to smaller, equal states. One will be called "Old Texas" and the other will be called "New Texas." Is there any truth to this rumor?

A Hey, read my lips: No New Texas!

Q Hello. I'm sure that the first time you read this letter you will assume that it is a practical joke. I assure you that it isn't. I am writing to you from the future: specifically, the year 2200 A.D. As you can see, the U.S. Postal Service has gotten much better at delivering mail (but the cost of the postage stamp was outrageous!) I discovered your existence from a copy of a magazine that was found in a time capsule. It's being displayed in an ATARI museum, and although I can't remember the name of the magazine (I think it sounded like a brand of toothpaste), I did manage to get your address. I've got a degree in Computer History, and I just wanted to let you know that ATARI went bankrupt in the year 2001 A.D. It seems ATARI had two major problems that they could not overcome: lack of advertising and not coming through on products that it promised to release. In 1999 they advertised heavily in the small farming communities of Cornville, Iowa and Wheatville, Kansas; but, alas, national sales did not rise. Was it common practice in your time for computer companies to advertise only in small communities?

A Don't act so surprised, ATARI users—we all KNEW this would happen some day, didn't we?

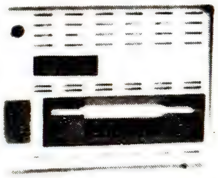
Astra gives up !!!

No we are not going out of business...
We are going out for business !!!

The demise of many Atari dealers, and the reluctance of many more to carry much inventory forces us to announce:

Astra Systems goes Factory Direct !



SYSTEM HD+

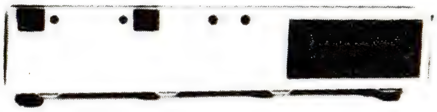
Our original offering for the ST computers is now available in 20, 30, and 40 megabyte capacities. With precision double sided 3 1/2" microfloppy and its tough construction it ranks as the one to beat.

SYSTEM HD+ 20	$849.95
SYSTEM HD+ 30	$919.95
SYSTEM HD+ 40	$1069.95

RM 60/120 & RM 80/160

Our rack mount units for the MIDI musician fit portable and permanent racks.

RM 60	$1295.00
RM 60/120	$2095.00
RM 80	$1995.00
RM 80/160	$3495.00
EXPANSION 60	$ 875.00
EXPANSION 80	$1595.00



THE EXPANDER

A truly expandable hard disk system. Not a chainable one as many competitors are offering. Contains space, cooling, and sufficient power supply to handle up to 120 megabytes of storage inside the under-monitor case. Built-in surge protection for its 4 AC outlets. Controls the CPU and peripherals from the front of the unit. Optional precision double sided 3 1/2" microfloppy. Twenty, thirty, and forty meg units.

EXPANDER 20	$759.95
EXPANDER 30	$819.95
EXPANDER 40	$999.00

TOTAL CONTROL SYSTEMS

GOE™

GRAPHIC OPERATING ENVIRONMENT

TOTAL CONTROL SYSTEMS is proud to announce the arrival of the very latest in 8 bit software, a true GRAPHIC OPERATING ENVIRONMENT.

Don't be fooled by cheap imitations! Don't be misled by advertised promises! It's time for your 8 bit to get up and GOE!

GOE is a complete desktop interface for the Atari 8 bit which ties up only 8k of memory for a 64k program - using the GOE cartridge! GOE supports icons, drop down/pop up menus, resizable/slidable/movable windows, control panel/calculator/notepad desk accessories, numerous mouse controllers, various font styles/sizes, and uses Atari help/console keys.......all this and externally programmable, too!

GOE doesn't stop there! GOE supports redefinable disk/file icons, comment storage for each disk/each file, time/date stamping, directory sorting, and........all popular DOS's including SpartaDOS II/X, Atari DOS II, and the new Atari DOS XE.

GOE includes complete programming information and a disk with Atari BASIC, Action! and Mac65 examples.

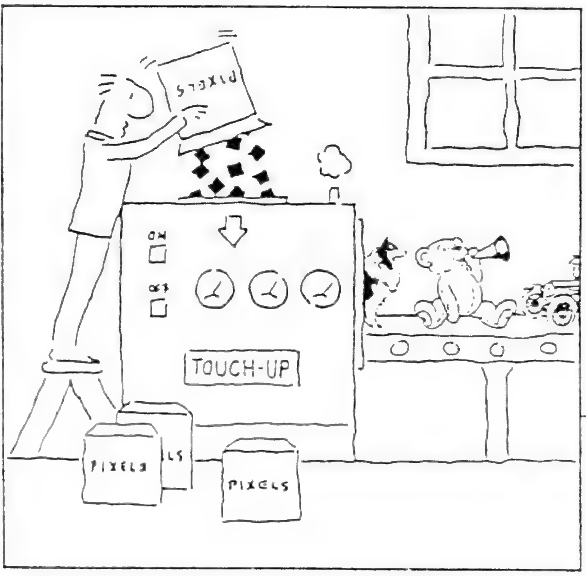
Give your desktop graphics that professional touch.

Introducing Migraph Touch·Up™



Migraph Touch-Up is the complete design tool for high-resolution monochrome images.

Create, edit, enhance—you can do it all with Touch-Up.

And do it better, because Touch-Up is the first "virtual page" graphics program for the Atari ST.* A sizeable advantage indeed!

Touch-Up can handle bit-mapped images of any size and resolution (based on available memory in your computer). Which means you can now produce pixel-perfect images for all your publishing projects.

Migraph Touch-Up. A powerful tool for professional-quality results.

Ask your dealer for a demonstration of Touch-Up, or call Migraph's toll-free number for more details.

MIGRAPH.

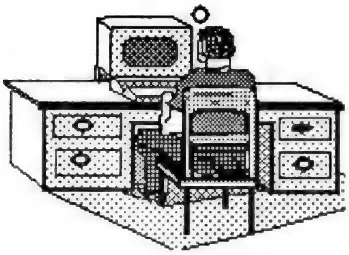
AIM is produced on a 2.5 meg Atari ST, HP LaserJet II, Timeworks' Publisher ST and PageStream

Atari Interface Magazine is a monthly magazine that also serves as the official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. A subscription to AIM is included in membership in any participating club or may be purchased directly from Unicorn Publications. For advertising or user group discount subscription rates, please call (313) 973-8825.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable). Opinions expressed within articles in AIM are solely the views and responsibility of the authors and do not necessarily represent the opinions of AIM or of any participating group. Atari, the Fuji symbol and names of various Atari computer products are trademarks of Atari Corp.



Editorial Ramblings

Welcome to the April issue of Atari Interface Magazine. Things have been pretty upbeat around here in the past month!

With the plethora of Atari-oriented shows coming up this month and in the months ahead, Atari users across the country should get quite a boost. All of us in the Atari community benefit when the general public gets a chance to see what these great machines can do!

This month also brings a new participating club to Atari Interface Magazine. The Tinker Atari Computer Enthusiasts of Moore, Oklahoma is the first non-Michigan user group to become a participant in the magazine. In the past, TACE had been part of Puget Sound Atari News (PSAN), the excellent cooperative publication out of Seattle, Washington. Welcome aboard, TACE!

We're also in the midst of "playing around" with a new program under development by Bob Retelle. His program takes a Degas color picture and performs a color separation on the picture. Basically, if the process gives high enough quality, Bob's program will allow us to have "full-color" covers at a very reasonable price. In fact, if our little experiment turns out well, this issue of AIM may be our first full-color cover. If not, then it's back to the separating board (after all, someone already did the drawing) for a few minor touches. We won't know how the full-color test looks until we take the rest of the issue up to the printer. Fingers crossed...

The theme for this issue is "Utilities." This issue contains reviews of some of the very best commercially available utility programs for the ST, including MultiDesk, SolaPak. Turbo ST and G+Plus. Also in this issue is a review of "The Atari ST Book" by Ralph Turner, a highly recommended book for all ST owners.

For all you 8bit owners, we have a special treat. If you haven't been living in Siberia for the past couple years, you've probably heard of Bob Puff. One of the most well-known 8bit programmers to appear in recent years, Bob Puff has been involved in such projects as MyDos, DiskCommunicator, SuperArc and SuperUnArc. In this issue, Mr. Puff gives us a behind-the-scenes look at the making of DiskCommunicator and SuperArc and UnArc.

All this, and much more, awaits you inside...including the "Checkout Chatter" insert from Gordon Totty of MACE. Don't look for this one at your local grocer...you can only get this April Fools' treat from us!

See you next month.

Bill & Pattie Rayl

From the Reader's Viewpoint

I am finding it very disturbing that many of the people who should be actively involved in pursuing the enjoyment of Atari computer products are, in fact, at odds about the upcoming Atari shows. It absolutely amazes me that people who should be happy about having an Atari show in the Midwest (and overjoyed there will be two!) are digging in the dirt to find something/anything minuscule which can be turned into a mountain.

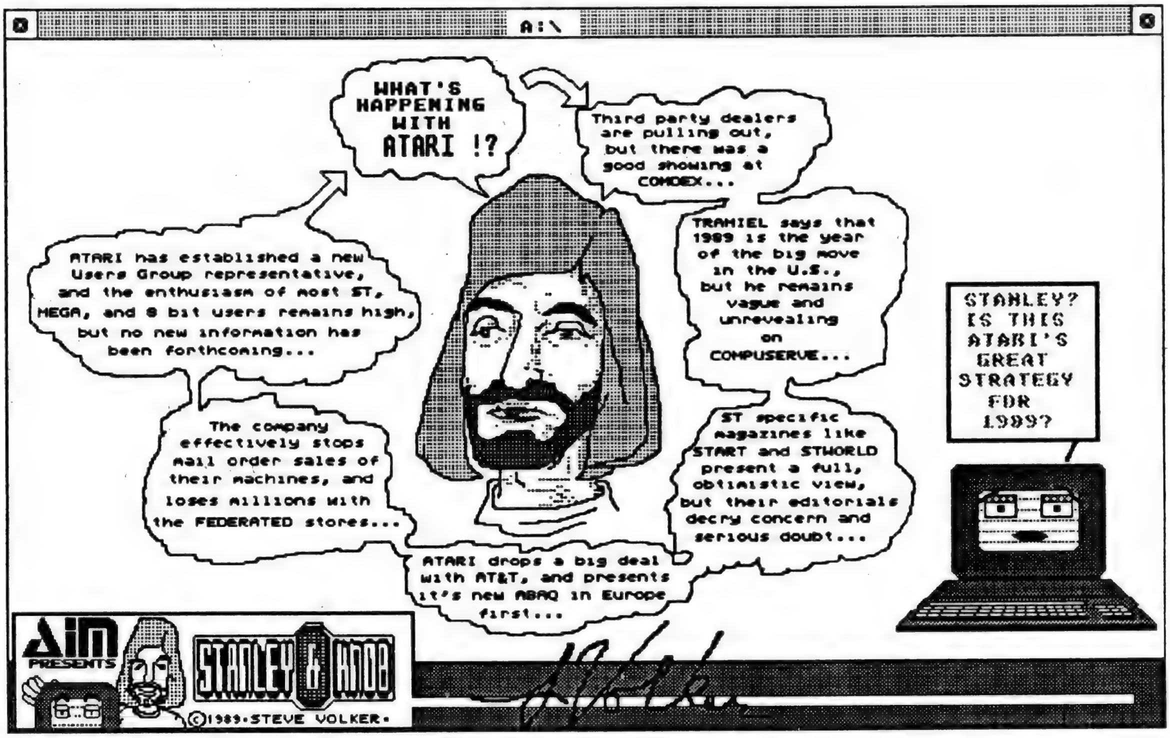
Just what the hell is wrong with having two shows in Spring '89???

It seems that Atari is going to support both shows, it seems that Atari will be attending both shows, and it seems there is going to be plenty of vendor support for each. So why must there be so much animosity? Isn't it about time the members of the Michigan Atari Community pulled together instead of trying to pull someone else down? Isn't it about time the Atari User Groups in Michigan started living up to their charters and constitutions? Isn't it about time the swords and daggers were put away and replaced with the tools of building? Aren't we all in it for the same reason: for the greater enjoyment of our investment in excellence?

Frankly, it makes me sick to see so much back stabbing going on just when we are finally beginning to see some positive forward steps in Atari product support from the manufacturer. Each and every one of us has screamed for this day. Each and every Atari owner, developer, and vendor has everything to gain from these endeavors.

C'mon people, WAKE UP! If you can't see that having two shows is like having your cake and eating it too, then I submit you have your eyes closed. Rather than finding fault with every decision that has to be made, find it in your enthusiasm for Atari computers to HELP, not hinder. It is not hard to figure out that if you're not part of the solution, you're part of the problem.

Michael Olin, WAUG Officer, MACE Officer, Concerned Atarian



A:\
WHAT'S HAPPENING WITH ATARI !?
Third party dealers are pulling out, but there was a good showing at COMDEX...
TRAMIEL says that 1989 is the year of the big move in the U.S., but he remains vague and unrevealing on COMPUSERVE...
ATARI has established a new Users Group representative, and the enthusiasm of most ST, MEGA, and 8 bit users remains high, but no new information has been forthcoming...
The company effectively stops mail order sales of their machines, and loses millions with the FEDERATED stores...
ST specific magazines like START and STWORLD present a full, obtimistic view, but their editorials decry concern and serious doubt...
ATARI drops a big deal with AT&T, and presents it's new ABAQ in Europe first...
STANLEY? IS THIS ATARI'S GREAT STRATEGY FOR 1989?

Atari News and Comment

by Bill and Pattie Rayl

With only a few days before COMDEX, to be held in Chicago on April 10-14, Atari Corp. has remained relatively quiet as to what, if any, presence they will have at the show. In a letter sent to a number of user groups across the country, Sig Hartmann mentions that Atari will be at COMDEX. At the time of this writing, Atari has publicly made no statements such as those heard about last Fall COMDEX.

Atari Shows

Just over a week later, the Anaheim World of Atari Show, sponsored by ST World magazine is generating much more enthusiastic commentary from Atari employees and spokespersons. Showcasing the entire line of Atari products, the show promises to be an event to remember. Seminars and in-depth Workshops are planned, and Fleetwood Mac is scheduled to appear, showing off the MIDI capabilities of the ST.

The Anaheim show will be held on April 22 and 23. Admission is $5 for one day or $7 for both days, children under 12 admitted FREE. Specials are available on tickets to Disneyland and other area attractions. For more information, call (503) 673-2259.

On May 6 and 7, "high management from Atari" will be attending the Michigan Atari Computer Expo, to be held at the Detroit Metro Airport Hilton in Romulus, Michigan.

The two-day event, sponsored by the MACE user group, will feature over 30 exhibitors including WordPerfect Corp., ICD, Migraph, Alpha Systems and others. Planned seminars include drop-ins by DataQue's Chuck Steinman who will be showing off their Turbo-816 8bit hardware upgrade and Darek Mihocka, who has announced that the FINAL version of his ST Xformer will debut at the Expo.

One special feature of the show is the User Group Discount Program, giving extra discounts to attendees with proof of user group membership.

Admission for the show is $5 for both days, children under 12 admitted FREE. Advance tickets are available from some Michigan, Ohio and Illinois user groups or directly from MACE for $4. For more information, call (313) 973-8825.

Atari Corp. will then be hopping a few miles over to Dearborn, Michigan for the Detroit World of Atari show, to be held at the Dearborn Hyatt Regency on June 24 and 25. Though online reports state the Detroit World of Atari show may not have all the attraction slated for the Anaheim show, all indications are that this will one great show.

Amid conjecture from some sources concerning the close proximity of two Atari-specific shows not quite two months apart, Sig Hartmann of Atari has stated that Atari representatives will attend both Michigan shows. User groups and dealers in the state will benefit greatly from the exposure these shows will bring.

At this time, no firm dates have been set for future World of Atari shows, though plans are in the works for other shows across the country.

Cindy Claveran Leaves Atari

In a conversation with Cindy Claveran on Monday, March 20, Cindy indicated that she would no longer be working for Atari Corp. by the week's end. With about 7 and-a-half years at Atari, Cindy indicated that moving on was "not going to be easy." Cindy was Atari's developer contact for a number of years and recently held the position of User Group Coordinator for Atari.

In all of our contacts with Cindy, we always found her to be helpful and very supportive of Atari and Atari user groups. We will all miss her.

Emulators, emulators,emulators

As mentioned above, Darek Mihocka's ST Xformer is nearing its FINAL update. The Atari 8bit emulator for the ST will have full modem support and a few other, as yet unannounced enhancements. For more information on the Xformer, contact Darek at Box 2624 Station B, Kitchener, Ontario, Canada N2H 6N2.

The "*//* in an ST" Apple *//e* emulator mentioned in last month's issue seems to have died an early death. Reports are that Apple has stepped in and put a stop to the whole project.

On the Macintosh emulation front, reports are that Gadgets by Small is nearing release of their GCR hardware to be used with the Spectre 128 cartridge. The GCR will allow for FULL SPEED direct reading of and writing to Macintosh formatted disks. For more information, call (303) 791-6098.

The Atari ST has yet another emulator to add to its already impressive list. The Sinclair QL emulator, available currently only in Europe for about L200 (pounds sterling), or about $350.

For those of you unfamiliar with the QL, it was "the first inexpensive 680000 family-based home computer." Popular in Great Britain, the machine supported full multi-tasking and built-in networking hardware/firmware. Production of the QL ceased when Amstrad bought the computer division of Sinclair Research Ltd. back in 1986, but the machine retains much of its popularity. There is even a QL compatible machine available from West Germany called the Thor XVI.

The QL emulator on the ST consists of two disks and a board containing a QL video chip and some other necessary hardware. Installation of the board is as easy as removing the ST video chip, plugging in the QL board and inserting the ST video chip into the supplied socket on the QL board.

Similar to other emulators for the ST, you must supply your own copy of the QL ROMs to make the emulator work. This will probably be the biggest stumbling block to the QL emulator gaining much of a following here in the U.S. market. The emulator reported functions at nearly twice the speed of the QL and will directly read and write QL formatted disks with no drive modifications. Even the multi-tasking works perfectly!

For more information on the ST QL emulator, contact Strong Computer Systems, Bryn Cottage, Peniel, Carmarthen, Dyfed, Wales, United Kingdom SA32 7DJ, Phone: (0267)231246.

Tetris Released for the ST

Spectrum Holobyte has released yet another game into the ST market, this time the highly popular Tetris, already available on a number of computer systems and game machines. The first arcade game to reach The West from the Soviet Union, Tetris is a simple but colorful strategy game that will be a hit with youngsters of all ages. Look for Tetris at your local dealer or contact Spectrum Holobyte at (415) 522-3584.

Regent Software News

Regent Software, makers of the popular Regent Word II wordprocessor and Regent Base and The Informer database programs has a couple products hitting the market. In a post on CompuServe, Frank Cohen announced the Regent Word Student Editor, a wordprocessor that is "easier to use than Word Writer and has a better dictionary." At only $24.95, this one will fit easily into the budget of even the stingiest accounting students!

Of even greater import to all wordprocessing fans, Regent Word III is nearly finished. Programmed by William Robinson (of AtariWriter fame and currently working on projects for CinemaWare as well), Regent Word III will allow direct use of GDOS and Macintosh format fonts, as well as importation of IFF graphics. With a projected price of between $79 and $99, Regent Word III should make a big splash when it hits the market.

That's about it for this month. For those of you attending the MACE Expo, see you there (Unicorn Publications will have a booth at the show). Until next month...

Developing an Atari Show
The Michigan Atari Computer Expo

by Pattie Snyder-Rayl (MACE)

Way back in September, after just being re-elected as an officer of MACE, I was thrilled to hear that Sig Hartmann at Atari wanted MACE to do a show. I thought nothing could be better for MACE's image than to pull off a terrific show. Also, it had been quite a while since the Detroit area had a show, and some time since MACE was the host of such a show.

The October officers' meeting was filled with discussion of the merits and problems of doing an Atari show, and debate focused on Atari's commitment to User Groups and how we would involve the other Michigan clubs. The officers did decide Michigan Atari Computer Expo would be the name of the show.

The result of that meeting was to continue looking into the arrangements for a show, and MACE would pursue all of its options. The dates of May 6 & 7 were then fixed with Atari.

By the November officers' meeting, a place was picked and there was even a firm chosen to supply the rods and curtains for the booths. The officers had finalized a plan to include the other clubs in the show, without giving them any of the headaches of planning it, and we had repeated assurances from Atari about their commitment to User Groups. The officers approached the subject to the members at the November General Meeting and obtained the go-ahead to keep looking into arrangements.

At the December Christmas meeting, there was some more discussion of the Expo and mention of ST World's planning to produce a show in our area, but we had no dates for this show, and our dates had been set at least several months earlier with Atari Corp. Then, in January, as per our Constitution, MACE voted at the General Meeting to produce the Expo and to elect a Convention Manager to handle the details and create a show SIG. MACE was gracious to elect me to the position, and I've had both fun and frustration managing such a convention!

The Michigan Atari Computer Expo is set for May 6th and 7th at the Detroit Metro Airport Hilton off of I-94 in Romulus. All of our booths are full of developers, distributors and dealers.

We have User Groups from inside the state and out coming to the Expo to "strut their stuff," and many who aren't interested in a free booth are still bringing "van-loads" of members to see the faces behind their favorite Atari products.

These faces include representatives from

- Word Perfect
- ICD
- Alpha Systems
- Migraph
- Innovative Concepts
- Gribnif Software
- Scorpion/MicroDaft
- SofTrek
- USA Media
- BEST Electronics
- ST Informer/Index Legalis
- MichTron
- Total Control Systems
- AccuStar
- Mars Merchandising
- Hurricane Systems
- Joppa Computers
- CodeHead Software
- Nice And Software
- DataFree Corp.
- Electronical Software
- Unicorn Publications

Local dealers include Sector One, Basic Bits 'N' Bytes, United Computer, Computer Concepts and Rite Way.

Seminars are scheduled with many of the exhibitors and others like Darek Mihocka, creator of the ST Xformer, and DataQue's Chuck Steinman, who will be showing off the Turbo-816. Bob Puff, creator of many 8bit PD utilities, will be at the show and also may do a seminar. Other seminar topics include MIDI and MIDI Publishing, Hard Drive Kits, ST-Like Desktops for the 8bit Atari, and Copy Protection Pros and Cons.

Members of User Groups will receive discounts on products from the many different exhibitors participating in the User Group Discount Program, and those members of User Groups who can donate four hours of time to the show are eligible for the Gold Card Program which means they can get discounts above and beyond the User Group rates, plus being admitted for free to the show!

If you're a member of a User Group and wish to help MACE out and get a Gold Card in exchange, please contact me at (313) 973-8825. If your club wishes to reserve a booth for the show, please contact me at that number. Remember, a User Group can obtain a booth for no charge.

Even if your club doesn't wish to have a booth, your club can make money off the show! MACE is offering an advance ticket sales program where your club can sell tickets for any price up to the $5 price printed on the tickets, paying MACE only $2.50 per ticket sold. That means your club can give you the best price available on tickets before the show opens in May!

See you at the Expo!!

Michigan Atari Computer Enthusiasts, in conjunction with Atari Corporation invites you to the

MICHIGAN ATARI COMPUTER EXPO

at the Detroit Metro Airport Hilton, just off I-94 in Romulus, Michigan

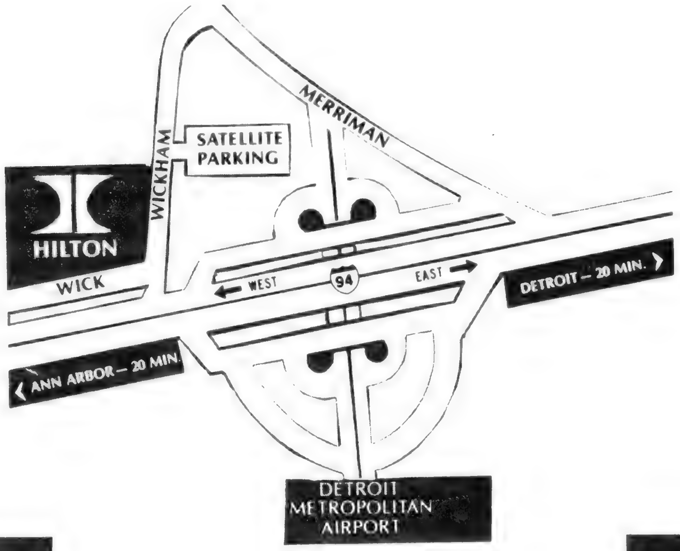
Over 30 Exhibitors including:

- Word Perfect Corp.
- Michtron
- Alpha Systems
- Gribnif Software
- TimeWorks
- AccuStar
- Migraph
- ICD
- Astra Systems
- Innovative Concepts
- SofTrek
- CodeHead Software
- BEST Electronics
- ST Informer/Index Legalis
- Scorpion/Microdaft
- USA Media
- Nice & Software
- Mars Merchandising

...and MANY MORE!

Seminars, Door Prizes and User Group Discounts at Most Vendors

All this AND Atari Corp. Representatives, too!!



SATELLITE PARKING
MERRIMAN
WICKHAM
HILTON
WICK
WEST
94
EAST
DETROIT – 20 MIN.
ANN ARBOR – 20 MIN.
DETROIT METROPOLITAN AIRPORT

Saturday, May 6
10 a.m. to 6 p.m.

Nearly 60% off room rates at the Hilton

Sunday, May 7
10 a.m. to 5 p.m.

40% off Coach air fares for Northwest flyers

Tickets are $5 at the door. Tickets are good for BOTH days of the show. Children under 12 years old admitted FREE of charge.

For advance tickets, contact your local Atari user group or send $4 per ticket to MACE, c/o Convention Manager, 3487 Braeburn Circle, Ann Arbor, MI 48108. Make checks payable to MACE.

A look at 8bit Utilites -- Diskcomm and SuperArc/Unarc

by Bob Puff

If you download quite a few files for your 8bit from a local BBS, or especially from the online services, you've no doubt used Super Arc and Diskcomm at some point in time. But have you ever wondered how these utilities were born, or what went into their making?

Diskcomm

First, let's talk about Diskcomm. Back in January of '85 (right after getting my Atari 1030 modem for Christmas), I saw a need to be able to transfer entire disks over the modem not just single files. Disk Communicator version 1.0, a simple BASIC program, satisfied that need.

The concept behind Diskcomm was to read all the data on a disk, sector by sector, then save it as one large file. Since files can be easily transferred, the other user would download the file, then "uncompact" the large file back into a full disk. This sector by sector method is needed for full-boot disks, but also had its uses in grouping a whole bunch of files. The program became very popular locally (Rochester, NY), and I created newer versions.

Along came other programs similar to Diskcomm, some making smaller files of the same disk: I knew my work was cut out for me! After adding more compaction types, warp speed for XF551s, modified 1050s and Happy drives, 130XE type extra memory support, and totally re-writing the program in all machine language, the current version 3.2 was released in late '87.

There is a special extender reserved for Diskcommed files — .DCM. If you encounter a file ending with .DCM (such as MYDOS.DCM), Diskcomm 3.2 is needed to recreate the original disk. The procedure is quite simple. Boot up your favorite DOS, and binary load Diskcomm. If you are using an upgraded computer, the program might ask if you will allow it to use this extra memory. If you are using the extra memory as a RAMdisk, then answer N. Otherwise, Diskcomm will use it to reduce the number of disk swaps needed on a single drive system.

You should now be at the main menu. Use the [C] and [D] commands to change the source and destination drive numbers, respectively. Now press [B]. You will be prompted for the source name. Enter the FULL name, and hit RETURN (in this example, enter "MYDOS.DCM"). Follow the prompts, and you will end up with a working disk! The source file need not be kept any longer.

As with any program, after it has been out for a while, you see where things could have been done better. The addition of ".DCM" to the filename of files created, easier access of subdirectories, and Happy fast-write are a few suggestions I have received from users. Perhaps in the future, those as well as a possible MIO RAMdisk backup option will be incorporated. Have any other suggestions? Let me know!

Super Arc

Super Arc is in a way similar to Diskcomm, but file-oriented instead of sector-oriented. The purpose of Arc is to take one or more files, compact them as much as possible, and store them as a single file, characterized with an .ARC extender. Super Arc uses three of the five total types of compression: Storing (no compression), Packing (strings of the same character are "packed"), and Crunching, which is the method most often used. (There is no easy way to explain that one!)

The Super Arc/UnArc project was started in the summer of 1988. AlfCrunch had hit our city, and was beginning to be widely used. I was amazed at how small the programs were; only a few dozen sectors in length. I said "If he can do it in that little bit of code, well!..."

Super UnArc

Through the help of a friend, I got the C source to the IBM version of Arc, and studied it for a week or so. Work on Super UnArc then began. The Storing, Packing, and Squeezing code were done in a couple days, but the Crunching code took a bit of thinking. The IBM code uses a lot more memory for tables than is actually necessary.

After a few more days of studying a book on the C language (I had never done anything in C before -- just Atari Basic and 6502 machine language!), the code was written. I was not very happy with its speed, however, even though it was much faster than the old ARC 1.2.

I went through another week of printing my crunching code out, studying it, comparing against the original, and finding ways of "tweaking up" things here and there. Finally, I released version 1.0 on GEnie for beta testing, and tackled Super Arc.

Here's when I got the big scare. All the time Super UnArc was being written, I never really looked at the code that created the arc files. They used tables that amounted to around 30K in length! The standard 8bit, after DOS, BASIC, and other drivers have been loaded, has around 32K of free memory. Certainly 30K of tables would not leave me enough room for the actual program!

However, after more digging into the source code, I found a way to conserve 10K in the tables, so they are only 20K long. Once again, the process of speeding up the code was in order. After a few weeks, it was ready for beta testing. I certainly had a "crash course" in C programming!

Super UnArc will probably be the program that is used most often. Let's say you download a file called MYGAME.ARC. When you set up your terminal for the download, it is a good idea to include the extender of .ARC. That way, you will remember to unarc it.

Boot up Super UnArc, and select [A]. Now enter the filename of your file (you need not type the extender; Super UnArc automatically adds it for you). In this example, you would enter "MYGAME." There's a little catch here that most people miss: If you did NOT put an extender on your filename when you downloaded the file, you need to enter a period after the name. An example of this: if the file on your disk were to be called MYGAME (no extender), Super UnArc will look for MYGAME.ARC. Adding the period after the name will disable the addition of .ARC, and find the file.

Assuming you entered the name correctly, Super UnArc will ask you for the destination filespec. You need only type the drive number (and RETURN) for the destination drive. There are other things that you technical users can do here, but for the most part a number is all that's needed. That's it! Told ya it was simple... :-)

Now let us compare Diskcomm and Super Arc. Diskcomm will compact a floppy disk sector by sector, resulting in a 10-20% size reduction. Since it does the entire disk, all the files on the disk can be grouped together. DOSes, Print Shop icons, and any disk that relies upon data in certain sectors can be backed up / transferred using Diskcomm. Super Arc will compact only the files seen by the DOS you use. It will usually reduce the data by 30-40%. There is no limit to how many files you can store in an arc file. Use Super Arc for file(s), and Diskcomm for those full-boot disks.

I hope this article has helped to clarify the use of the above programs. I hear that Phil Katz, author of the PKARC/PKPAK programs in IBM-land, has released PKZIP, a new standard of file compaction similar to, yet better than Arc. If and when this becomes the new file compaction standard (and if it does not use large look-up tables!), I'll do an 8bit version. (Super Arc is compatible with any .ARC file created on the PC, including "squashed files" done with PKPAK.)

Turbo ST -- The Software Blitter Made Better

by Bill Rayl

Since its arrival on the ST market, Turbo ST from SofTrek has been proving itself a useful addition to many an ST boot disk.

However, a number of ST owners have been reluctant to spend $49 for a product that speeds up text functions only. If you have not yet purchased Turbo ST because of price or because the product did nothing to speed up GEM and graphics functions, read on.

As with any good product backed by a company committed to supporting its products, Turbo ST has been steadily improving. Turbo ST version 1.4 now offers substancial speedup in scrolling and paging using GEM-based programs, as well as fantastic increases in TOS applications.

Just how much of a difference can Turbo ST make? Using a 1040ST, monochrome monitor and version 1.0 of TOS ROMs, paging through a 9035 byte "README.DOC" file using Flash 1.51 took 27.1 seconds.

Using the same setup with Turbo ST installed, paging through the text took only 17.3 seconds, a speed increase of over 50 percent. Using a color monitor provides consistently greater speed increases.

In a side-by-side comparison, Turbo ST even beats the hardware Blitter! Using a Mega ST with version 1.2 ROMs and Blitter, Flash 1.51 took only 14.9 seconds to scroll through the README file. Turning off the Blitter and using Turbo ST, it only took 14.5 seconds to scroll through the file!

Using the hardware Blitter and "software Blitter" together, the scrolling time was reduced to only 14 seconds flat.

Paging through text rather than scrolling line by line, Turbo ST delivers speed increases up to seven times faster than the ST alone.

In a test using the Devpac ST assembly editor (version 1.22) to page through a 24527 byte source file, version 1.0 ROMs crossed the finish line in 39.2 seconds. The same setup, using Turbo ST 1.4, came in at a remarkable 5.6 seconds! Even the Mega ST and Blitter couldn't compete, with a time of 16.5 seconds.

Those are some very impressive numbers, but they're nowhere near as impressive as actually watching Turbo ST in action on your machine.

The Invisible Blitter

Although you can't help but notice the benefits from Turbo ST, the software itself is totally invisible to you and to your ST. Using Turbo ST is as simple as copying TURBOST.ACC to your boot disk or hard drive. When you boot your computer, Turbo ST will automatically be installed and start working.

While Turbo ST is installed and active, the software intercepts calls made to GEM concerning text and screen functions. Instead of the built-in, and demonstrably slower, functions of the ST's operating system, the faster routines used by Turbo ST get executed.

To see the difference in speed Turbo ST makes, simply view a text file on your screen with Turbo ST installed. Then, go to the pull-down Desk menu on the ST desktop, select the Turbo ST desk accessory entry and then "Remove" Turbo ST. Now, view that same text file again.

That brings us to a feature of Turbo ST that, potentially, could be very useful to you — the ability to deinstall the accessory without rebooting your computer.

If a package is released in the future that does not function well with Turbo ST, a simple click of the mouse eliminates your problems. Once you're done using the uncooperative software, you can turn Turbo ST back on kick your ST back into overdrive!

Currently, Turbo ST is fully compatible with most of the recent versions of ST software packages on the market. There are minor incompatibilities with GFA BASIC 2.0 and the shareware Deluxe SlideShow program, but only in low resolution. Easel-ST has a problem with Turbo ST's improved Fill Rectangle routine, and a separate version of Turbo ST compatible with Easel-ST is included on the Turbo ST disk.

Version 1.4 of Turbo ST also supports G+Plus from CodeHead Software. Previous versions of Turbo ST caused printing problems with GDOS programs, such as Timeworks Desktop Publisher. Using G+Plus and Turbo ST together, those problems have been solved.

User Group Program

With the recent enhancements, including the speedup of GEM functions, Turbo ST has become one of the "must have" utilities available and is well worth the $49.95 retail price to anyone who uses their ST more than on a casual basis.

Members of Atari user groups can

take advantage of some excellent deals from SofTrek, getting Turbo ST at reduced cost and FREE upgrades. Here's how the user group deals work:

Any user group that can get three or more members together can buy Turbo ST for only $35 each. On top of that, if 10 members of a club become registered owners, SofTrek will supply your group with a FREE copy of Turbo ST. Your club can, in turn, update the copies owned by those registered users.

Not everyone out there is going to need what Turbo ST has to offer. If you use your ST primary for entertainment, the power of Turbo ST isn't going to make your arcade games play faster or smoother. Also, programs that totally bypass the ST operating system calls will not be affected by Turbo ST.

All in all, Turbo ST is an excellent value for anyone spending any length of time using their ST for word processing, database management, programming and any other productivity-oriented activities. With Turbo ST, when you say jump, your ST doesn't even wait to ask "How far?"

[Editors' Note: SofTrek will be exhibiting at the Michigan Atari Computer Expo in May answering questions and taking orders for Turbo ST. They will be offering a discount to User Group members off the already reduced show price on Turbo ST.

TURBO ST

By

SOFTREK

P.O. Box 5257
Winter Park, Florida 32793
(407) 657-4611

— FASTER THAN A SPEEDING BLITTER !!

- Makes your 520 / 1040 ST™ outrun a Mega ST™.
- New version supports HiRes 40 and 50 line modes.
- Makes *ALL* versions of TOS run faster.
- Only $49.95 — Less than half the cost of a hardware blitter.
- Installs automatically — just load it and forget it.
- No soldering, no copy protection, no setup — Just speed.

Turbo ST vs The Blitter (% speed increase)

	Monochrome		Color	
	Blitter	Turbo ST	Blitter	Turbo ST
dBMan 5.0	10%	59%	8%	60%
Data Manager 1.1	83	94	85	88
1ST Word 1.0	37	35	34	41
GFA BASIC 2.0	22	69	13	65
Interlink 1.8	53	63	46	71
ST BASIC 1.0	221	517	219	567
ST Writer 3.0	18	116	17	127
Word Writer 2.0	34	31	35	37

Results obtained while paging through an appropriate data file.

Ask for Turbo ST at your local dealer or send $49.95 plus $2.00 shipping and handling to SofTrek, P.O. Box 5257, Winter Park, FL 32793. Florida residents add 6% sales tax. Visa and MasterCard phone orders accepted. Call (407) 657-4611. Upgrades to version 1.4 are available for $5.00 U.S. plus your original disk. Offer expires 60 days from the date of this publication.

Turbo ST does not speed up programs that use GDOS fonts or that bypass the GEM operating system, such as PC Ditto, but is compatible with them. TOS, ST BASIC, ST Writer, 520 ST, 1040 ST, and Mega ST are trademarks or registered trademarks of Atari Corp.

8Bit Uses for an ST Mouse

by Brent Fisher (CACE)

Now is the time for all good men, naahhh that's not it.

Oh, hello everyone. I was just thinking of something else in preparation of this fine feature article that I am writing to...well you might call it a rebuttal...no, better yet call this a reply or even just a continuation of an article by Jay Pierstoff called Commodore 1350 Controller that I saw in issue #147 of Zmagazine.

I realize that this article (it is a reprint from a July 1986 issue) is a couple of years old, so I will try to not be too hard on it, but still I think that a few points need to be covered. First, it is now possible to purchase an ST mouse and it readily hooks up to any 8bit computer.

With the ST mouse, you can play a very mean game of Missile Command. To be quite honest, that is the only reason I bought my mouse. You would be surprised at how well your scores do after you get a mouse pad.

You say "What good will the mouse do if you can only use a joystick with Missile Command?" Well, you see, that is not entirely the case. Way back when Atari released the cartridge (I really don't know when they did it but I know it was one of their first), they released it with a little extra that Atari apparently didn't know about.

Way back in the days before Tramiel, when Atari was owned by Warner, the company didn't allow their programmers to put their names on the games that they programmed. So the programmers sometimes added a little bonus that the company wasn't privy to, such as the one in the Missile Command cartridge (and probably exists today in the XEGS version).

If any of you own a CX22 Trackball, you may have noticed it has a switch on the bottom left-hand side that says "Joystick" and next to that "Trackball." Well, it seems the ingenious programmer knew about this product coming out and added a Trackball handler to his creation. I know, I know, you're saying "Get on with it already," but hey, if I didn't give you some Atari lore who would?

Well anyway, if you press the 'Control' key and the 'T' key together you will notice the screen will flash and as soon as you plug in the Trackball you will have proportional control over the targeting cursor.

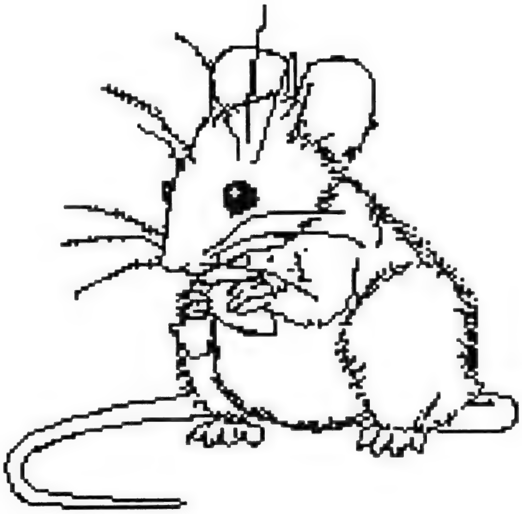
"Ah ha," you say, "but what has this to do with my ST mouse?" Well, if you plug in the mouse you will notice it also gives you proportional control over the cursor in Trackball mode.

While we are sort of on the subject of the Track-ball, Mr Pierstorff also mentions that the Commodore mouse acts just like a joystick. Well, that's fine, but those of you who own a Trackball also know that, as I described in the previous few lines, the Trackball it will also work as a joystick.

I realize that there are not as yet many applications for an ST mouse, but there are a few. For instance, both of the new graphic operating systems are said to use the ST mouse for pointer movement, and the public domain program Icon Shop allows the use of the mouse also.

Another point mentioned is that Atari has not released an 8bit mouse as yet. Well, near as I can tell, we really don't need one, especially if you pick up a Trackball. I have seen these gems advertised for around $7 to $10, and they really do make a good investment.

[Editors' Note: Don Neff wrote a very fine article in the May, 1988 issue of the Michigan Atari Magazine on modifying an Atari or Wico Trackball for use with both the ST and 8bits. If you don't have that issue and would like it, please send $2 for a copy to the Unicorn Publications address. Other back issues of MAM and AIM may be obtained for the same price, except for Feb. and Sept. 1988 issues of MAM, of which only photocopies of articles are available..]



REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM

(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

DigiSound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only $39.95

Polydisk

Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**

(Clock option card is also available for Polydisk $29.95)

Goodbye GDOS, Hello G+Plus

by Bill Rayl

Without a doubt, some of the most useful and well-thought-out utilities available for the ST have come from the programming minds of Charles Johnson and John Eidsvoog.

Before teaming up as CodeHead Software, both programmers had already released a number of excellent commercial and PD/Shareware titles. Under the CodeHead name, they've released one truly outstanding product after another. This article focuses on one of those products — G+Plus.

What is GDOS and G+Plus Anyway? To put it quite simply, G+Plus is a replacement for Atari's GDOS (Graphic Device Operating System). Those of you who use program such as Degas Elite, Word Up, Fontz, Timeworks DTP, Easy Draw and SuperBase Professional have all used GDOS to some degree. GDOS is, primarily, an add-on piece to the ST operating system that handles loading of fonts and "device drivers."

Commercial packages such as those mentioned above include Atari's GDOS, a number of GDOS-compatible fonts and device drivers for various printers, plotters or other output devices.

The GDOS "patch" resides in the AUTO folder of your system boot disk. At bootup, GDOS reads in a file called ASSIGN.SYS, which must be found in the root directory of your boot disk. The ASSIGN.SYS file is a text listing of all the fonts and device driver(s) recognizable by GDOS.

Using GDOS gives your ST the ability to send high quality output (such as the page you are reading) to any output device, assuming you have a working device driver for that device.

All that sounds great, but GDOS is not perfect. The first thing you notice when you start using GDOS is that your ST seems a bit more sluggish. You aren't imagining it — GDOS does slow your ST down.

Also, if you use more than one program that incorporates GDOS, you face the problem of either creating one master ASSIGN.SYS file or having individual boot disks for each and every program using GDOS. That can get to be a real headache.

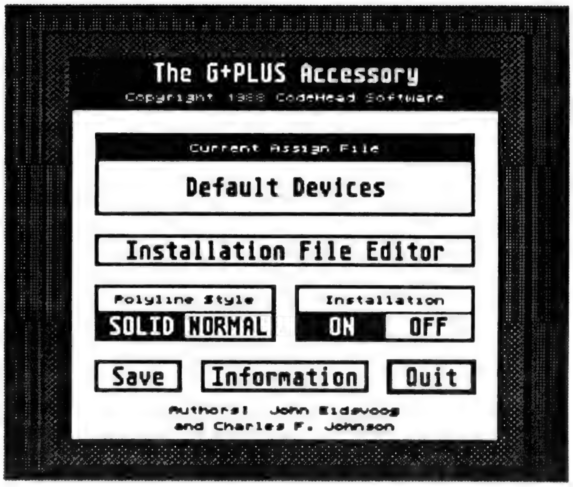
G+Plus takes all the headache and hassle out of using GDOS programs. G+Plus is actually two separate programs. The G+PLUS.PRG program is the actual replacement for GDOS.PRG from Atari. Simply delete GDOS.PRG from the AUTO folder of your boot disk and put G+PLUS.PRG in its place.

Similar to GDOS, the G+Plus auto-boot program will attempt to read in an ASSIGN.SYS file from the root directory of the boot disk. Unlike GDOS, however, G+Plus does not require the ASSIGN. SYS file to be present at that time. When running a GDOS program, simply hold down the Alternate key on your ST and G+Plus will present a Dialog Box from which you can load the proper ASSIGN.SYS file.

The "other half" of the G+Plus utility package is G+PLUS.ACC, a standard ST accessory file. It is not necessary to install this accessory to use the G+Plus auto-boot program. However, the accessory gives you even more flexibility and adds a feature that speeds up your ST, even when not using GDOS programs!

To install the accessory, simply copy the G+PLUS.ACC file to the root directory of your boot disk (the same disk that now contains G+PLUS.PRG in its AUTO folder). From now on, everytime you startup your ST using this boot disk, both parts of the G+Plus package will be installed automatically.

Once installed, moving the mouse up to the "Desk" drop down menu and selecting the "G+PLUS Accessory" entry, you will be presented with a dialog box just like the one below.

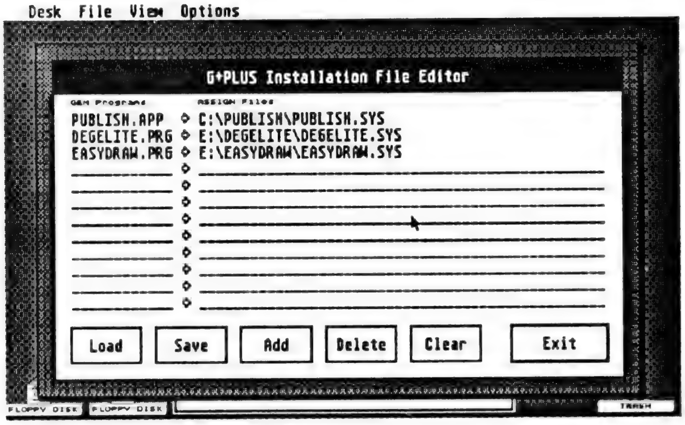


G+Plus Means Flexibility

The "Polyline Style" entry allows you to select Normal or Solid mode. Using Solid mode, G+Plus actually speeds up the GEM desktop line drawing routine. This speedup can be demonstrated quite visibly by running a program called ZOOMTEST.PRG included on the G+Plus disk. If you wish to have Solid mode as your default, clicking on the "Save" button at the bottom left of the dialog box will modify the G+Plus accessory to reflect your choice.

Clicking on the "Installation File Editor" option brings you to the screen shown at the bottom of this column. Using this feature of G+Plus allows you to predefine up to 12 different GDOS applications and to associate a separate ASSIGN.SYS file to these applications.

As you can see from the Figure, it is possible to customize the ASSIGN.SYS files by changing their names to more accurately reflect which files work with which GDOS programs. Saving this "installation file" to a file named INSTALL.INS in the root directory of your boot disk will enable G+Plus to automatically recognize the proper program and ASSIGN.SYS file combinations.



```
PUBLISH.APP  ◇ C:\PUBLISH\PUBLISH.SYS
DEGELITE.PRG ◇ E:\DEGELITE\DEGELITE.SYS
EASYDRAW.PRG ◇ E:\EASYDRAW\EASYDRAW.SYS
```

You can also set up more than one "installation file" and switch between them by clicking on the "Load" button shown at the bottom left of Figure 2. This allows you to pair up GDOS programs with their ASSIGN.SYS files for more than the 12 application limit of one "installation file."

Also contained on the G+Plus disk is the excellent article by Douglas Wheeler entitled "Everthing You Wanted to Know About GDOS." This article explains the ins and outs of GDOS in easy to understand terms. The G+Plus manual also gives a brief description of GDOS and ASSIGN.SYS files. Also included in the 32 page manual are two pages of technical information describing how developers can use the advantages of G+Plus in their GDOS programs.

There is an ever-increasing number of programs coming out for the ST using GDOS fonts and device drivers. Using G+Plus to replace Atari's GDOS makes using these programs much easier and far more enjoyable. If you currently use programs with Atari's GDOS, switching to G+Plus will make a world of difference. Like upgrading your computer's memory or adding a hard drive to your system, once you've moved up from GDOS to G+Plus you'll wonder how you ever survived without it.

G+Plus (Retail $29.95)

ProCopy ST BACKUP UTILITY

You can't backup your software because copy protection locks you out. **ProCopy** is the key!

- Protects against the accidental loss of expensive software
- Works with all Atari STs
- Copies both S/S & D/S disks
- Use with 1 or 2 disk drives
- Not copy protected
- **FREE** shipping and handling
- **TOLL-FREE** telephone number
- Updates are only $12 with return
- Orders shipped same day
- Disk analyze function included

MultiDesk -- The Accessory for Your Accessories

by Bill Rayl

To put it bluntly, before MultiDesk hit the market, I hated desk accessories. Sure, there are literally hundreds of great and highly useful desk accessories out on the ST market, both public domain and commercial. But, before MultiDesk, I used very few of them.

Partly, this was due to the ST allowing for only six desk accessories at a time. Another reason was that, once installed, a desk accessory hangs around until you reboot your machine or switch resolution. Unless you did a lot of careful planning, and created a separate boot disk for every conceivable situation, chances are you'd end up either wanting an accessory that wasn't installed or wasting precious memory with an accessory you didn't need.

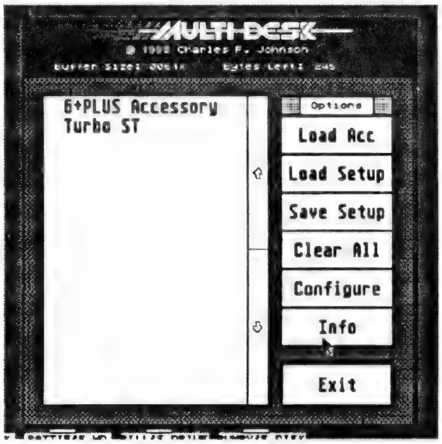
Consequently, I chose my six "most necessary" desk accessories and used them at all times. Keeping track of a handful of boot disks just never appealed to me. Lots of useful accessories that I would have loved to put on my boot disk -- including calendars, appointment books, notepads, and even games -- never saw the light of day after the first usage.

And then came MultiDesk.

MultiDesk, the Accessory

CodeHead Software's MultiDesk removes every conceivable limitation from using desk accessories on your ST. First, it allows you to load in up to 32 desk accessories. Itself a desk accessory, MultiDesk can be loaded into itself, virtually giving you the ability to load as many desk accessories as your computer's memory will allow.

As with all desk accessories, simply placing MULTDESK.ACC on your bootdisk and then rebooting your computer will install MultiDesk. Moving the mouse pointer up to the "Desk" drop down menu in the upper left corner of your screen and clicking on "MultiDesk" will present the dialog box shown below.



With MultiDesk installed, you can load and unload desk accessories at will. You can even load desk accessories while running GEM programs that allow access to the "Desk" drop down menu. Accessories can be loaded from any drive or folder, giving even more flexibility.

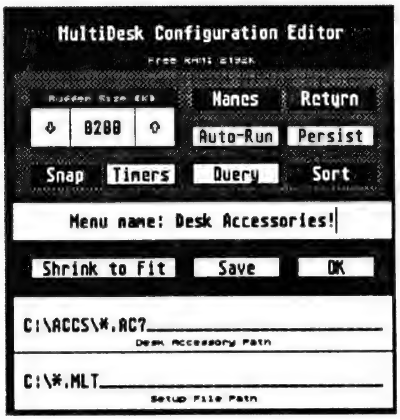
To load individual accessories, simply click on the "Load Acc" option and you will be presented with the familiar Item Selector. Select the accessory you wish to load and click on OK. Your selection will now appear in MultiDesk's accessory box. To access the accessory, simply click on its name.

If, for some reason, you need the memory being used by the accessories you've loaded, selecting the "Clear All" option will allow you to remove all the accessories loaded into MultiDesk. This frees up that memory for other uses, a handy feature if you own a standard 520ST.

MultiDesk also has the ability to automatically load up to 32 accessories at bootup. If you have a set of accessories that you always wish to install, simply load them in one by one. Then, select "Save Setup," which will allow you to save a listing of all accessories currently loaded into MultiDesk. At bootup, MultiDesk looks for a setup file with a particular name. If that file is found, MultiDesk will load in the accessories listed in this file.

The "Save Setup" feature also allows you to group accessories in a logical way. These setup files can later be loaded from the desktop at any time. For example, you can save a setup file of all your game accessories, such as Breakout, Othello and Minos. Then, when you want to take a break from wordprocessing or databasing, simply select the "Load Setup" feature of MultiDesk and let the games begin.

Selecting "Configure" while in MultiDesk takes you to the Configuration Editor shown on the next page. In this dialog box, you can influence the way MultiDesk treats accessories when loaded and executed. For example, the "Auto-Run" feature determines whether or not an accessory is automatically run when loaded. Each of the options is thoroughly explained in the 22 page manual accompanying the MultiDesk disk.



8288

Menu name: Desk Accessories!

C:\ACCS\*.AC7

C:\*.MLT

MultiDesk, the Program

For those of you out there who never use accessories, simply because they take up memory, MultiDesk is just what you need. "But wait a minute," you say. "You just told us MultiDesk IS an accessory." Well, it is...but, it's also a program! Simply by renaming MULTDESK.ACC to MULTDESK.PRG, you can actually run MultiDesk from the desktop, load in and use accessories. Once you're done with the accessories, clicking on "Exit" in MultiDesk will take you back to the ST Desktop, freeing up the memory used by the accessories and by MultiDesk. Using MultiDesk as a program, you can have your accessories and your memory, too! This works great with accessories for setting your screen colors or for calculators and calendars. And it all works without the need to reboot your computer!

If you're a user who keeps multiple boot disks just for your accessories, then MultiDesk is for you. If you use only a few (or no) accessories but feel you're missing out on literally hundreds of top notch accessories, then MultiDesk is for you. If you never use accessories because of the six accessory limit or because you have "better" use for your ST's memory, then MultiDesk is for you. In other words, if you own an ST, then MultiDesk is for you!

ST/MEGA

Michtron Eprom Burner (up to 512K eproms) $199
Atari SH204 Host Adapter This is the cheapest Atari hard drive host adapter availlable. Can be used with standard hard drive controller cards like the Adaptec 4000A. Great for building low cost hard drive systems. $60
P.C. Ditto cable kit (3 ft cable with installed 14 connector one side and bare wires the other side and 34 edge connector + pin outs) $10 ea.
Because you asked for them we have brought in! 3 ft SC1224 and SM124 monitor extension cables! (M to F) For use with Goldstar and Samsung monitors with one sided short cables $25
13 pin Female cable connectors $4.75
14 Pin Female cable connectors $5.60
(Use these 14 pin Female connectors with a standard printer switch box and make a drive switch box for P.C. Ditto drives)
Mouse Feet (our feet have twice as much teflon material) $4 pk (4)
Mouse Eyes (Taiwan mouse only) 8pk (one mouse set) $5
Mouse Cleaning Kit by Tacklind $12.95
Mega Keyboard Covers $8.50 ea.

400/800/XL/XE

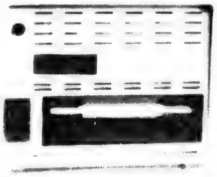
Digital Devices APE-LINK Kits (adds extra SIO Connectors to Your Atari Daisy Chain) Bare P.C. Board $10 Kit $21
1030 Modem Special ! 29.95
New 256K Atari Game Cartridges in stock. See our cataloge for listing!
Thomson Proburner Eprom Burner $149.00
XL Keyboard Mylars in stock now! $22 ea
In Stock 130XE Cartridge Connectors $6.30
Many people have asked which Mailing List program we use at Best Electronics, we currently use Super Mailer+ from Royal Software. Super Mailer program (D) $39.95
XL to XE Software Compatiablty Mod by Tom Lawless. This two chip/switch mod is for enhanced 800XL computers (256K-512K). $8
Hardware upgrade kits and P.C. boards that require the 41256K ram chips have been put on hold because of the high price of ram chips. We hope to ship again once ram chip prices start to drop down!

Astra gives up !!!

No we are not going out of business... We are going out for business !!!

The demise of many Atari dealers, and the reluctance of many more to carry much inventory forces us to announce:

Astra Systems goes Factory Direct !



SYSTEM HD+

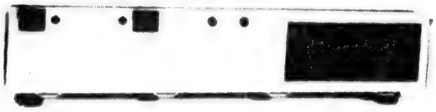
Our original offering for the ST computers is now available in 20, 30, and 40 megabyte capacities. With precision double sided 3 1/2" microfloppy and its tough construction it ranks as the one to beat.

SYSTEM HD+ 20	$849.95
SYSTEM HD+ 30	$919.95
SYSTEM HD+ 40	$1069.95

RM 60/120 & RM 80/160

Our rack mount units for the MIDI musician fit portable and permanent racks.

RM 60	$1295.00
RM 60/120	$2095.00
RM 80	$1995.00
RM 80/160	$3495.00
EXPANSION 60	$ 875.00
EXPANSION 80	$1595.00



THE EXPANDER

A truly expandable hard disk system. Not a chainable one as many competitors are offering. Contains space, cooling, and sufficient power supply to handle up to 120 megabytes of storage inside the under-monitor case. Built-in surge protection for its 4 AC outlets. Controls the CPU and peripherals from the front of the unit. Optional precision double sided 3 1/2" microfloppy. Twenty, thirty, and forty meg units.

EXPANDER 20	$759.95
EXPANDER 30	$819.95
EXPANDER 40	$999.00

VISA AND MASTERCARD ACCEPTED

SolaPak
The Accessory with It All!

by Patricia Snyder-Rayl

Do you use a print spooler accessory or a ramdisk accessory or clock accessory or a screen saver accessory or any combination of those?

Perhaps you're tired of all the trouble you have to go to, not to mention the memory these individual programs take. Then SolaPak v. 3.04 is for you!

SolaPak is a print spooler, a resettable ramdisk, a screen saver and a clock program all rolled into one. Each of these features has more to them than most of the other ramdisks, print spoolers, etc. available elsewhere, plus the program itself takes only 12K of your computer's memory with all its features installed, not including whatever size ramdisk you choose.

Additionally, SolaPak is constructed to make changing your set up as easy as one, two, three. On the SolaPak disk is a program called SPMOD.PRG. This slick little program displays a chart of the different functions of SolaPak and you only need to use the mouse pointer to click functions on and off. This program is also where you choose what printer you have from the extensive list, or you can easily create your own printer driver.

SolaPak's Documentation

If you're a new ST owner, the detailed documentation will help you figure out what you need to do, step by step, and even includes the "basic training" information on how to copy files, disks, etc. for the very novice user. The documentation is on disk and needs to be printed out for future reference, but contains in its 30 pages everything you need to know to get SolaPak up and running in any manner of configuration.

The author, Tim Hunkler, even suggests changing the name of SolaPak in your auto folder to help you remember what the function of the configuration is, for example, SolaPak may be named Ram300h.prg to remind you the program is set up for a ramdisk of 300K called Drive H. It is these helpful tips and the depth to which the program's function are explained that really make the documentation shine.

SolaPak's Features

SolaPak's ramdisk and printer spooler work together so you don't need to set aside space for each feature. The print spooler borrows space from the ramdisk you've set up (if you're using the print spooler alone, then some memory would be set aside), allowing you to put up to 8 files into the queue (line) to be printed. Each of those files can have different attributes, plus SolaPak can be set up to automatically double or triple space your text and create margins, etc.

The printer spooler also comes with a feature called the Printerceptor which makes it possible to "flush" out the buffer if you decide not to print something you have already queued up (among other things). The printer spooler itself allows you to pause, stop printing and delete files from the queue.

The ramdisk takes up as much memory as you tell it to...ie, there is no waste. If you want a 300K ramdisk and you do a "Show Info" on the drive, you'll see you have 300K available to use. Others give you as little as 289K to work with.

The screen saver and corner clock are very useful in and of themselves. The screen saver even has a "check modem" feature. If you have a modem connected to your computer, it will turn the screen on when a change in status is detected.

This means BBS SysOps can put SolaPak in their auto folder and run their BBS program The screen saver will turn off the screen when noone is online and turn it on again when someone calls. If you don't have a BBS running on your ST, you may be interested in the more common feature of the screen saver — the screen is turned off after a period of inactivity and a touch of the keys or mouse will reactivate it, avoiding image burn-in.

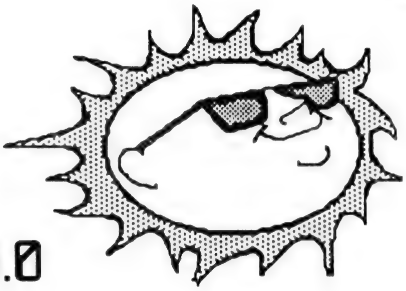
The corner clock is resettable each time you boot the computer, or if you have a clock chip, the clock will read the time and date from it. The clock sits in the upper right corner of the screen, and only takes up about half an inch of screen space. In high resolution, the clock can have two fonts — digital or regular — but the clock will work in all resolutions and even works in TOS programs!

This is the feature I like best of all the features in SolaPak. It helps me keep track of the time I'm on the computer so I don't miss something important I've got planned. It's too easy to lose track of time when you're concentrating on killing those last aliens or writing that last paragraph that's got to be worded just so!

I highly recommend getting SolaPak, since it contains the most commonly used desk accessories all rolled into one program, and it does everything so well. SolaPak sells for $30, and is well worth the money, especially if you've got a tight memory budget or use accessories often.

NEW FEATURES, SAME OLD PRICE: $30

SOLAPAK



For all 520/1040 ST's and MEGA ST's

V3.0

AN INTEGRATED DESK ACCESSORY OFFERING THE FOLLOWING FEATURES:

- PRINT SPOOLER PRINTS WHILE YOU RUN OTHER PROGRAMS
- RESET TOLERANT RAMDISK SURVIVES PROGRAM CRASHES
- SCREEN SAVER, ACTIVATED BY KEYBOARD, MOUSE, OR MODEM
- SCREEN CLOCK, ULTRA SMALL, WORKS IN ALL RESOLUTIONS

UNLIKE MOST OTHER MULTI-FUNCTION DESK ACCESSORIES, SOLAPAK V3.0 FEATURES A NEW DYNAMIC LOADING TECHNIQUE THAT ALLOWS YOU TO LOAD ONLY THE FUNCTIONS THAT YOU DESIRE.

PRINT SPOOLER: Up to 8 files queued for printing, each can have different print attributes. 32 user defined print option buttons lets SOLAPAK support nearly every parallel printer. Setups for dozens of printers are provided along with a utility for making your own custom printer control buttons. Built-in features exist for producing top, bottom, and left margins as well as printing double or triple spaced text. Queue controls let you pause and continue printing or delete individual files from the queue.

New **PRINTERCEPTOR** feature intercepts printer output from most programs and redirects it through the spooler. Unlike most spoolers, SOLAPAK does not require a separate spooler buffer. It "borrows" space from the integrated ramdisk.

RAMDISK: Low overhead, ultra fast, reset tolerant, autoloads user specified files on boot up. User selected ramdisk size, drive ID, number of files. No size limit. Hard disk compatible.

SCREEN SAVER: Turns your monitor off during periods of keyboard and mouse inactivity. Restores screen instantly at the touch of a key or mouse movement. New modem activity sensor makes it great for BBS's.

+ MORE: SOLAPAK is not copy protected; will automatically install at boot; works in all screen resolutions; sets time/date; disables disk write verify; sets printer width; includes new screen clock; 30+ page manual on disk; 4 month warranty. An installation utility makes nearly every feature optional. SOLAPAK is written entirely in assembly language for the fastest speed and smallest code: Only 12Kb + ramdisk size with all options installed. As little as 1Kb overhead for a ramdisk and screen saver.

Ordering: Send $30 cash, check, or money order made payable to Tim Hunkler. AZ residents add sales tax. Previous SOLAPAK owners may update by sending original disk by standard mail along with $3 update fee. Write for more info or leave your name and address with our phone machine: (602) 899-6992.

Solar Powered Software 1807 N. EVERGREEN, CHANDLER AZ 85224

The Atari ST Book
Tips for Beginner and Advanced ST Users

by Bill Rayl

Here is a book that all ST owners should have on their shelves. The Atari ST Book by Ralph Turner provides a wealth of hints, tips and little known "secrets" concerning the Atari ST line of computers. Whether you own a 520ST, 1040ST or Mega, and whether you're a beginner or advanced user, you should own a copy of this book.

For the new ST owner who feels lost and bewildered, the Atari ST Book provides step by step instructions on copying files, setting the Control Panel and using the Item Selector.

Individual chapters deal with such often confusing topics such as RAM-disks, the AUTO folder and desk accessories. Each topic is presented in easy-to-understand terms. In the case of the AUTO folder chapter, for example, the chapter begins by defining what an AUTO folder is and what it can do for you. Next, step by step instructions help you create an AUTO folder. Then, the chapter details what kinds of programs will run in your AUTO folder at bootup and gives you some troubleshooting tips.

For the more advanced users, The Atari ST Book covers topics such as Installing an Application, Modems and Telecommunications, Word Processors (with a section detailing the features of the most popular word processors available for the ST), and even a section on Chess and the ST.

Other topics covered in the book include Printers, Files and Their Management, Cold and Warm Boots, Public Domain Software and a Miscellaneous section that contains some very useful hints and suggestions for all ST owners.

Included in the book is a list of magazines from around the world that contain ST coverage. The list includes addresses, phone numbers, and information concerning the type of coverage and number of issues printed per year. A few of the magazines on this list have come and gone already, mostly U.S. magazines like ST Applications, but the list should be helpful to anyone wishing to obtain information on the European magazines.

The 160 page book includes Table of Contents, Introduction, 17 informative chapters, two Appendices, and a very thorough four page Index that makes using the Atari ST Book even easier. Also included with the book is a "Free Consultation Coupon" from the author. Simply send in the coupon, along with a self-addressed, stamped envelope and letter containing a question you'd like answered or problem you're having with your ST. Mr. Turner will then try to answer your question or solve your problem...free of charge.

Over all, The Atari ST Book made for very pleasurable reading. Mr. Turner's easy-to-understand yet thorough discussion of each subject presented is a blessing to all novice ST owners. Having owned an ST since early 1986 and using that ST on a daily basis, I consider myself an advanced ST owner. Even so, I found a number of tips and pieces of information that I never knew about the ST. I highly recommend this book to all Atari ST owners. Furthermore, all user groups supporting the ST should purchase at least one copy of The Atari ST Book as the information in this book can easily be adapted to New User classes.

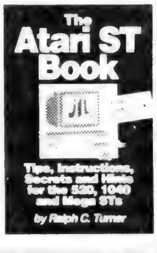
BEFORE

"I used to feel like a dummy. But with* The Atari ST Book, *I've learned to embed printer codes in text and use a word processor to alter my* DESKTOP.INF *file."

AFTER

In the past, many of the ST's features and capabilities hadn't been adequately explained in language that the average user could understand. But now the 159-page *Atari ST Book* provides step-by-step instructions that help both beginning and experienced users get the most out of their STs. And no knowledge of programming is required!

"Very useful on every level, from rank beginner to the most advanced ST owner." (*ST Business Magazine*) "Hard copy of a year's worth of user group meetings run by a master teacher." (*ST Informer*) "Genuinely helpful...multitude of tips...pure pleasure." (*Current Notes*)



The Atari ST Book
Tips, Instructions, Secrets and Hints for the 520, 1040 and Mega STs
by Ralph C. Turner

$16.95 + $2.00 shipping. Check, money order, VISA/MasterCard. Index Legalis, P. O. Box 1822-41, Fairfield, IA 52556 (515) 472-2293

The Collector

by Gordon Totty (MACE)

The truth of the matter has finally dawned on me. At last, I know what I am. I have "found myself." I can look at my image in the mirror now without the lost, anxious expression on my face. How often did I used to wonder: what, why, who? Now, I enjoy the power that comes with knowledge. Like Popeye, I am what I am. Beyond that silly sailor, I am a collector!

Why else would there be three computer sytems operating in my home? Why else would I own almost a dozen word processing programs? (My only regret about my word processing collection is that I never purchased the magnificent program that O.S.S. used to publish, The Writer's Tool. This one has become scarce now. The other day I was surprised to come across Letter Perfect, and was pleased to see that this "oldie" is still on a shelf, even though it was in the closeout sale area.)

The only explanation for the piles of books, magazines, and disks that clutter my study is that I am a collector. I could not possibly use all of this stuff in one lifetime. There is far more software than I need. But I *want* it. And after I fiddle with it for a while, *I want to try something different.* But, hallmark of the collector, I do not want to dispose of the stuff that I do not fiddle with anymore. "You never know, might need this some day. Might come in handy." Sure, pal, your house might be exposed to a massive dose of radiation, and only one word processor survive. You'd be glad you still had that one to use to write to dear old Mom and tell her that you are turning green and glowing in the dark!

A collector. No question about it. Many of you, too, I suspect. I see that acquisitive look in your eyes at the meetings.

Another clue to the breed is the "need" to buy the latest, improved program. "But, honey, *this* word processor has a new, automatic,, comma,,, feature,,,,. The ad says,,, you'll never be at a loss,,, for a comma,,,,,again. I *NEED* it!"

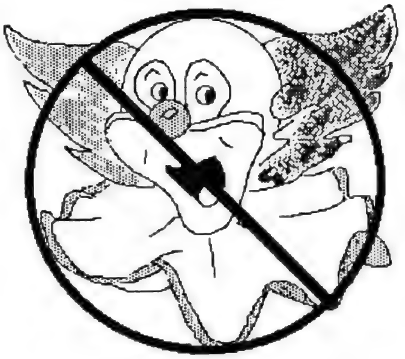
That's me. Heaven help me, what fun it is!

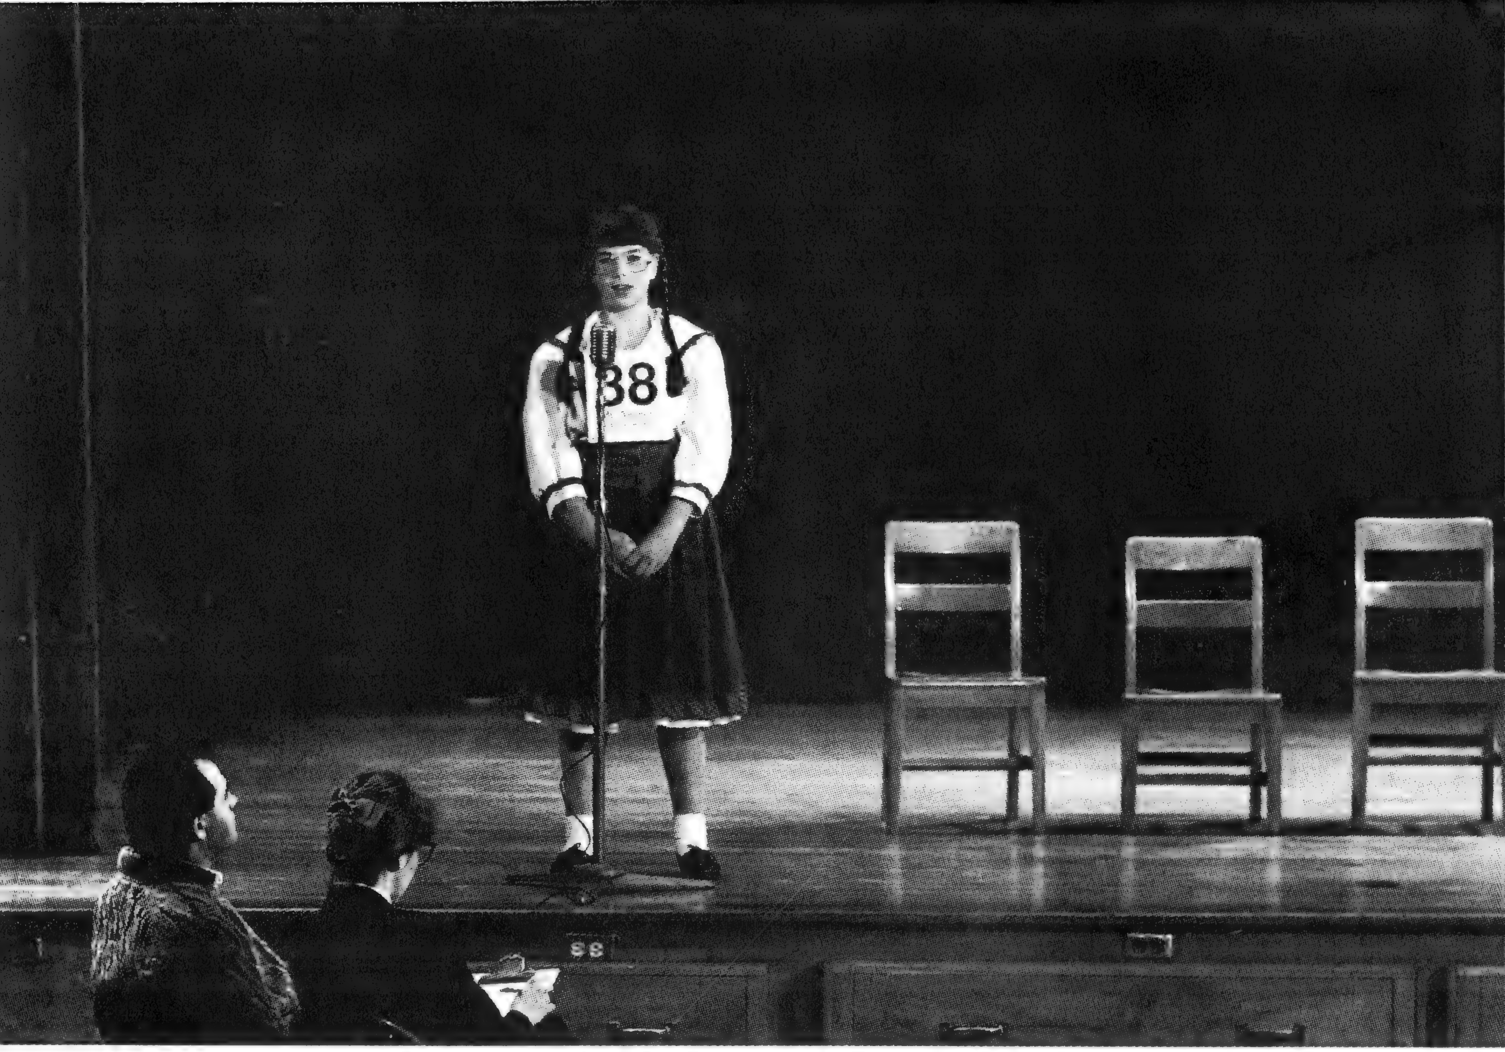
That is the only explanation for my recent purchase of *Timeworks Desktop Publisher ST.* I need a desktop publisher like I need another hole in my head. But, this is the latest rage. Gotta get in on it and quickly, before it is too late. Everywhere I turn I see another article about DTP. So, I had to buy one to fiddle with. Fortunately, the Timeworks program is reasonably priced, depending on how hard you shop around. I paid $79, and consider it cheap because it comes with a fancy manual and six disks. The disks alone are worth about $7.20 blank, but these have stuff on them! A good three-ring binder costs three or four dollars empty, but this one comes with paper.

This article is not intended to be a review of Desktop Publisher ST. I do not yet know enough about the package, or indeed the whole concept, to write an informed review. I will tell you, however, that I am very pleased so far. The program is reasonably priced; you get a lot for your money (kidding about collector mentality aside). It is fun to use.

Also, it is very easy to use. Timeworks has a chapter in the documentation titled, Quick Start Mini-Manual. That is about all I have read so far, and in short order this chapter has you creating documents. Elsewhere in this month's issue is a two-page sample of my first effort, a gag newspaper called Checkout Chatter. A gag newspaper is designed either to tickle you into a smile or gag you into a desire to retch. My little effort will tickle you, right in the back of the throat.

[*Editor's Note:* Gordon's first edition of Checkout Chatter, destined to become a collector's item, has been included as an insert to this month's issue. Unless the postperson has discovered the premier issue of Checkout Chatter and recognized the potential collector value of this fine rag...er...ah...piece of literature, you should find your copy enclosed. Enjoy.]





Some Spellers are Better than Others.

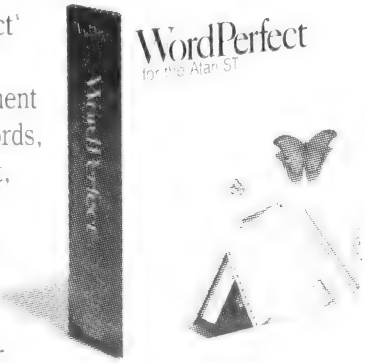
Before she won her regional spelling bee, Margaret Hollingsworth pored over seven different dictionaries for more than three hundred hours.

And while we'd all like to be champion spellers, most of us just don't have that kind of time.

So may we suggest putting the WordPerfect® Speller in your corner.

Not only will the Speller check your document (or any section of it) for errors and double words, it will instantly count the words in a document, page, or block of text.

You can look a word up phonetically to find the correct spelling, and the Speller will give you a list of replacement words with similar sound patterns. Or if you're looking for just the right word, and you know it begins with "s" and ends in "-ology," use a wild-card character to replace the unspecified letters. The Speller will show you a comprehensive list of your options.



With the WordPerfect Speller (included in your WordPerfect software for the Atari), more than 115,000 words are at your fingertips. No other speller can match that kind of power.

Not even Margaret.

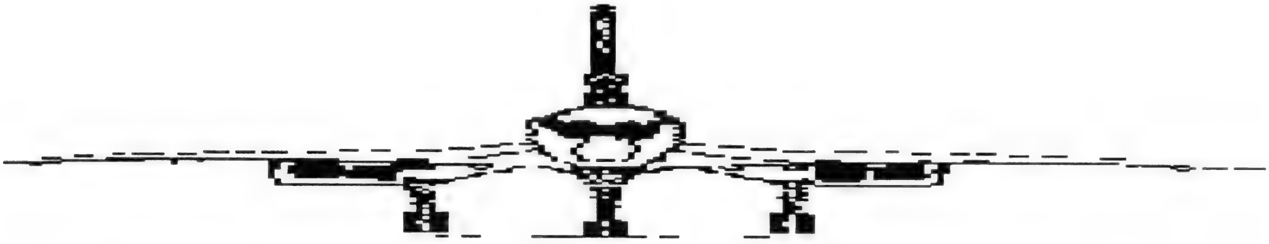
Falcon

by Ed Wehrenberg

When Spectrum Holobyte first released Falcon, an F-16 flight simulator, it was for the IBM and Macintosh. Being an ST owner, I was filled with resentment and disenchantment. I almost (secretly) wished I had an IBM just to play that game. I had seen the IBM version and thought it was awfully good.



Now that the game is made for the ST, I am glad I don't have an IBM because the ST version is so much better!

I haven't seen Falcon AT however, and that is supposed to be great. I can only speak for the ST version and in a word, it's incredible! From the graphics to the scenarios, everything in the game is top notch. It even includes a way to dogfight your friends miles away through the phone lines, if you have a modem.

The simulation begins with selecting a pilot from the roster. The roster is blank at first, but as you play it, the pilots' names stay on the roster, assuming they don't get killed in action. Merits build up for each pilot on the roster so you can keep track of how each pilot is doing. That's great if you have a spouse or a friend that plays so you can keep close tabs on how the "other guy" is doing.

After choosing a pilot, you move to the mission screen, where you choose your rank, which is directly related to degree of difficulty, and the mission.

Missions range from the "Milk Run," in which you blow up three towers with no enemies around, to flying against the best air threats the enemy can offer in the final scenario. After that, it's on to the armament screen, where you choose your ordnance that you'll take with you.

At the lieutenant (easiest) level, there is unlimited armament. You must be choosy, because taking too much can weigh down the aircraft. On the other hand, you never want to be caught behind enemy lines without enough firepower. If it sounds complicated, it's not. A bit lengthy maybe, but it's all very self-explanatory.

Finally, it's onto the runway, in the cockpit of the F-16 Fighting Falcon, one of the most lethal aircraft in the world. When flying, you'll marvel at the detail in both the ground targets, and the enemy MiGs (Russian fighter jets) that harass you. The speed of the graphics and animation is great, it doesn't bog down at all.

I can't say the same for the two-player modem dogfighting action however. It was just too slow to enjoy, but no-doubt would be enjoyable at 9600-baud through a null-modem cable.

There is way too much flight detail to cover in one article, but suffice it to say that it is the most realistic and enjoyable combat simulators ever for a computer.

It takes a few missions to learn the aircraft and how to fly it, and even more missions to learn how to successfully employ the vast amount of missiles and bombs you have at your disposal. No matter how much you practice, the Colonel level is a challenge for anybody.

I thank the folks at Spectrum Holobyte for providing an in-depth and detailed manual. It alone is worth the price of the game. Merits are awarded for each successful mission, with more merits being awarded for higher ranks.

Spectrum Holobyte thought of just about everything in the ST version of Falcon, I just wish there was enough room in this article to tell you all about it!

Computer Abuse
How to Detect it and Avoid it

by Ted Beauchamp (TAG)

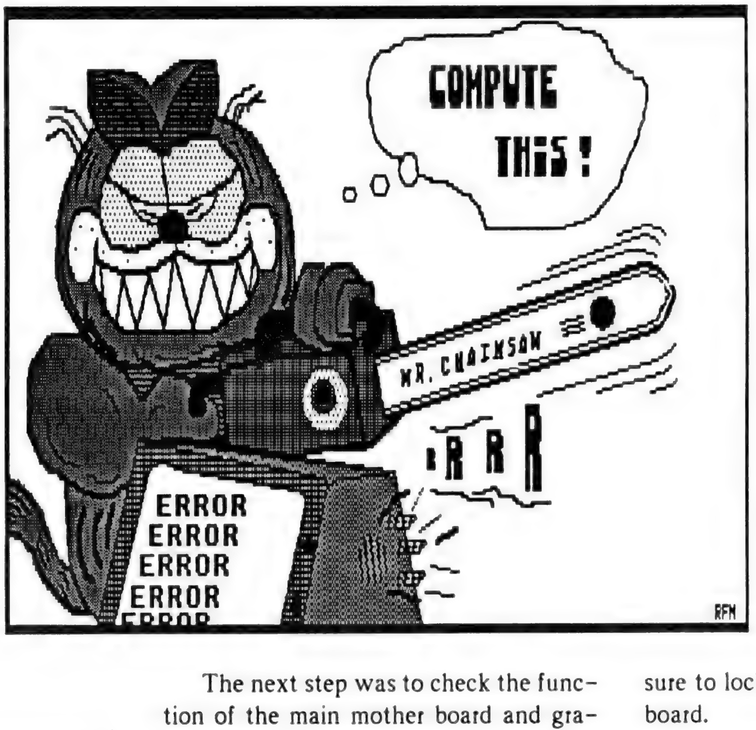
NOTE: The following is a true story, dealing with harsh realities. Discretion is advised.

A co-worker of mine was driving down a rural highway in an adjacent county when he saw a computer set out with the trash in front of a house. Being a curious person, he turned his car around and stopped to examine the computer.

He found that it was a Blue Chip IBM XT clone. The entire computer, including two 5-1/4" floppy drives, the monitor, and the keyboard, was all there.

He placed everything in his car and drove away. The next day he brought the computer into work to show our resident computer expert.

The main CPU case was bent and showed repeated stomps from a muddy boot. The front of the housing was broken around the drives but the drive door latches were ok. The monitor rattled badly when shaken and had obviously been dropped and/or kicked repeatedly until major components were broken loose inside.



Probably the most glaring example of the abuse this computer suffered was the condition of the keyboard. It appears that the keyboard was placed against the assailant's knee and bent like you would break sticks to make kindling wood. The keyboard was bent such that most of the keys in the middle third of the keyboard popped off.

If you think that this was just a case of someone taking out their frustrations on a totally useless piece of equipment that was unrepairable read on.

After prying the cover off the main CPU he found that most everything seemed to be intact. He removed the drives, hooked them to a temporary power supply and connected them to one of our company computers, both drives read and wrote perfectly.

The next step was to check the function of the main mother board and graphics card. The computer was hooked to a different monitor and keyboard and a diagnostic utility run on the computer. No problems were found.

The CPU cover was sent down to the shop floor to be straightened and the computer was put back together. Several people were interested in speculating on how or why this happened.

My first theory before seeing the computer was that perhaps the computer was being transported in a car that was involved in a bad accident.

However, after seeing the muddy boot prints on the case and the way the keyboard was bent, it was obvious that this was intentional.

The most popular theory by those asked, seems to be that the computer was a target of abuse in some sort of domestic dispute.

Perhaps the non-computing spouse of the computer's owner became jealous of the computer and decided to gain back lost attention. Perhaps the dispute had nothing to do with the computer itself, but this was the simplest way to get even.

One other possibility is that the computer suffered because of a poor software application that frustrated the owner to the point of violence.

In closing, remember that your spouse or lover needs some attention sometimes and that if you do have a disagreement make sure to lock up more than just your keyboard.

If you are a programmer, remember that the users might not always use your program as you intended them to, that would make you a personprogrammer. Also remember that ALL software needs documentation!

An Impromptu Review of Bill Williams' Necromancer

by Dick Brudzynski (CIS)

Necromancer is now available on cartridge for all XE/XL computers and game machines by Atari.

Necromancer author Bill Williams always found new ways to use a joystick. In an early APX game, Salmon Run, one had to pilot a fish upstream by a combination of jumping and swimming movements that was quite unlike anything ever seen before (or since).

In a later work for Synapse, Bill had an Alley Cat which the user had to keep madly jumping on a clothesline trying to hit a target some distance away. Unlike most "jumping" games there was an element of randomness, unpredictability and gravity in the joystick control. The player could never be quite sure of hitting the target.

Necromancer was Bill's most notable achievement in new forms of joystick control — the action was "spongy." The user would move the joystick and it would take a fraction of a second for the corresponding action to take place on the screen, the action always lagged behind the joystick movement, and you could return the stick to neutral and watch the action complete itself on-screen.

With a Bill Williams game, you knew you'd always have to learn to use the joystick in a way that you hadn't used it before -- always interesting, always challenging.

A second notable feature of a Williams game was the emphasis on romance as the object of the game. In Salmon Run, the player piloted his salmon upstream and, if successful, was rewarded by a big wet sloppy kiss from his lady fair (complete with smoochy sound effects). His Alley Cat was prompted in his adventures by his desire to impress his girlfriend. Both the Salmon and the Cat got the girl at the end of each level and were rewarded by increasing levels of on-screen bliss. I imagine that the successful completion of all the levels of a Williams game would probably result in a degree of ecstasy known only to the Finnish Commission on Eroticism and Public Health.

All of Bill's works projected a sense of joy and good humor — they were true "feel good" games.

Necromancer was a distinct departure from Bill's usually light-hearted style and the closest he's ever come to a traditional blow-the-enemy-away game. Our necromancer protagonist is charged with the responsibility of restoring light to a world from which the light has been stolen. Actually there are three games which are part of the game in Necromancer.

In the first game, we have to arm our Necromancer with the tools he'll need to successfully complete the second game. Our Necromancer must grow an entire forest to use in the second game. In the course of this process, he and his forest are under attack by trolls and venomous spiders which grow ever stronger.

Here is a really brilliant twist — a gamer who tries to counter the opposition by becoming increasingly stronger will lose badly. The correct strategy in this section of the game is to maintain and gradually diminish the Necromancer's strength so as to finally expire at precisely the "right moment" when the forest is at its most powerful. A gamer who tries to "stand against the wind" will lose his entire forest; a gamer who knows when to bend and eventually break will pass on to the second game well-armed.

In the second game, our Necromancer has an opportunity to prevent his adversary (an evil mage) from arming himself (with more venomous spiders). The goal is to use the trees to prevent the adversary from hatching spiders from five levels of crypts. Each spider prevented from hatching denies a tool to the adversary in the third game.

All five levels are basically the same game but as the gamer progresses through the levels, he has to learn precisely when to change strategies in order to preserve his forest and diminish the evil mage's minions to the max.

In the third game, our necromancer faces a duel to the death with the evil mage. In this game, Williams presents the gamer with a difficult problem to solve. The necromancer is under constant strength-diminishing attacks by the mage's minions. He can reduce the attacks by attacking the minions. He can regain strength by attacking the mage. He can progress to the next level by attacking the mage's hiding places.

The trick in the third game is to find the right combination of attack-the-minions, attack-the-mage, and attack-the-hiding-places so as to pass onto the next level with the maximum remaining strength. This is a problem I've been unable to solve despite years of play. Knowing Williams' style, I keep playing because a real graphic treat awaits the player who successfully completes the third game.

A Bill Williams game is always distinctly different from anything else. Describing it is like trying to give a narrative description of a Beethoven symphony, the Mona Lisa or a first kiss. Atari deserves to be commended for bringing Necromancer back from the grave.

From time to time I wonder whatever became of Bill Williams. I like to think that Bill is still hacking away out there somewhere. By all means, pick up Necromancer. It's truly a unique creation that will stimulate brain cells near death from too many mazes, shoot-em-ups, jumping games, etc. By the way, the graphics, music and sound are impressive.

Batman, The Caped Crusader

by Bill Boles (MACE)

With the long-awaited Batman movie slated to hit the theaters in June of this year, it seems that people are going bat-crazy and various companies are jumping on the bandwagon, producing T-shirts, posters, games and other promotional items, not to mention a rise in sales of Batman comic books (finding a back issue with the Joker in it is almost impossible). One would imagine that the folks at DC Comics are very happy.

Now Data East has joined the race for bat-bucks with the release of Batman, The Caped Crusader. However, this game is no cheap attempt to make a quick dollar or two; this is a nicely done program that features excellent graphics and playability. The game comes on two disks (actually, each disk is a separate adventure).

In disk one, "The Penguin: A Bird in the Hand," the Penguin has set up a seemingly honest business as an umbrella merchant, but his real plan is to take over the world with an army of robot penguins. Your job: stop him. The game begins in the batcave where you must collect items to repair the Bat-Computer. Once this is done and you find your way out of the cave, you find yourself outside of some buildings. As you walk along collecting various items that are needed to complete your quest, you will be attacked by the Penguins thugs who, when beaten off, will drop a packet of food which you can eat to replenish your energy level (represented by a picture of Batman's face which slowly changes to a skull).

By pulling down on the joystick and pressing the fire button at the same time, a status/activity screen will appear. This screen is used to keep track of items found and to use those items by selecting one of them and then placing them in the "use object" icon. This screen also contains the energy level indicator mentioned earlier.

Soon, you will find the Penguin's warehouse. This is where the game gets tough. Not only do you have to deal with the thugs, but now you are under attack by toy airplanes that bump into you and robot penguins which open up, revealing a gun that shoots at you. The penguins are easy enough to destroy, but as of yet, I have not figured out what to do about the airplanes. This sort of thing continues until you have captured the Penguin (something I have not yet accomplished), and brought him in.

In disk two, "The Joker: A Fete Worse Than Death," the Joker has captured Robin and is (Holy Hostage!) holding him for ransom. This second adventure begins in Gotham City Park where you must find your way into the city sewer system and eventually to the fairgrounds where the Boy Wonder is being held. Basically, this adventure plays the same way as the other except the thugs of the first game have been replaced by fat killer clowns, and the sewers are populated by vicious rats. Some parts of the sewers require that Batman wear a gas mask or suffer a sharp drop in his energy. If your energy runs out, you die, and so does Robin.

I wish I could tell you more about this adventure, but I have not played it much due to the fact that I have become obsessed with beating the Penguin first. This is a very enjoyable program. The graphics and animation are excellent, and the playability of the game keeps you coming back to try it one more time.

The only complaint I have is that when the game is loaded in, the drive keeps running and has to be shut off before the noise drives you buggo (you'd think they could have put a command in the program to tell the drive to shut itself off). Other than this slight problem, I would not hesitate to recommend this game to any ST'er. "Robin...to the Batmobile!"

For 520ST. 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.
Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A: Socketed, no RAM	$ 129
520B: 1 MB, socketed	$ 249
520C: 2.5 MB, socketed	$ 495
520D: 4 MB	$ 795
520-1: 1 MB, non-expandable	$ 199
1040A: 1 Bank sockets, no RAM	$ 110
1040B: Fully socketed, no RAM	$ 149
1040C: 2.5 MB + 1 bank sockets	$ 495
1040D: 4 MB	$ 795
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 3-22-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.
Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available!
Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Space limitations don't allow a more detailed description. For complete catalog contact:

Cascades Atari Computer Enthusiasts
CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Atari Interface Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

Fishin' Around by Brent Fisher

Greetings and Salutations to all of you out there in Atariland. This month's newsletter offering is going to look a bit like January's I am afraid, since it seems all of the writers for this end of the publication have taken leave of their keyboards and gone out to party for ST. Patrick's Day (whoever heard of putting a deadline on the biggest partying day for green beer anyway). Though I was able to drag Jim Boyce away from his bar stool for a few sectors of AW+. Speaking of Jimmie's AtariWriter+ column, hopefully we will be getting it all set up so that Unicorn Publications can finally start reprinting it for their larger audience.

Well, on to the news for this month. MACE has sent out their information packs and we, as a lucky user group that is know to them, have received one. In it they describe the show that they will be putting on in Romulus, and also what sort of discounts that group members who show that they are part of a user group will be allowed to have. If you group members reading this are interested in going to what I think will be a great Atari show, please contact me or Craig for more and better details, especially about the discount tickets and the gold card plan. By the by, the show is to be held on the first weekend of May or in other words, Saturday and Sunday May 6th and 7th.

Now for some news on the other Detroit Atari show. If any of you have been reading Zmagazine (what do you mean you haven't been downloading it from the C.A.C.E. BBS, the number is 787-4011, add a 1-517 for those of you who are reading this in other than the Jackson area) you will have heard of the World of Atari shows that will be touring the country. The first stop will be in California in April and the next stop will be in Detroit in June, said to be on the weekend of the 24th and 25th. So if you are an Atari fan this looks to be your summer to enjoy some local Atari support from the big company itself.

Since you all have been so kind to read this column to this point let me inform you our next meeting date on April 9th at 1pm sharp so don't be late, we will probably run it to 4pm or so as we have to last couple of months. We will be converging upon the East Side Lounge in beautiful, lovely Jackson.

CAPITOL HILL ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

Things have been pretty exciting here in Mid-Michigan. We're pleased with the reception our new Great Lakes Atari Digest has received. By incorporating the Z-Net Atari newsletter supplement, we're able to offer some of the most up to date news available. The Z-Net portion looks great. If you're an Atari club and you're not on our exchange list and would like to be, drop me a line. We're in the midst of preparations for a plethora of computer shows. MAXIT is taking place at the Clarion Hotel here in Lansing on April 9. The MACE show is at the Airport Hilton on May 6 and 7. And the World of Atari show comes to the Dearborn Hyatt Regency on June 24 and 25.

GENESEE ATARI GROUP
Serving the Flint area

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Inc.

GAG meets on the second Wednesday of the month at the Neithercut school, located at 2818 Crestbrook Drive, Flint. (Off Atherton between Hammerberg and Van Slyke). Meetings begin at 6:30 pm. All are welcome. GAG is a participating member of the Atari Interface Magazine, and members can purchase subscriptions at a greatly reduced rate. GAG is also affiliated with the Great Lakes Atari Digest, and members receive a free subscription with their membership. Membership is $15 per year for the family.

GAG has an exceptional public domain library of 8- and 16-bit software. Contact one of the officers to receive a complete catalog. GAG also has a large magazine library for use by it's members, including Antic, Analog, ST-Log, Start, and several others. We do not support piracy, Piracy is theft!

For more information contact:

ST Librarian murmurings Gil Merciez

Available in April will be a catalog disk of the entire ST library. I ran across a program from the Milatari Group which catalogs a disk library by both disks and individual files. This disk will be available for the normal $3 charge. This disk will be updated monthly, however, and you can receive the latest update by simply returning your original disk at a GAG meeting. There will be no additional charges after the initial $3 charge. Thanks go to Jack Keene, our assistant librarian, for preparing this disk.

In an effort to bring a better value to GAG members you will notice that more new disks that appear in the library will be on double sided disks. In the immediate future most of the games disks and utilities disks will remain on a single sided format. The single sided disk drive is no longer being sold with the 520 ST and the 1040 and Mega's have always been sold with double sided disks. If you are one of the few ST owners who own only a single sided drive, the handwriting is on the wall. Arrangements can be made, however, to purchase many of the double sided disks in a single sided format. See either Jack or myself for details. There will be a $1 charge to cover the cost of the extra disk.

In April look for an additional couple of clipart disks as well as an astounding digitized sound demo (38 seconds worth) of an extracted guitar solo from Pink Floyd's "The Wall" album. With the gradual conversion to double sided disks you may find that there will not be as many new disks per month, but the volume of programs will not change.

President's Report

As many of you know by now, there will be a huge Atari show held in Dearborn, put on by ST-World. Both GAG and CHAOS are involved with the show, and have promised to do whatever we can to support it. So...

You may also have attended one of the past AtariFest shows held in 1987/88. If so, you recall that there were computers everywhere in the convention hall! There were one or two in each booth, plus a whole bunch that were being used for the MIDI-MAZE game. Where did they come from?

Well, back then a few were brought from the individual companies, but the vast majority were supplied by Atari. Sadly, they are all gone, sold to the famous "highest bidder". So, those folks attending any of the future AtariFest's or World of Atari shows must now fend for themselves and supply their own computers. Well, the clubs are being asked to lend some of the vendors their own personal computer equipment to use during the show. Yes, I know how much that computer means to you, and how reluctant you are to part with it. But this is our chance to show the vendors that user groups are willing to help out.

Call Jerry Cross at 736-4544 and let him know what equipment you can let the vendors use. The day before the show arrangements will be made to pick up your equipment and check it to be sure it works properly. After the show it will again be picked up and inspected. If anything should turn up missing or damaged, ST World has guaranteed to repair/replace it. That's it! So please think about it.

GKAUG GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets on the second Saturday of each month at 11 a.m. in the Dewing Hall, Room 305, on the Kalamazoo College Campus, corner of Academy and Monroe. Dues are $25/yr and include a subscription to Atari Interface Magazine.

President	Frank Fellheimer	657-6106
Vice President	Dan Youngs	
Treasurer	Dave Bryant	
Librarian	Dale Vincent	
Archiver	Dave Oldenburg	
SysOp	Alex Stevens	
GKAUG BBS		(616) 657-2665

Next meeting of GKAUG will be Saturday, 08 April 89 for those of you who may have noticed that I did not get an article in the AIM magazine last month. Sorry... I was on vacation in DisneyWorld, enjoying the sun.

Our monthly meeting was a pretty good one. We tried to demo "No Frills" Print Shop Utility Disk, and the converter. We only had one monitor that we could use this time so it was somewhat cumbersome to show since I really couldn't see what I was doing most of the time...nothing new I suppose.

We also demoed "Text Pro" an excellent word processor and available to our membership.

Bob George brought his ST in along with his 64Meg hard drive. He built this baby on his own, and its a real beauty. We got some real insight on the importance of a mouse in computing when we tried to load an 8bit emulator into the ST and run a couple of programs...what really happens when a computer "locks up"???

Dave Bryant is retiring from his treasurer position and we are currently looking for someone to take over his duties. Not a hard job really... call me, we have "Perks". Bill Berner will be taking over the librarian position from Dale Vincent when Dale decides to move to Florida. We have enjoyed his participation in the Club. Thanks Dale.

Alex Stevens is still making various modifications to the BBS and is doing a fine job. He is adding a couple of on-line games, so this should give you something else to occupy your time. We will also be adding another drive to the system so there should be more room to up/down load programs.

Next month:

1. ANALOG #71
2. PS UTILITY DISK
3. CONVERTER COMPANION
4. CONVERTER UPGRADE

There has been some discussion of changing the time of our meeting (AGAIN??). We can do what we want with this... give me some INPUT!

Frank Fellheimer

Great Lakes Atari ST Support 'GLASS', Michigans only 'ST' only Users Group I ♥ my ST!

Meetings - First Thrusday every month, 6 p.m. to 9:30 p.m., Athens High School, 4333 John R, Troy, Mi., 1/10 north of Wattles <17 Mile> - Room 1528 - Mailing Address - P.O. Box 99737, Troy, Mi. 48098 Phone - (313) 828-1653 after 4 p.m. - Steve Mileski, president

Dues - $1.00 per month, ie:join in April - pay $9.00, all memberships expire on January 1, each year. Non-members welcome at no charge.

GRASS
GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

Next Meeting: 6:30 P.M. Wednesday, 3 May 1989. Wyoming Public Library. 3350 Michael S.W.

Tim Feenstra	President	(616)784-6230

George Nosky	Treasurer	(616)942-1527
Bob Bulliment	Secretary	(616)457-1766
Chuck Baughman	Librarian	(616)795-7373
Terry Reine	Membership	(616)698-7244
Gary Heitz	Director	(616)676-0112
Gerry Borysiak	Director	(616)896-9358
Charlene Bird	Director	(616)795-3593

President's Monthly: 17 March 1989

Those great folks at ICD have done it again. This time they are giving us a great deal on US Doublers, a modification that will give the 1050 disk drive true double density, and ultra high speed I/O when used with Sparta-Dos. If you missed the meeting, and you want to get in on this order, call me today. I'll be ordering them in time to give them out at the May meeting.

Speaking of May, at the May meeting the use of local BBSes will be demoed using the VCR method that worked so well for Genie. There will be a Modem up for raffle at that meeting, so you won't want to miss it.

By now you should know about the Atari Fair in Detroit in May. I plan on attending, and hope we can find a couple members who own vans or station wagons that would like to take other interested members to the fair. If you would like to attend the fair, and have not signed up, let us know as soon as possible so we can line up enough transportation.

Greg Williams and I have had a couple conversations about the formation of little sub-groups with mutual interests, or perhaps a second, informal meeting to do the things there is not time to do at the regular meetings. If you have a comment or suggestion about this just pass it along and we'll see what we can do.

Lastly, I would like to pass along a few opinions about public domain and shareware software. The past few weeks I have been trying to get switched over to SpartaDOS and have been very hesitant about changing the DOS that comes on commercial software. I would rather put these disks in the closet then take the chance of hosing them up beyond repair. So now I am looking for public domain and shareware programs to fill the gaps left by the commercial products. The search was not long, as I found almost everything I needed right in our own club library. I now have a disk with all the programs I need to keep up with the clubs work. Textpro is a very good word processor (I am writing this on it now), and I even found a spell checker (which I have not tried yet) that should work with it. I have used Express for communications for a couple years now, and it works fine with SpartaDOS. There are lots of different databases, appointment calendars, and notepads to be found.

I do not intend talking anyone out of purchasing a good program (the few companies that support 8bits should be favored) if the program is what you want, but for many of those obscure needs, there are usually several public domain programs that fit the bill. Check out your library catalog for the programs you need, I think you will be just as suprized as I was at the wealth of quality useful programs that are there for the taking.

Come to the May Meeting!! Good Computing! Tim

M.A.C.E. M.A.C.E.
MACE
MICHIGAN-ATARI-COMPUTER-ENTHUSIASTS

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)
MACE East	(313)978-1685	(3/1200)
The College Board	(313)478-9647	(3/12/2400)
DownRiver Outpost	(313)675-4660	(3/12/2400)
Molin's Den	(313)420-0407	(3/1200)

The February general meeting was a bit of a snafu... Somehow the management of the Southfield Civic Center relocated us to another, smaller room without notice. Amidst the din and confusion, members who had arrived with boxes of goodies for the Swap Night started setting up and displaying their flotsam. By the time any sense of organization took hold, many people had already left and so a "General Meeting" was never convened.

The next meeting will be held on 3/21. The feature topic will be Spread Sheets and Taxes.

Michael Olin, MACE Rec. Sec'y

Miscellaneous Tidbits

MACE needs your help with the Michigan Atari Computer Expo. If you can donate four hours of your time to MACE for the show, you are eligible for a Gold Card, which gets you lots of discounts on merchandise at partipating exhibitors. MACE needs people to take and sell tickets, hand out brochures and generally be helpful to exhibitors. Please call Pattie Rayl at (313) 973-8825 if you can help.

MACE will be raffling off SoftLogik's PageStream at the April 18th meeting, whose feature topic is discussion of final arrangements for the Expo. The May 16th meeting is MACE's Birthday Party. There will be lots of goodies to be had at this meeting, so be sure you're membership is current and join us there!

MACE has received a letter from a Mrs. M. Hamlyn in England wishing to correspond with fellow 8bit Atarians. If you'd like to write to her, she can be contacted at 37 Sedgeley Grove, Elson Gosport, Hampshire, England PO12 4NL.

March General Meeting minutes were not available at deadline for printing in this issue and will appear in the May issue.

TINKER ACE OF OKLAHOMA

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at PO Box 7697, Moore, OK 73153 or at the TACE BBS (405) 793-7980, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Correspondence - $15.00.

President	Michael Beard	(405) 793-7978
Vice President	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Greg Yelle	(405) 390-9184
BBS SysOp	Michael Beard	(405) 793-7978
Technical Advisor	Ron Hamilton	(405) 387-5649

The View from HQ by Michael Beard

Welcome to our new monthly newsletter. Due to circumstances beyond our control, TACE is not able to financially afford to continue receiving the Puget Sound Atari Newsletter magazine, that we have been for the past year or so. At our last meeting, the members present voted to switch to the Atari Interface Magazine, AIM, which you are now reading. Anyone wishing to continue receiving PSAN in addition to their AIM please contact myself or any of the listed Officers for information.

The TACE BBS is now running a Beta-test version of Oasis 4.3. It features full ANSI/ST VT-52/ATascii/Ascii/Commodore color/graphics! That's right, color menus/prompts for IBM users, ST users and Commodore users, as well as ATascii graphics for 8bit Atari users, in addition to ascii for Apple and other "plain" ascii computers. New Teen and Adult SIGs on the BBS. Give it a call at the listed number!

Many thanks to the Rayls for the help in getting this changeover set up as smoothly as possible. I also want to take this time to express my deep felt gratitude to Jim Chapman of PSAN for his superb work on the PSAN magazine and his support in the past. I sincerely hope that he understands our reason for changing to AIM and that we can continue to work together to support Atari in any and all ways possible. THANKS Mr. Chapman!

Secretary/Treasurer Report — March

In case you have not noticed, the club has decided to switch over to Atari Interface Magazine, which used to be the Michigan Atari Magazine. The reasons for this are many. PSAN, which is a very good magazine, had upped their price to $1.10 an issue per person. This would make it necessary for the club to have 36 members to break even (because of the BBS and other expenses). With AIM (the magazine you should be reading now) we had to pay only $.85 an issue per person, needing only 25 members to break even. We have, at present, only 35 members in the club. We were not even breaking even with the current magazine.

The magazine you should be holding in your hands right now is a high quality magazine published by an independent publisher called Unicorn Publications. It has a BBS specifically for receiving submissions. All in all, it was felt it was a prudent move. If, however, you wish to still receive PSAN, you may subscribe to it through the club for $1.10 an issue (you may also subscribe to Current Notes through the club, please contact Michael Beard for further information).

It should be noted that all submissions should be in by the 17th of the month in order to make it into the next month's magazine, and the decision to go with AIM magazine was not unanimous, but was a majority decision. Remember, this magazine is included with your club dues, also the BBS is included.

It has been noted that South Western Bell has advanced the notion of charging BBSes in the area a business line charge. As a result of this, TACE will no longer be offering a "BBS membership," as charging for the use of the BBS in any way would cause us to be a "business" and therefore have to pay business rates.

The following librarian positions have been deleted: PC-Ditto, Macintosh, and CP/M. The ST librarian position is currently open.

We received a cassette in the mail recently from Poland (with an offer to sell us the publishing rights...

Also, an offer. If you pay $10 now, you may receive a free disk of the month at every meeting for a year. That reminds me. The disks of the month list is quite extensive, so here goes:

From Patnor Enterprises, P.O. Box 370782, El Paso, TX 79937: "Disk 33-Side I(Games/Recreational)"

Panic-combines typing practice with a fun game. Antiship-sink as many ships as you can. Roundup-gets those cattle into the corral. Targets-target shooting. Hangman-a good version. Lunar Lander-descriptive title. Pac Invaders-version of the game. Bee-animated flight. Reverse-get the numbers in proper order. Castlehex-rescue the Book of Known. Santap-how well can you rule the Kingdom of Paravia.

"Disk 33-Side II(Games/Recreational)"

Jackpot-slot machine. Tiger-get the doctor to the boat past the man-eating tiger. Arty-artillery practice. Lander-on Mars, Earth, the moon, or Vesta.

Wordguess-just that. Puff-puff-the magic dragon. Filerup-Qix like. Grubs-get 'em before they escape. Pokersquares-a different way to play poker. Yahtzee-a dice/card game.

"Disk 57-Side I((Games/Recreational"

Ionpower-pinball game with great graphics, requires 2 joysticks. Eggsnatch-from the ants. Caves of Ice-can you escape fast enough? Motie-strategy capture game. Big Boggler-a word game. Music Flash-flash card to teach you to read music.

"Disk 57-Side II(Games/Enertainment)"

Jellyfish-eat the organisms without the pink jelly fish getting you. Paratroop-shoot 'em. Requires paddles. Slots.002-slot machine. Lumarmis.002-lunar landing simulation. Space Cavern-zap creatures to get to the next room. Speed Demon-get around the track and avoid the pot holes. Tricky Track-a not so easy racing game.

"Disk 59-(Games/Recreation)"

Includes a special load menu. Speedski-slalom, watch the trees. Cosmic Defender-avoid spaces debris and alien ships while maneuvering through space portals. Avalanche-Q-Bert like. Space Race-2 players, many options. Popcorn-catch them-get promoted or fired. Bombers-score points against the computer, or a second player on bombing runs. Mazewar-zombies and wizards at war in a maze. Up to 4 players can compete.

"Disk 60-(Games/Recreational)"

Two Gun-shootout between you and the computer, or between you and another. Bonk-(binary load file) collect diamonds while avoiding alien attackers and wall. Incoming-defeat incoming space ships and helicopters. Roto-collect gold in space caverns while not allowing power pack to run down. Money Hungry-Pac man flavor. Firebug-get the fire bugs before they get you. Is fast. Good graphics. Elevator Repair-get to the top and repair the elevator. Good color usage.

"Disk 93-Side I(Applications)"

Index-user friendly disk cataloging system. Well documented. Eztype-redefinable keys to type pre-designated strings of characters. Documentation. Fonts-14 of them.

"Disk 93-Side II(Applications)"

Board-prints graphics 7,8 & 9 sideways, or upright(printers not stated). Orbits-compute various orbits for the different planets. Instructions. Disklib2-disk indexing system. Gas-gas piping system for various requirements.

"Disk 96-Side I(Games/Recreational)"

Football-a basic football game. You against the computer. AdventureX5-text adventure in space. Can you safely leave planet Klybex-7? Santa-great game. Help Santa deliver the goodies down the chimneys, or land on the rooftops to get down the chimneys. Various threats.

"Disk 96-Side II(Games/Recreational)"

NFL Football-all team statistics. Most plays available. Very good simulation(most likely no graphics).

"Disk 81(Educational)"

Word Builder-for 2nd through 8th grades. Designed to build word skills.

"Disk 92(Educational)"

Various files.

"Disk 106-Side I(Games/Recreational)"

Blue Thunder-fly helicopter through various defenses to rescue prisoners and return them to safety. Letter Quest-decipher the words. Mouse Trap-a runt-time Action game. A superb game. Startrek-can you conquer the galaxy for the Federation?.

"Disk 106-Side II(Games/Recreational)"

Empire-you are the emperor of an empire. How will you run it? And so on. Pachinko-Japanese parlor game.

"Disk 139-Side I & II(A Potpourri)"

Dragonquest 3.14-graphics adventure. A maze of spooky caverns in search of treasure. Infiltrator-text adventure. Limited number of moves to infiltrate and destroy energy center. Isle of Bonita & Mary's Prayer-2 AMS songs. Black Hole-pinball game. 1 to 4 players.

And from C & T ComputerActive, P.O. Box 893, Clinton,OK 73601: "PD006-Game Disk #6"

Number Battle, Showdown, Tank Battle, Dog Fight, and more. A routine to create a game menu.

"PD007-Game Disk #7"

Gauntlet-M/L 48k planetary attack game. 50 screens, 17 types of enemy ships with 10 types of weapons. Snowball-2 player M/L snow fight. Norad-simulates breakin into NORAD. Xevious-another M/L game.

"PD077-C.U.B.S. EdPack #1"

Math programs plus World Geography and 2 USA states and Capitals lessons.

"PD085-Astromony & Meterology"

Various files.

"PD203-Game Disk #23"

Squirm.OBJ-create a path for the shuttlebug. Mushroom.OBJ-centipede-like. Clown.BAS-make sure the clown does not fall. Baloons.BAS-shoot the baloons. Tightrope.BAS-walk the rope. Quester.BAS-text adventure. Prochess.OBJ-a chess game for pros.

"PD204-Game Disk #24"

Mosiacpz.BAS-a puzzle to solve. Tag2.BAS-2 player game of tag. Tank.BAS, Dungeon.BAS-second one is a text adventure. Spyplane.BAS-stop the production of enemy killer satelites. Spyplane.DOC, Dragon.BAS, Prison.OCT, Spaceray.BAS.

That is finally that. 'Til next time. Stephen C. Moffit

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the second Saturday of every month at 2 p.m. at the Rudy Zauel Memorial Library on the corner of Shattuck and Center in Saginaw. Upcoming meetings are scheduled as follows: April 15, May 13, 1989.

LeRoy Valley	President	686-6796
Marty Schmidt	Treasurer/Secretary	792-6029
Al Jennings	ST Disk Librarian	790-1980
Ted Beauchamp	8bit Librarian	686-8872

Club dues are $20.00 per year. For this fee you get the Atari Interface Magazine, support for both the 8bits and ST's, and full access to the clubs public domain library. We currently have 150 8bit disks and 50 ST disks. 8bit disks cost $1 each, and ST disks cost $2 each. Check your mailing label. If you need to renew or you haven't even joined yet, then do it now!

STill to Come!

The month of May will find TAG in HOLLYWOOD!! Er, that is, TAG will see a program that allows you make your own movie — just like in Hollywood. Steve Volker will be demoing Art & Film Director by Epyx. This program offers new and unique features for creating art masterpieces! It even has extensive animating features! Show up and see this exciting new program! (P.S., Steve is EXCELLENT at manipulating graphic programs, so this demo should be exciting.)

The eightbitters will be demonstrating how to transfer files between a Radio Shack laptop computer and the Atari 8bit computer. Gerry Reno will be showing users what type of cable is needed, and also the software that is required for the transfer!

RelicST to Relish!

The ST meeting was filled with new goodies and software! LeRoy started by showing us his Tech Specialities 80 MB hard drive. This beauty has two Seagate ST-251's packed into a case only slightly larger than the Supra 20 MB hard drive! The kit (from Tech Specialities) comes complete with the case, power supply, ICD host adaptor, SCSI card, and hard drive. A 40 MB hard drive is only $750! And you can add a second hard drive at any time!

LeRoy then demoed his new Mitsibushi mulitsync monitor. This monitor lets you display all three of the ST's resolutions on ONE monitor. Color looks as good as (or better than) the original JVC monitor from Atari, and Monochrome looks excellent! Plus, this is a 14 inch monitor. Compare this to the standard 12 inch monitors! The goodie that LeRoy used to connect this GEM (pun intended) to the ST is called the Synapse and is made by Void Productions.

After LeRoy finished making us drool over all this new (and impressive) equipment, we moved on to the demo of the Spectre 128. This neat little goodie from Gadgets by Small lets you run Mac software on your ST! Not only that, but it runs it 20% faster than a real Mac! If you've ever seen a real Mac with that pitifully small screen, then you can really appreciate what a 14 inch screen would look like. Everything that LeRoy ran worked smoothly and was QUICK!

The Spectre 128 can be had for $140 (from LeRoy), and the Mac ROM's (required!) cost $75-$100. The best comment from the club was "Boy, it sure is spooky seeing that MacIntosh welcome screen on an ST!".

Pieces of Eight By Ted Beauchamp (TAG)

The review for this month was a program published in Compute! in 1985, called The Home Financial Calculator.

The program will calculate future worth of investments with different deposit and interest conditions. The program will also calculate loan schedules for long or short term loans. While I have seen several programs that do this, this one has more options available than most of the other ones. There are five separate investment options available such as Future Value with Periodic Interest or Future Value With Cash Flow, etc. Under the loan menu you will find five options from Regular Loan Payments to Single Payment Loan.

Not only can you find the payment amount of a loan, or the final net worth of an investment but the program allows you to solve for other factors such as the interest rate required to reach a certain amount in a certain time with your initial investment.

Another feature that is useful is the ability to rerun the calculation after changing one variable. The program will redo the calculations so you can compare the different in the results.

The program also has a built in calculator with one memory. You can store the results of any manual calculations in any of the variables that the program uses or recall any of the variables and use the calculator functions on them, such as dividing a monthly payment into weekly amounts to fit your budget.

The program to be reviewed next month is the Syncalc spreadsheet program. We would like to have someone with some actual experience with this or another spreadsheet program there to show the practical advantages of using a spreadsheet.

Equipment volunteers for March:
Neil Demo 520 ST and drive
Steve Volker Color Monitor
Ted Beauchamp 8bit Computer and disk drive
Hank Kaufmann Monitor

Remember, if you're bringing equipment, please bring all of the necessary cables (such as power cords, monitor cords, mouses, etc.).

The March '89 general meeting of the Washtenaw Atari Users Group was held on Tuesday, 3/14, at State Street Computer in Ann Arbor. The meeting was called to order at 7:50pm by President Jon Brode who announced the feature topic would be DATABASES.

There were several new faces at this meeting, and several "old" faces which haven't been seen in awhile. A WAUG welcome to Mark Chaffee of Farmington Hills, Cletus Haines of Tecumseh, and Lisa and Doug Burns of Ann Arbor who joined our happy "family" of Atari afficionados; and to Harry Price who, on remembering that WAUG is still the best place to be on the second Tuesday of every month, renewed his long-standing membership.

ST Librarian Russ Crum announced that his Disk of the Month included no less than three public domain database programs and related support files.

Member Bill Rayl, officially representing MACE, spent several minutes discussing plans for the upcoming Atari show MACE is co-sponsoring with Atari Corp. Bill announced the show dates and location, and described some of the discounts that have been arranged for user group members, with additional discounts available to those persons who take part in performing some of the labors of putting on a show of this type. Bill noted the show is being "geared as a User Group Show, and not just a vendor-oriented show."

Anton Malje demonstrated a database program for the 8bits that maintains circuit diagrams for electronic "home-brew" projects, and was followed by Mike Millage's demonstration of Software Inventory Organizer which Mike uses to maintain information about his 8bit disk library.

Russ demonstrated Regent Base on the Mega, and also some quick samples of the programs on the Disk of the Month.

The meeting lasted until about 9:45. The next meeting of WAUG will be held on April 11, the topic will be printers, May 9: Education, June 13: Elections and Flea Market.

Stopping Computer Piracy

by Sledge Hammer (Michigan Atari Group Not Usually Mentioned)

Hello, I'm Sledge Hammer, the President of Sledge Hammer Hardware & Software. I was appalled when I saw Tim Sharpe's article in my copy of Atari Interface Magazine on the volume of computer piracy. Computers are being stolen. People are being slapped in the face with fish. It's disgusting. I decided it is time to fight back.

I started my quest by dedicating all our resources towards solving this epidemic problem. First, we started by studying the most commonly used anti-piracy techniques. Testing soon showed these simple low cost methods (exotic disk formats, add-on hardware devices and such) are too easily foiled by ingenious pirates. Research stopped, waiting for new concepts to develop.

The answer came to me one day while I was target practicing by I-94. Violence is the solution. Trust me, I know what I'm doing. My new concept: Inflict severe pain with extreme prejudice whenever one of these sleezeballs tries to pirate or plunder again. After I posted bail, I called a meeting with the people in R&D to explain our new tactics against piracy.

In just days, our R&D department was turning out prototype solutions which could stop these scumsucking pirates dead in their tracks. I personally enjoyed the monitor with the top mounted revolving machine gun. When activated, it would mow down anything within 30 feet. These new anti-pirating tools had one flaw. If they were accidentally tripped, the innocent operator would be killed. This was unacceptable. I issued an executive order to R&D. If there is a chance innocent people would be injured by one of our products then I want to be darn sure that same product has the capability of taking out enough people to insure one of them had to be a pirate.

After a tremendous decline in the number of employees working in R&D, they found the solution. Here's how it works. All our hardware now comes with special software which asks your name, age, height, weight, favorite color, and shoe size when you boot up your system. After the information is entered, the computers checks to see if it is correct. If the information is not 100% correct, our software tells our hardware a pirate is probably using your system. The reactors are set to the "uncontrollable runaway mode," (If you read the April 1988 issue of MAM you know we power all our hardware products with tiny nuclear reactors.) which results in a catastrophic nuclear explosion. The result: You've just stopped a pirate dead in his tracks.

Now you can help fight piracy by using our hardware. It's simple. Just use our products as you normally would. Within the year, with your help, we will have removed every computer pirate from existence.

Just a couple warnings:

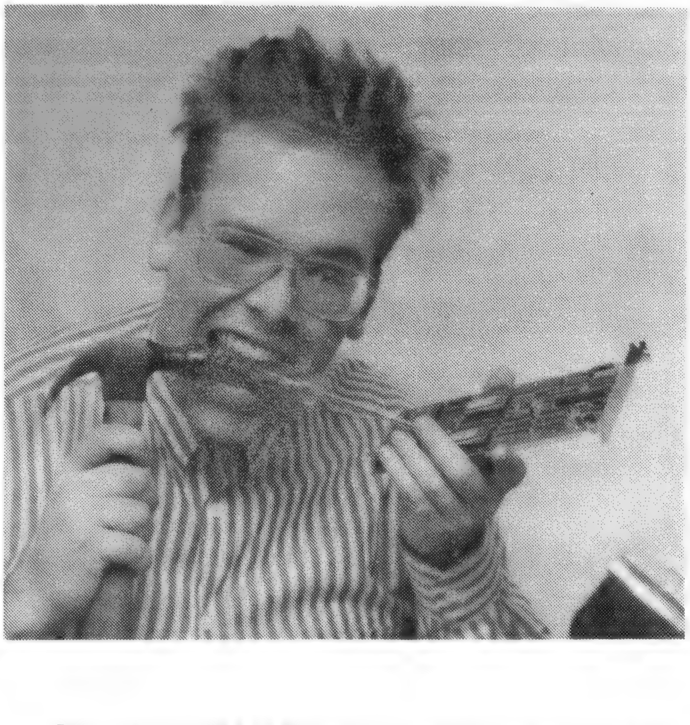
1. It's not wise to let friends or family use your computer with our hardware. They may make a mistake answering the questions.

2. Be very careful when entering your data into our system. We've learned from studies pirates don't make the same mistake twice, so we don't give them a chance by disallowing any changes in answering the questions.

Even, by chance, if you make a mistake signing on, the area of complete destruction is so large you're likely to take out at least a dozen or so pirates within a hundred mile radius.

So watch for the signs. If your computer gets fried by an electromagnetic pulse, you see a mushroom cloud in the distance, or you witness an eerie glow beyond the horizon that won't go away, then you know one of our products has just eliminated a pirate from the face of the Earth.

Here at Sledge Hammer H&S, we know what we're doing.



Our Capable R&D Director Demonstrates the Painstaking Lengths We Go To in Order To Produce Our Hardware Products

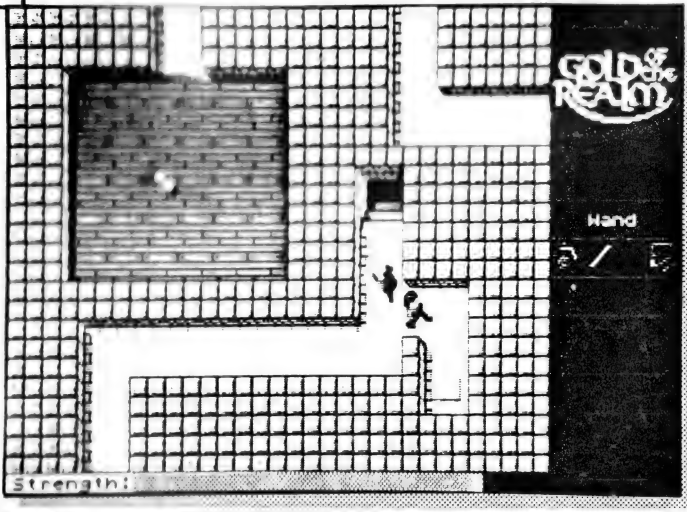
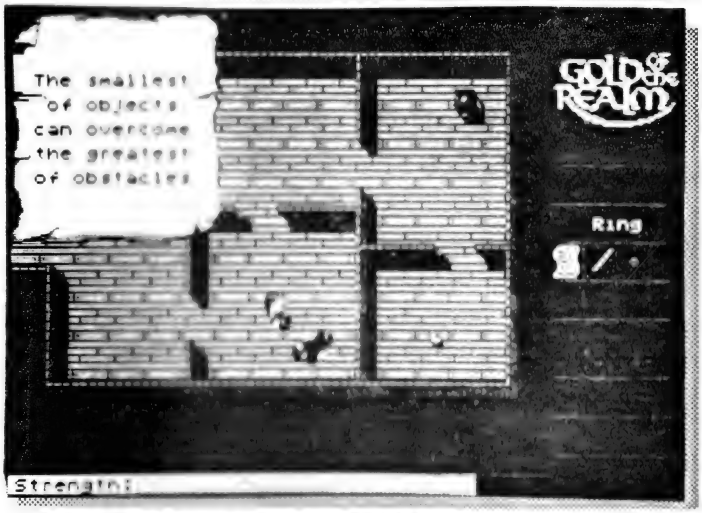
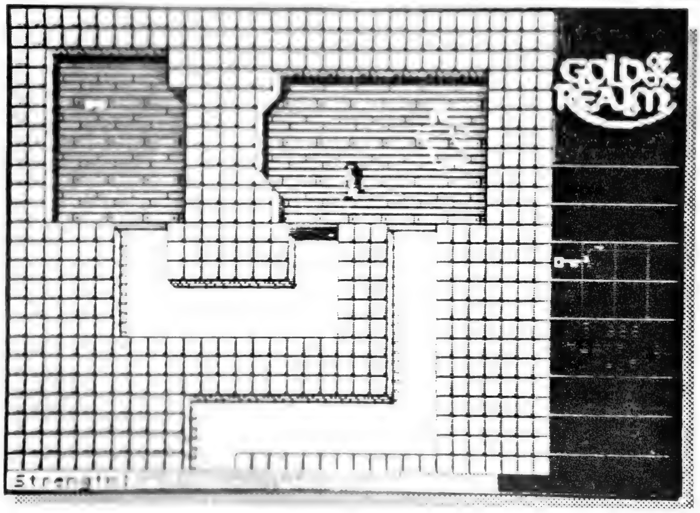
GOLD OF THE REALM™





The smallest of objects can overcome the greatest of obstacles



Somewhere within the castle's twisted corridors and dark passages lies the Gold of the Realm. Guarded by wizardry and mysterious foes, the legendary treasure is yours *if* you can find it. Within the Realm, you will find clues and objects to help in your quest.

- A game of exploration and challenging adventure.
- Beautifully detailed animated graphics fire the imagination.
- Sound effects and MIDI compatible music add realism and dimension to game play.
- Three levels of difficulty combined with over 300 different full color screens.
- Thousands of programmed game variations keep Gold of the Realm always new and exciting.

TOTAL CONTROL SYSTEMS

GOE™

GRAPHIC OPERATING ENVIRONMENT

TOTAL CONTROL SYSTEMS is proud to announce the arrival of the very latest in 8 bit software, a true GRAPHIC OPERATING ENVIRONMENT.

Don't be fooled by cheap imitations! Don't be misled by advertised promises! It's time for your 8 bit to get up and GOE!

GOE is a complete desktop interface for the Atari 8 bit which ties up only 8k of memory for a 64k program - using the GOE cartridge! GOE supports icons, drop down/pop up menus, resizable/slidable/movable windows, control panel/calculator/notepad desk accessories, numerous mouse controllers, various font styles/sizes, and uses Atari help/console keys.......all this and externally programmable, too!

GOE doesn't stop there! GOE supports redefinable disk/file icons, comment storage for each disk/each file, time/date stamping, directory sorting, and........all popular DOS's including SpartaDOS II/X, Atari DOS II, and the new Atari DOS XE.

GOE includes complete programming information and a disk with Atari BASIC, Action! and Mac65 examples.

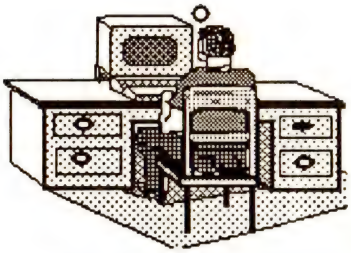
Atari Interface Magazine is a monthly magazine that also serves as the official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. A subscription to AIM is included in membership in any participating club or may be purchased directly from Unicorn Publications. For advertising or user group discount subscription rates, please call (313) 973-8825.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIMand the author (and club if applicable). Opinions expressed within articles in AIM are solely the views and responsibility of the authors and do not necessarily represent the opinions of AIM or of any participating group. Atari, the Fuji symbol and names of various Atari computer products are trademarks of Atari Corp.



Editorial Ramblings

COMDEX has come and gone, as has the Anaheim World of Atari show. Atari Corp. attended both events and there was lots to see for all.

The Michigan Atari Computer Expo will be over just about the time you read this, and contrary to any misinformation spread by a certain online "publication," Atari has stated they will have representatives at the Expo. At least one Atari U.S. executive has told us he will be at the show, and there will even be some Atari Canada execs at the Expo. Looking at that online publication's track record, the Atari community should be used to the factual inaccuracies they present. Perhaps that's why some online users have nicknamed them Z*Rag and ST Z*Rag?

Look for an in-depth feature on the Expo in the next issue of Atari Interface Magazine.

The second in the promised series of World of Atari shows nationwide will be taking place in Dearborn, Michigan on June 24 and 25. Atari will be attending this show as well, giving Michigan area Atarians a double dose of exposure. Atari Interface will give you complete coverage of this show as well.

See you next month.

Bill & Pattie Rayl

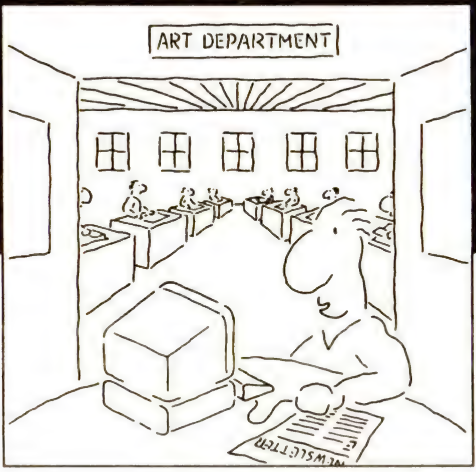
Open your own art department.



If you're a desktop publisher with big ideas and a small crew, let Migraph staff the desktop art department of your dreams.

Picture this: Professionally drawn images and illustrations at your fingertips. Powerful drawing tools, extensive editing tools, and a complete paint program at your command.

Plus high-quality printouts. Every time.

All that and compatibility, too. Migraph files load easily into your favorite Atari ST* publishing programs.

Powerful. Versatile. And easy to use. Migraph's the ideal candidate for every job in your graphics department.

Touch-Up™ The complete design tool for high-resolution monochrome images.

Easy-Draw® The professional object-oriented drawing program.

Supercharged Easy-Draw® Easy-Draw plus basic publishing features.

Easy-Tools™ A 5-tool GEM desk accessory to enhance Easy-Draw.

DrawArt Professional™ A library of over 150 professional line art drawings.

Scan Art™ A library of over 100 high-resolution, bit-mapped images.

Border Pack A library of over 40 attention-getting border designs.

OSpooler A configurable background file spooler and print buffer.

Whatever desktop graphics project you have in mind – be it big or small, simple or ornate, traditional or avant-garde – Migraph's got you covered.

See your Atari ST* dealer today for more details.

Atari News and Comment

by Bill and Pattie Rayl

Atari Corp. News

Sig Hartmann was recently promoted to replace Vincent Giametteo as the Executive Vice President of Atari Corp. and the President of OEM Sales. Giametteo was only recently promoted to the position Hartmann now holds, and it seems the Atari revolving door is still active.

Antonio Salerno, recently employed at Borland, is now in charge of Developer and Technical Support and Equipment Sales for Atari, duties recently performed by Cindy Claveran. His official title is Vice President of U.S. Software.

Other changes at Atari include the much-talked-about closing of the Federated chain of electronic stores. It seems the chain was quietly closed after the initial closing of 15 stores in the Western U.S. and the layoff of over 400 employees. Atari announced it was treating Federated as a discontinued company in the fiscal report from December, 1988 where Federated showed a loss of more than $100 million in the last quarter of '88.

Atari had a strong showing at the Spring COMDEX show in Chicago recently. The new Atari Portfolio created quite a stir with coverage by USA Today, NBC and PBS's Computer Chronicles. The Portfolio is a small, hand-held, MS-DOS compatible computer with 128K and a 40x8 column screen. The Portfolio can be expanded to 640K and has ports for parallel and serial connections. The Portfolio comes with a word processor, spreadsheet (which creates files compatible with Lotus 1-2-3), database software and appointment book built-in. The Portfolio retails for $399 and uses Ram cards as disk drives.

The STacey, Atari's Laptop computer, was also on display to COMDEX goers. The STacey's base price will be $1499, with option configurations for adding a 20Meg hard drive for a total of $1999. The STacey is ST compatible, and has all the standard ports of an ST. Instead of a mouse, a small trackball is built-in to control the "mouse" cursor. There have been conflicting reports on whether Atari will change the name of the laptop from STacey to the Atari "Transportable."

Michigan Atarians may have the opportunity to view the STacey and Portfolio for themselves at the upcoming World of Atari Show in Dearborn, MI on June 24 and 25. This is the second in a series of shows planned by ST World Magazine, the first of which was the Anaheim World of Atari show. The Spectre GCR Macintosh emulator and the PC Ditto II were both displayed at the Anaheim show. No more information on the Anaheim show was available at this printing.

New Products

A new Macintosh emulator for the ST will soon be released from San Francisco-based CEKA. The emulator plugs into the Mega expansion bus and doesn't use Mac ROMS! For 1040ST owners interested in the emulator, CEKA has developed a board that can be placed inside the ST with only five solder points. The emulator will retail for around $350. For more information, call CEKA at (415) 474-2641.

A new hardware product is being developed for the 8bit Atari. This product, currently under the name "The Black Box," is a parallel interface for the XL and XE computers. Bob Puff, creator of such 8bit utilities as DiskComm and SuperArc, put his skills to developing a hard drive interface with built-in RS-232 port and parallel printer port. The interface will be retailing for $159, and you may add 64K extra RAM for a printer buffer for an additional $40. An extra board can be installed allowing disk drives to be connected to the "Black Box." No price is yet available on this board. Bob Puff claimed users will be able to connect ST drives to the interface (perhaps in the XF551 case?). Using special software, users will be able to read ST-formatted disks on their 8bits, allowing information to be easily transferred between the two systems.

Online News

GEnie recently raised its hourly rates for the nighttime hours and lowered its rates for daytime use. GEnie is now $18 per hour during the day at any baud rate. After 6 p.m., the rates are $5/hr at 300, $6/hr at 1200 and $12/hr at 2400 bauds.

The Byte Information Exchange (BIX) is offering two FREE online accounts to each User Group in exchange for including a BIX brochure in a club mailing and a small announcement in each newsletter and on any club BBS. In addition, each member of the User Group will receive a substantial discount on the BIX charges. Recently, BIX has changed from an hourly rate to a flat quarterly rate of $39 for an annual subscription. Users calling through Tymenet may opt for a $15 per month flat-rate fee for unlimited usage. For more information, please contact BIX at (800) 924-9281.

Some Spellers are Better than Others.

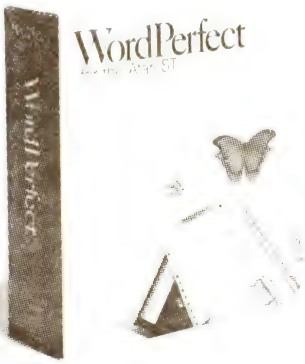
Before she won her regional spelling bee, Margaret Hollingsworth pored over seven different dictionaries for more than three hundred hours.

And while we'd all like to be champion spellers, most of us just don't have that kind of time.

So may we suggest putting the WordPerfect® Speller in your corner.

Not only will the Speller check your document (or any section of it) for errors and double words, it will instantly count the words in a document, page, or block of text.

You can look a word up phonetically to find the correct spelling, and the Speller will give you a list of replacement words with similar sound patterns. Or if you're looking for just the right word, and you know it begins with "s" and ends in "-ology," use a wild-card character to replace the unspecified letters. The Speller will show you a comprehensive list of your options.



With the WordPerfect Speller (included in your WordPerfect software for the Atari), more than 115,000 words are at your fingertips. No other speller can match that kind of power.

Not even Margaret.

I Love a Mystery...

Except When the Stakes are So High!

by Gordon Totty (MACE)

This is an authentic "whodunit," a real mystery with lots of puzzles to solve, suspense, scary stuff, a good guy, a bad guy, and lots of lessons learned the hard way, which is the best way. This is a tale told by an idiot, me, and I hope that it signifies something useful to you.

It stars me as the defective detective, and as the bad guy. Late in the show, it stars Mike Olin as a guy in a white hat who comes to my rescue.

Stories today need sex in them to grab attention, so let's get right to that first. It is good to be back, and feel your hot eyes poring over my turgid prose. As your moist, plump thumbs smear my ink, everything I say seems fuzzy and out of focus.... There, that should hold your attention for a while. Now, let's get sensible and act my age, although acting your age might be more fun for me.

It was a dark and stormy night in early February, 1989. I was alone in my study, unaware of the events that were about to befall me and plunge me into the depths of despair for the next several weeks. The love of my life, the Atari 1040ST, was in my arms and, in spite of the cold, I was sweating from exertion. I had rolled the little beauty up in the air and ripped out her mouse, with no small effort. I struggled to insert the plug from a MicroFlyte joystick into her mouse port. At last I succeeded and put the computer back down.

If you have never tried this, you might think I am exaggerating the effort it took. I am not. It is a tough job, especially if you have the older mouse plug without the metal band around it. That plug is tough to pull out. Inserting it, or a MicroFlyte plug in its place, is harder still. The port is hard to reach, and you have to approach it at a near-perfect angle, which the designer decided should be almost impossible to do with the clearances he allowed. Picture me with low light under the computer, my neck straining because of the bifocal burden, only one hand free for the job because the other hand is holding the computer up, and you might begin to understand that I was sweating in February.

You see, in addition to the physical strain, I was worried. Five cables come out of the back of the computer, and I didn't want to stress (or strain) them too much. I have had experience with a cable failure at work, and do not want to repeat the experience at home. Also, dangling out of the cartridge slot on the left, I have a cartridge accessory. It was swinging around in space as I wrestled with the plugs.

After succeeding, I booted Flight Simulator II to try out the new stick. I didn't like it. It seemed to operate in a very sporadic manner, but I didn't think anything of it at first because the instructions said that I might have to set or calibrate it.

The next day, the MicroFlyte stick would not operate at all. I tried everything I could think of, and concluded that it was broken. I packed it in its box, and sent it back to the folks who asked me to try it out. I asked them to let me know if it was broken, because I had begun to notice that strange things were happening. Ho, ho. Hee, hee. (Where are you, Red Buttons?)

At first, the reinstalled mouse would not operate. The cursor could not be moved with the arrow keys. The MicroFlyte has its own built in computer chip. Could a bad chip have "attacked" my good mouse port chip, or circuit, or memory? A Trojan horse joystick? A virus? Holey moley, Batman! Leaping lizards, Annie! My love was running a fever, and the new stick was the only thing it had been exposed to, right?

(If you have solved the mystery at this point, with only one clue given, you are an EXPERT! I am not. I was completely in the dark at this point, and beginning to entertain dreadful fears. The 1040 is the monkey on my back, and thinking of a trip to the shop was already making me act like Frank Sinatra in "Man With A Golden Arm," or Don Murray in "A Hatful of Rain.")

Things got better; then they got worse. The next morning, I booted up before going to work, as if to check whether the events of the previous night were just a nightmare out of Edgar Allan Poe. Everything was working. I rubbed my eyes, and looked again. Everything was working! I soared off to work. Life was good again. Birds chirped in February. But not for long.

Other problems began to occur, with a frequency of once or twice per week. I should point out that I turn the computer on about five out of every seven days. My wife would tell you, "Seven out of seven is more like it!" but she exaggerates a lot.

One day, I booted up and tried to use my word processor. Things worked, but in slow motion. Commands took five to ten seconds to be implemented. I rebooted, and everything was fine. I wondered if perhaps I had not followed the instruction for starting the hard drive (turn it on and wait about 15 seconds before turning on the computer). What gives here? This was the strangest problem I had ever seen.

Another day, using 1st Word with the hard drive off, I was typing an article for a magazine. I was thinking, between typing bursts, and just leaning back looking at the screen. I was not touching anything. All of a sudden, the cursor-arrow turned into a "busy bee" and then the infamous row of bombs appeared. The machine locked up. I lost my file! (Honest, folks, it was the best stuff I have ever written in my life, but no one will see it now. It is gone into some electronic limbo. It now has as much meaning as that tree that fell in the forest that noone heard.)

The next day, a helpful expert at the office told me his theory that the program tried to do an automatic backup to the hard drive, which was turned off. When it failed, it crashed. I thought there might be something to this theory. I had booted with my normal boot disk, which includes the hard drive booting software and Universal Item Selector II. I could hardly wait to get home from work to check the 1st Word documentation. I don't use that program much, and wasn't familiar enough with it to know, while at the office, that there is no automatic backup feature. Well, it was a good theory for a while. It made me feel good all afternoon that day.

February was a cold, dry month. The furnace ran quite a bit. Our furnace was not equipped with an automatic humidifier. There was a deep, dry, chill in my bones.

(How are you hackers doing? Anyone got the answer? If I wasn't so cheap, I'd make this a contest and award prizes for the earliest correct answer ... assuming I know what it is!)

Another day, I was typing a letter to dear old Mom using my word processor and the hard disk. Out of the blue, I was treated to the sight of six or seven bombs! I didn't do anything wrong; this was unfair. Total lockup; another lost file. Sorry, Ma. Maybe I'll call.

I have used Atari computers, a 400, 800, XL, XE, and ST, for over five years. Since drop kicking the 410 recorder out the door, I have never lost anything. I have laughed at the advice about backing things up. I have ignored all the safety rules. I have enjoyed very reliable computers, disks, and disk drives. What I was enduring now was alien to me. Perplexing. Frightening. Frustrating. I resorted to strange practices. I implemented the automatic backup feature of WordPerfect, and set it for timed backup at every ten minutes. Extreme conditions call for extreme measures! I was in a foxhole; I was beginning to get "religion."

One other evening, I was entering records in my data base. I had about 50 records posted, when I turned away from the machine to get some more data. When I looked back, I was astounded to see the desktop. No bombs. No lockup. But, no saved file, either!

I shut off the hard drive, and rebooted from drive A. While inputting data, I saved to drive B after every ten or fifteen records. I entered 120 records with no problem. I am now a frequent saver, even when I do not have an automatic backup program to think for me.

Later that evening, the system crashed while switching disks in drive A.

More help from the experts at work! It was suggested to me that static electricity could be the culprit. Even though I wondered how I might have caused a crash and lock up while not touching anything, I immediately put a large evaporation pan in the room with the computer. Also, I resolved to install the furnace humidifier that had been sitting in the basement, brand new in its carton, for over a year. It was installed in a day or two. After all, I do have my priorities to think about.

By this point in time, late February, I had developed a list of suspects. Like good detectives, let us consider them one by one. They are waiting for us in the parlor.

The Hard Disk. Not a leading candidate. Two problems occurred when it was off, and I had no trouble at all during the first five weeks of its use. Of course, just because it was running right for a while doesn't mean it will be right forever. After all, a bank robber is not a criminal, until he pulls his first heist.

DeskCart! and/or its associated boot software, including the Universal Item Selector. I booted with this every time that I had a problem, except for the first instance with Flight Simulator II. However, this combination worked flawlessly for about a year preceding February. Besides, for the software, I would expect a problem on booting, but not later in the middle of an application program. What do you think?

Static electricity. For a while I was sure that this was the problem, except that I continued to have difficulty after raising the humidity. Do you think I need more humidity? An anti-static mat? I have a friend who sent two PC keyboards to the shop with jolts that leaped from his fingers.

Mouse, or the mouse port or pins. The mouse was not directly active during most, if not all, problem incidents, so this was not a strong suspect. Nevertheless, it is a rodent; like a rat it is not to be trusted!

Computer. The trusty, reliable, Atari 1040ST might be starting to fail. Since the problems usually occurred after some period of use, I suspected a heat related failure.

MicroFlyte's joystick. Could it have caused damage to the computer's circuits? After all, I had no difficulty prior to attempting to use this product, and all kinds of difficulty afterwards. (Anyone know what post hoc ergo propter hoc means? It refers to a fallacy in logic based on few or single instances of an occurence. The fallacy is to conclude, "after this therefore because of this", or something like that. Well, can the Latin crap, this hoc was my main suspect for a long time!)

Well, all you "Murder, She Wrote" fans, whodunit? All of the suspects that I gathered above are innocent except one. That one was guilty, but not in the way I then considered to be likely.

Let's get back to the tale of tears. There were more shed before the truth leapt up and punched me in the kisser. Hey, I wasn't crying, for crying out loud. I'm a private eye guy on a case, and tougher than a two dollar steak!

Late one night, when I didn't expect it, my word processor displayed three bombs and the computer locked up. Another lost file.

On shutting down one other night, with the hard drive off and the desktop showing, I bombed while taking a disk out of drive A. This was getting to be a habit, a bad habit.

With a different database program, and 40 records waiting to be saved (what happened to saving every ten or fifteen? .... how quickly I forgot), I looked up and saw ten bombs on the screen! I rebooted and in five minutes got three bombs. In both cases, I was not touching anything when it happened. Also, there was no disk activity. Earlier that evening, the kids had used a game for 45 minutes with no problem.

Throughout this period, no game ever bombed or locked up. (Could this be why the Atari is a good game machine?) Trouble always happened with productivity software in use, or during shutdown from productivity applications. This is one reason I suspected the boot disk. It is not usually used with games.

I tried to provoke a lock up or bomb out by wiggling all the connecting cords and cables. Nothing produced bombs except wiggling the DeskCart!, an unnatural act. I decided the problem lay elsewhere.

The grief continued. I was far closer to solving this than I realized at that time. Have you got any ideas? Who or what do you want to put the pinch on?

Four days later, while using my word processor, two bombs appeared and I was kicked back to the desktop. The computer did not lock up; I was just kicked out of the application program without an opportunity to save the file. The file was largely recoverable because I was using an automatic backup option. I decided to reset the backup option to do a save every five minutes.

That same day, I finished typing a letter, saved it, and tried to print it. The computer immediately locked up, with four bombs displayed on the word processing screen. The busy bee icon was frozen on the screen. The busy bee was a dead bee. Nothing worked. I rebooted, and recalled the file, which I had saved, and printed it with no problem.

For many days, I had been considering what I would do while the ST was in the shop for repairs, which is where I was sure it was heading.

Fellow detectives, I have read that the number of bombs displayed is valuable information pertaining to what went wrong. I was recording the number for possible use by a service technician. So far, I had noted two, three, five, six, (maybe seven, once),eight, nine, and ten bombs, sometimes with total lockup and sometimes without. Sometimes I was just returned to the desktop. I love a mystery, don't you? My hair was falling out over this one!

I do not like contemplating a potentially expensive repair. My flesh crawls at the thought of the ST being gone from my home for one, two, or more weeks. I had visions of being told, "Sorry, we had to send your unit to Taiwan. The airfare was high, so we sent it by ship — out of New York." And then, in my nightmare vision, I would read that the Panama Canal was closed for repairs. The worst nightmares are those that only go away when you are asleep, if you can get to sleep. My brain was constantly considering possibilities, probabilities, suspects and clues. This case must be solved!!

I could have bought an ST520 during the recent MACE swap night for $200. Why, oh why, didn't I do it. It would serve me well, while the 1040 is in the shop. Thinking like this made me realize the degree to which I have abandoned the XL, which sits right next to my ST. When this dawned on my consciousness, I began to focus on the fun that I might have renewing acquaintances with the XL, my old girl friend, and I found some small comfort in that thought.

The next day, I began to unravel the mystery. The case was cracking like an Easter egg in the hands of a hungry five-year-old. From here on, it would be like taking candy from that baby.

I was again putting records into a database. As is my custom, the material I was reading from was on my left, to leave the mouse clear for use on my right. I put some material away, and put a disk case in its place. The disk case touched the DeskCart! cartridge. Wham!!! Nine bombs — locked up — 27 records lost, but I sat there smiling, with a cigarette hanging out of my mouth and my beat-up hat perched on my head at a cock-eyed angle. Eureka! (Oops! Forget that Greek stuff.)

"Gotcha, you varmint!" I drawled. (Oops. Forget that Western stuff.)

The truth slammed into my guts like a hot slug from a cold 45. At least, that's what I thought. How many of you are prepared to blame the cartridge? Read on, maybe more of you will join me in blaming the cartridge. Let's slam it in a chair, under a hot light.

I decided to run some tests:

1.) From the desktop, I wiggled the cartridge slightly. The computer rebooted. I did this twice, just to make sure it was no fluke. Bingo, and bingo again.

2.) I loaded my word processor and touched the cartridge. This time I got three bombs on the screen and a locked up computer. This is getting interesting.

3.) I loaded my database and slightly lifted the cartridge. Again, I got three bombs, but this time the computer did not lock up. Instead, I was kicked back to the desktop. On continuing to use the computer I noted weird effects. Mouse operation was erratic, with very slow reaction from the computer to commands input by the mouse. I hit the reset button to start over, and was again surprised. The computer locked up during rebooting.

At this point, I believed that I had rather successfully duplicated all of my problems, merely by disturbing the cartridge. Could the cartridge be failing? Is this what happens when the battery in DeskCart! is failing?

I slid into my old trench coat, shoved the suspect cartridge into my pocket, and drove my beat-up Mustang to United Computer, where I bought DeskCart! over a year ago (warranty expired, naturally). Mike Olin (cheer) tried it out on a machine in the store. It slid into the port very snugly; it is loose in my machine. Tapping, banging, and wiggling it did not produce any problems. Good grief, now what?

Mike suggested that the problem likely was in the slot itself, and that maybe the contacts were too loose. He told me how to try to fix this myself, without opening the computer. He cautioned me that everything should be turned off before I touched anything. He reassured me, that this type of repair, even in the shop, would be quick and easy. I went home and tried his advice. It worked.

Total cost of repair: $0. Time to perform repair: 5 minutes (10 if we count how long it took me to find my jeweler's screw drivers).

Mike Olin is a "brother" from MACE. He knows more about computers than I do. This is why I belong to MACE, for support. Mike also works at United Computer. This is why I do a lot of my shopping locally, for customer support. In fact, I was so grateful for the free advice that I went out of my way to make a purchase while I was still in the store. I now own Atari Planetarium for the ST. Some of you will remember the impressive demonstration of the 8bit version of this program at a MACE meeting a while ago. What goes around comes around ... and sometimes it is something good.

Now, for the big wrap up, the final reel in this thriller. The lessons I learned, or re-learned, are:

- Always back up your files frequently. Even computers that have operated flawlessly for years can get into unforseeable difficulty some day. Be prepared; be protected.
- Use all of the protection features that may be available to you. If your word processor has automatic back up, activate it.
- Be careful about moving your computer. Installing the MicroFlyte joystick was harmful to the cartridge port. I should have removed the cartridge first, instead of letting it dangle in space and possibly further deteriorate its loose connection to the computer.
- Beware of hasty conclusions. At various points, I was sure the problem was coming from my innocent hard disk, certain software, the DeskCart! cartridge itself, or had been caused by the MicroFlyte joystick. All such conclusions were false. Sorry, DeskCart! Sorry, MicroFlyte.
- Support your user group and your local merchant. They can support you. Thanks, Mike. You ended my six week nightmare.

Now, the big sleep comes easy again.

New Improved Version

TURBO ST

By

SOFTREK

P.O. Box 5257
Winter Park, Florida 32793
(407) 657-4611

— FASTER THAN A SPEEDING BLITTER !!

- Makes your 520 / 1040 ST™ outrun a Mega ST™.
- New version supports HiRes 40 and 50 line modes.
- Makes ALL versions of TOS run faster.
- Only $49.95 — Less than half the cost of a hardware blitter.
- Installs automatically — just load it and forget it.
- No soldering, no copy protection, no setup — Just speed.

Turbo ST vs The Blitter (% speed increase)

	Monochrome		Color	
	Blitter	Turbo ST	Blitter	Turbo ST
dBMan 5.0	10%	59%	8%	60%
Data Manager 1.1	83	94	85	88
1ST Word 1.0	37	35	34	41
GFA BASIC 2.0	22	69	13	65
Interlink 1.8	53	63	46	71
ST BASIC 1.0	221	517	219	567
ST Writer 3.0	18	116	17	127
Word Writer 2.0	34	31	35	37

Results obtained while paging through an appropriate data file.

Ask for Turbo ST at your local dealer or send $49.95 plus $2.00 shipping and handling to SofTrek, P.O. Box 5257, Winter Park, FL 32793. Florida residents add 6% sales tax. Visa and MasterCard phone orders accepted. Call (407) 657-4611. Upgrades to version 1.4 are available for $5.00 U.S. plus your original disk. Offer expires 60 days from the date of this publication.

Turbo ST does not speed up programs that use GDOS fonts or that bypass the GEM operating system, such as PC Ditto, but is compatible with them. TOS, ST BASIC, ST Writer, 520 ST, 1040 ST, and Mega ST are trademarks or registered trademarks of Atari Corp.

Computers and Education

by G.L. Ray (TACE)

I don't get on a soapbox very often. But I encountered something this past week that moved me to write this piece. The subject I want to explore is the connection between computers and the classroom; how many computers are needed and how they should be utilized.

Let me explain how I use computers in my classroom. I have two 130XE systems of my own which I take to school to use in my classroom. I also have two Panasonic 1091i II printers connected to MPP 1150 interfaces. I teach 7th- and 8th-grade art in a medium-sized junior high school. We utilize the computers in several ways.

First of all, as a teacher, I use the computer to record and average grades. Another way I utilize a computer is to maintain a student database. Such information as student phone numbers, addresses, and parents names can come in very handy. I also use my word processor continuously to produce handouts, quizes, and assignments. I can keep lots of assignments and handouts on one easily found disk. (My file cabinets are not known to be very tidy. On the other hand, my disk library is a model of efficiency.)

If the above were the only reasons for a computer in the classroom, for me it would be enough, but the students utilize the computer also. First of all, students use the computer as a means of creating art. I use Rambrandt, the design studio software from Antic Magazine, as a tool for creating artwork on the computer screen. As an assignment, each student is to create a drawing on the computer, print it out, and mat it for display. A second assignment is to create a graphic printout with various application programs, such as Printshop, PrintPower, and Awardware.

The most ambitious project for my students has been producing a school newspaper. Students utilized the word processor, Printshop, Crossword Magic, and a WordFind program from Antic magazine in creating their first newspaper.

Now, what value do the students receive from using a computer? Don't real artists paint with brushes not joystcks? Is a computer really necessary to teach art?

Well, yes and no. I could teach art with nothing but a pencil and a sheet of paper. But I choose to also include brushes and paints, pen and ink, screen printing and numerous other materials and tools. The computer is just another tool I utilize in teaching design, creativity, and all of the other aspects invovled in an artwork.

My view on the use of the computer in the classroom differs with the traditional viewpoint. The traditional view puts the computer in a computer lab where students learn to program in BASIC, utilize a word processor, and maybe some drill practice on math or history facts. Computers are used to learn about computers or to take the place of flashcards.

I have two strong arguments against this format. First of all, who gets access to these computer labs? Usually, only the top students. The majority are left out in the cold. Second, how can computers in a lab setting prepare students for real world applications? Computer labs dwell on computer programming/operation and drill practice, not on problem solving and creativity.

I believe that the computer can be utilized in every subject taught. An English teacher can let students type their own poems and short stories. An Economics teacher can assign students to key in the latest figures into a stock market simulation. Science fair projects can be accentuated with graphics, signs, and banners using Printshop. I could go on and on, but you get the picture.

In the real world people don't use computers to learn how to program in BASIC. They use computers for spreadsheets and word processing and desktop publishing and telecommunications. Computers are used as a tool to solve problems. And that is exactly how computers should be used in the classroom. Computers should not be removed from the rest of the curriculum, but integrated within it. Teach students how to utilize the computer to get things done...on the job training, so to speak.

How many computers will this take? Several computers will be needed in each classroom, obviously more than most schools wish to spend. But yet, maybe not. Not all teachers are ready, or willing to take this approach. Some teachers that I work with are terrified with the computer. Let's just start with those adventurous souls ready to expand the education process, and put a few in each classroom, always expanding each year as there is need.

And whoever said that computers have to be IBM or Apple? I could install three to four Atari systems for each IBM or Apple and accomplish every bit as much. You see, it's not the computer system used that is important, it's how the computers are put to use. The principles are the same.

Our school has received a $50,000 computer grant for our library. But we can only buy certain EDUCATIONAL software to run on IBM or APPLE computers. And we can't have more than a certain number of computers unless we put them in a computer lab format. And what does all of this accomplish? It gives teachers something to let students do when they get finished with their regular assignments...they can go to the library and PLAY on the computer.

I am sure that other views on computers and education have their good points, but to me, we are missing the boat. Let's integrate computers into all aspects of the curriculum, allowing all students to learn how computers can enrich their lives. Let each classroom have computers as part of their equipment. Teachers can then use the computer in any number of creative ways right there in the classroom. They can even let the kids PLAY on the computers when they get their regular assignments done, and run some of that EDUCATIONAL software. But, just think of the many other things that could be done....

ST/MEGA

Michtron Eprom Burner (up to 512K eproms) $199
Atari SH204 Host Adapter This is the cheapest Atari hard drive host adapter availlable. Can be used with standard hard drive controller cards like the Adaptec 4000A. Great for building low cost hard drive systems. $60
P.C. Ditto cable kit (3 ft cable with installed 14 connector one side and bare wires the other side and 34 edge connector + pin outs) $10 ea.
Because you asked for them we have brought in! 3 ft SC1224 and SM124 monitor extension cables! (M to F) For use with Goldstar and Samsung monitors with one sided short cables $25
13 pin Female cable connectors $4.75
14 Pin Female cable connectors $5.60
(Use these 14 pin Female connectors with a standard printer switch box and make a drive switch box for P.C. Ditto drives)
Mouse Feet (our feet have twice as much teflon material) $4 pk (4)
Mouse Eyes (Taiwan mouse only) 8pk (one mouse set) $5
Mouse Cleaning Kit by Tacklind $12.95
Mega Keyboard Covers $8.50 ea.

400/800/XL/XE

Digital Devices APE-LINK Kits (adds extra SIO Connectors to Your Atari Daisy Chain) Bare P.C. Board $10 Kit $21
1030 Modem Special ! 29.95
New 256K Atari Game Cartridges in stock. See our cataloge for listing!
Thomson Proburner Eprom Burner $149.00
XL Keyboard Mylars in stock now! $22 ea
In Stock 130XE Cartridge Connectors $6.30
Many people have asked which Mailing List program we use at Best Electronics, we currently use Super Mailer+ from Royal Software. Super Mailer program (D) $39.95
XL to XE Software Compatiablty Mod by Tom Lawless. This two chip/switch mod is for enhanced 800XL computers (256K-512K). $8
Hardware upgrade kits and P.C. boards that require the 41256K ram chips have been put on hold because of the high price of ram chips. We hope to ship again once ram chip prices start to drop down!

Atari/Imagen UltraScript Postscript Emulator

by Richard L. Brice

Copyright 1989, Dayton, Ohio. Reprinted with permission of CompuServe and the author.

The Ultrascript Postscript Emulator for the Atari SLM-804 Laser Printer is probably one of the most exciting products to surface for the ST series of computers. When it was first introduced, the SLM-804 was extremely limited in it's capability. The Diablo 630 emulation was flaky at best. The GDOS output routines were much improved from previous releases but user hostility toward GDOS curbed interest in the printer. It was cheap, but other low cost lasers offered Epson emulation and HP Laser Jet (an industry standard) emulation as basic capability. It simply wasn't a good business decision to buy the 804. The advent of Ultrascript changes all of that. Postscript emulation for the "dumb" 804 makes it a real value. Should the emulation be developed for other printers using the Mega ST the serial or parallel interface is still slower than the DMA interface of the Mega/804. Crude benchmarks show that Ultrascript will deliver a printed page approximately 10 times faster than the Apple Laserwriter Plus running with a Mac SE. What we have here is real value.

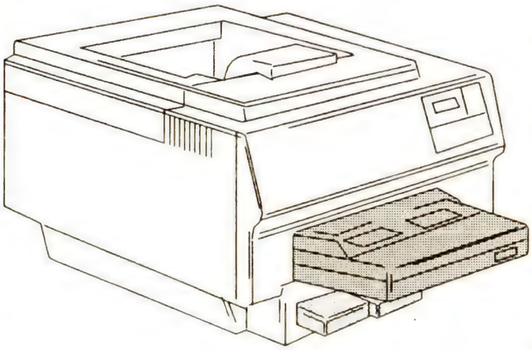
Ultrascript currently requires that your application be able to print a Postscript file to disk which may then be processed by the emulator later. This does not, in my opinion, present a problem. Do your work, exit to the printer, setup, print, and go have a beer. The print function ties up the computer anyhow so I would just as soon batch print everything at once. Either native "Quickdraw" or GDOS routines may be used for draft print-out as you go along.

Now, how do we use the system? What programs are available for use with Ultrascript? Surprisingly enough, several first rate programs are in place. By accident or design, Pagestream from Soft Logik is optimized for Postscript. That program is possibly one of the most powerful page layout programs available for any computer regardless of price. Fleet Street Publisher from Michtron is another Postscript compatible for the ST. Fleet Street has its charm in the ability to have GEM screen fonts while accessing Postscript fonts for output. With a little work and a good GEM font editor (Fontz! from Neocept is recommended) you can achieve a true WYSIWYG screen display with Fleet Street. The Timeworks Desktop Publisher can also write a Postscript file to disk. Unfortunately, the interface is, in my opinion, a kludge. A file called "PUBLISH.PS" is written to disk each time you invoke the print command. This file is constantly overwritten. It is also impossible to change the screen fonts or to add additional Postscript fonts to the font list. It is unfortunate that Atari chose the Timeworks program to bundle with the SLM-804 Postscript package. It is an excellent program, but just not suitable to the vast capabilities of Postscript. Thanks to Gadgets by Small, we aren't necessarily limited to Atari programs. The Spectre 128 opens up the world of MacIntosh programs. Of all the page layout programs for the Mac, Pagemaker seems to offer the best interface with Ultrascript. It seems than any Postscript file saved from Mac applications contains a prologue written by the Apple Laser Prep program. This prologue is totally incompatible with Ultrascript. But, take heart, Pagemaker uses Aldus Prep which is completely compatible with Ultrascript. Further, both Illustrator and Freehand run well on Spectre allowing for high quality Postscript illustrations which may be placed and printed through Pagemaker. While total Mac interoperability can not be achieved due to the eccentricities of Apple Laser Prep, you can get Postscript output through Pagemaker which should satisfy any requirements you might have. Although I have not made any investigation of the PC world, I would assume Pagemaker provides the same bridge capabilities from the IBM.

Before I digress into a discussion of how to make Ultrascript work with specific programs, let me spend a little time on how the program itself works. You may install it on your hard disk. The test article was evaluated using a Mega 4, with 30mb hard disk, and the SLM-804. The "4" provides sufficient memory for the complete Laserwriter Plus fontset plus the entire Lucida font set with no problems. I cannot say what the font limit is as yet but we are working on that. The program, when run, is simplicity itself. You are presented with a screen that looks very similar to the Outprint screen from Migraph's Easy Draw. The program works almost identically to Easy Draw Outprint. There are 35 "slots" for filenames. You add names to the list and invoke the "Print" command and Ultrascript does it's thing. Simple enough. You have options for multiple copies as well as an option to enter the Ultrascript Executive. In a month of heavy use, I have never had the program "lock up" or "bomb". If it encounters a problem it advises that it has encountered an "offending command" and is "flushing to end of job" and then stands by for the next print command. This is, by far, one of the most solid ST programs I have ever encountered.

As to how you get it to work with the various programs available, let me review each in turn:

PageStream. As I mentioned, the program is optimized for Postscript. You may use the PageStream fonts after you have converted them to PS output files as per the instructions that are included with their font converter. Unfortunately, their fonts are not that good and in that their Postscript output routine defines each font, it writes some incredibily long files. To make PageStream recognize the Ultrascript (resident?) fonts you must do several things, again using the Font Converter. The UMETRICS file provided with Ultrascript contains AFM files for each font. These AFM files may be loaded into the converter, and the program automatically writes a corresponding .FM and PSF file. A screen font may then be generated by importing the Pub Partner font and generating a .12H screen font. You must assure that the ID numbers agree with those recommended by Soft-Logik (see their doc file on the converter). Unfortunately, PageStream screen font representation is wretched because they use the one 12 point font and scale up or down from that. The good news is that the alignment is ok. You merely have to endure a not so WYSIWYG screen presentation. I don't consider that to be a show stopper, considering the other capabilities of PageStream. I am working with Soft-Logik to solve the screen font problem.



Timeworks Desktop Publisher. The program works. A PS driver is now available that outputs to disk, subject to the restrictions mentioned above. Here's how you interface the program with Ultrascript:

1. Rename the PS driver to PRINTER.SYS and copy it to your GEMSYS folder.

2. Run FONTWID.APP and say yes to the query on Postscript printers and select Laserwriter Plus.

3. Run PUBLISH.APP. You will see that Laserwriter fonts are available for selection at any point size. The problem is that only eight are available. Helvetica Narrow and Dingbats are not accessible. Further, the screen representation uses only Swiss (for all sans serif fonts) and Dutch (for serif). This includes Chancery. A very un-WYSIWYG presentation which is marginally acceptable. If Timeworks DTP is all you have then it will work but don't expect to tap the full capabilities of Postscript with it.

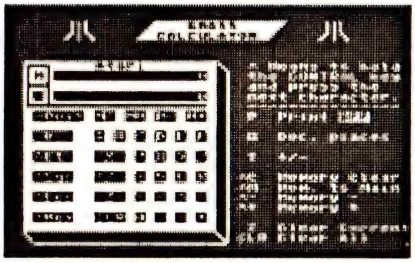
Fleet Street Publisher. FSP allows you to include new Postscript fonts and to assign GEM screen fonts to the Postscript fonts. GEM screen fonts are easily generated by Fontz using the public domain screen fonts for the MacIntosh. To explain how the fonts are harmonized in the program would take pages, but you do it with the Set Defaults option. My only suggestion is to read the section in FSP documentation on Inside Fleet Street Publisher and Set Defaults...several times. The good news is that you have, with FSP, a true WYSIWYG presentation. The program has a lot of flexibility in working with type but is somewhat limited in graphics (pretty much limited to bitmap stuff for now). All in all, however FSP may present the ideal low-end layout package for use with Ultrascript. The 2.0 version now sold by Michtron is much improved over the original.

Other GDOS Programs. In theory, all GDOS programs should work properly with the PS driver. Easy Draw functions fine. There is a problem getting Write and WordUp to recognize the fonts.

MacIntosh Programs. As I mentioned previously, most of those MacIntosh programs used by desktop publishers run with no problem on the Spectre 128. Aldus Pagemaker creates a Postscript file that is compatible with Ultrascript. Therefore, almost anything you can do on the Mac can be placed in Pagemaker and output as a Postscript file. The procedure for this is fairly simple. First, you have to have made a choice of some laser printer with the chooser. Having done that, select print from the file dialogue. Hold down the ALT key and click on the OK button. Wait for the Postscript options menu to show. De-select "download bitmapped fonts". Select "Write Postscript File to Disk" and choose either Normal or EPS. Remember to save the file on an MFS formatted floppy in order to transvert the file to the ST for Ultrascript printout. That's all there is to it.

I do believe that the advent of the Ultrascript emulator brings the ST out of the realm of a "Super Game Machine" and into the realm of a serious 16-bit business computer. It realizes the true potential of the SLM-804. You can now realize the dream of an inexpensive, high quality, and extremely fast personal laser printer. The speed is important. Although I have not run any controlled benchmark tests, preliminary experience shows that Ultrascript and the 804 turns out a Postscript page approximately 10 (yes I said 10) times faster than the Laserwriter Plus. Worst case, a Mega 4, Megafile 30, and an SLM-804 (with Ultrascript) gives you the same capability as a 4 meg MacIntosh Plus with hard drive and a Laserwriter Plus with 3.5 megs of RAM for under $5,000. I invite you to price out the Mac package.

Any dedicated Atari ST user needs to consider the implications of Ultrascript. With it, the Spectre 128, and the new PC Ditto II hardware IBM PC emulator for the ST you have a triple threat capability that is real.



The GRASS Calculator

by Gary Heitz (GRASS)

The GRASS Calculator was created as part of the Grand Rapids Atari System Supporters' BASIC programming class. We started by explaining cursor controls and simple PRINT and POSITION statements.

A simple calculator was used to demonstrate these commands and to explain the math operations. As time went by, the simple calculator became more involved and grew as new features were added.

One unusual feature that was included affected how the calculator's memory worked. On a normal calculator, you store something in memory but unless you have a pretty good memory yourself, you can easily forget what you stored there. The GRASS Calculator has two number displays. One is like that on any calculator — the main display. The second one always shows what has been stored in the memory.

The other features of the GRASS Calculator are:

- Print - will print to a printer just like a more expensive printing calculator will do.
- Change decimal places - will either display your number normally with no alterations to any decimal places, or it will round the number's decimal places to the nearest hundredths.
- Change signs - This feature is like the +/- key on most calculators. It will change the current number from positive to negative or vice versa.
- Four memory keys - Memory + (add to memory), Memory - (subtract from memory), Memory (display the contents of memory in the main display), and Memory Clear (clears the memory).
- Clear and All Clear - Clear erases the number you are currently entering (good for when your finger goes a little crazy on you and hits the wrong key). All Clear will clear everything in the main display. It does not clear the memory, though.
- Root and Square Root
- Decimal to Hexadecimal Conversions
- Hexadecimal to Decimal Conversions
- Percent - This will convert a number into its percent.
- Quit - I added this feature because it allows for a clean exit from the calculator without having to hit the RESET button.

Because the GRASS Calculator is not just for adults with perfect coordination, which does not include myself, I have added some "safety" features. The BREAK key will not work. The two other keys that will get you nowhere are the Atari, or inverse, key and the Caps key. If you hit one of these keys by accident, there is no need to worry; they will be ignored.

Here's an idea for any BASIC programmers out there or anyone interested. If you renumber this program to begin with a high line number, like 30000, you can do your programming and GOTO the first line of the calculator to use it and QUIT when you are done with your calculations. This way you don't have to keep loading and reloading the program you are working on.

One last thing to mention. The two inverse letters that precede each line in the type-in program are checksums. They work the same as any BASIC program that you find in Antic or ANALOG. You can use either of their type-in programs to type in the GRASS Calculator.

I hope you enjoy using it.

[*Editor's Note:* The type-in program for the GRASS Calculator begins on the following page. A copy of the program can also be downloaded from the AIM area on the Treasure CheST BBS, (313) 973-9137, 300/1200/2400 baud.]

NOTE: The following listing contains "shorthand" versions for many non-printable characters. Examples of some of the codes and their descriptions are:

[Inv] = Press the Inverse Key once
[Norm] = Press the Inverse Key again to toggle back to normal mode
[# Sp] = Type # number of spaces
[# X] = Type # number of character X (i.e., [3 *] means type 3 asterisks)
[^X] = Hold down Control while pressing the X key
Sft X] = Hold down Shift while pressing the X key

In all these cases, DO NOT type the brackets; the brackets serve only to delimit the "non-printable" characters.

Also, any time you see what appears to be control characters outside of brackets, such as ^C, these characters should be typed as the ^ (caret) followed by the character in the listing.

One or two spaces in the listing are displayed as spaces and should be typed as shown. Only when more than two spaces appear together are they represented in "shorthand."

DeskTop Publishing on a 130XE

by G. L. Ray (TACE)

The newest and biggest application for the personal computer has to be desktop publishing. But, as of yet, the 8bit Atari has no versitile, user-friendly package that will create the type of product I expect from a DTP program. Sure, there is Newsroom and News Station and Typesetter. I have all of these programs, but they either are very limited in features, user friendliness or in print quality. My solution, therefore, was to combine features of several programs to achieve the results I wanted.

I teach 7th- and 8th-grade art in a junior high school. I assigned my 8th graders to produce a school newspaper as one project. We utilized two 130XE systems with Panasonic 1091i II printers. We used the computers to print out masters of the newspaper pages and then ran the paper off on school copy machines. The results may not be of laser printer and professional print quality, but the output was suprisingly good.

The software packages I used were varied and included professional as well as Public Domain programs.

The most utilized program I used was a word processor. Any word processor will work, providing it has the these options:

- Formatting commands to change margins, page lengths, etc.
- The ability to print double columns.
- A print preview feature to view the printout before sending it to the printer (Saves lots of paper!).
- The ability to print to a disk.

The word processor I use is the First X-Lent Word Processor, which has all of the above features and many more. All of the students' articles and submissions were first typed by the kids and saved to disk. I then proofread and helped the students correct their work.

The next step was to print the copy to disk, creating ASCII files which can be used by the Daisy Dot II Print processor. Daisy Dot II, a Shareware program by Roy Goldman, takes the ASCII file just created and enables you to print out your document in a wide varity of NLQ fonts. I have over 90 different NLQ fonts in almost any style to fit any application. I won't go into all of the features of Daisy Dot II, except to say it is worth many times the $10 fee Mr. Goldman asks to register your copy.

Another program I used extensively is the Printshop from Broderbund. Printshop was used for illustrations and headlines. Some printouts were printed with Printshop directly to the final copy, while others were printed separately and pasted-up to the final copy with rubber cement.

We included crossword puzzles in our newspaper by utilizing Crossword Magic from Datasoft. First, I had the students make a wordlist and list of clues. Students then followed onscreen prompts to create and print their puzzles. I had the kids cut out and paste-up their puzzles and clues onto the final copy, created with the letterhead feature of Printshop. In this way, students could title and illustrate their puzzles with appropriate icons from various Printshop Library disks.

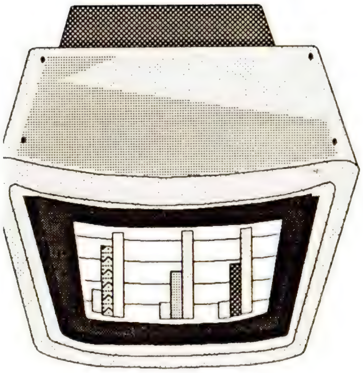
Another type of puzzle we used in the newspaper were WordFinds. We used a wordfind program written by Matthew Ratcliff, published in the January 1984 issue of Antic. This program allows you make a WordFind puzzle anywhere from 10 to 30 letters square. It will then send it to a printer and even print out a solution, which we printed in the back of the paper. We also utilized the Printshop letterhead feature to do graphics and headlines. One of the best wordfinds was one which included the first name of every student in the junior high. We had to make two puzzles, and then paste them up side-by-side to get all of the names into a puzzle, but the results were impressive.

All in all, I was very pleased with our production. The project combined computer skills (Word Processing, Printshop, etc.) with tradional commercial art skills (Paste-Up, Freehand Cartoons and Illustrations). It was a very good educational experience, with results that the students could be very proud of.

I can't wait until next quarter. I have a new ST coming, along with a video digitizer so I can include student photos, etc. within the paper. But, as for the bulk of the work, we will still use my 130XEs, as the students are very comfortable with them, and they know how to use the software.

By the way, if you do not have Daisy Dot II, here is the address of Roy Goldman: 2440 S. Jasmine, Denver, CO 80222.

If you would like to order a disk packed full of Daisy Dot II fonts, or disks of Public Domain Printshop fonts, please send $3 to cover duplication costs to G.L. Ray, Vice President, Tinker Atari Computer Enthusiasts, P.O. Box 668, McLoud, OK 74851.



A MULTISCAN MONITOR FOR THE ST

by LeRoy Valley (TAG)

The Atari ST has three resolutions — low (320 x 200), medium (640 x 200), and high (640 x 400). Low and medium resolutions support color and operate at 60 Hz. High res supports monochrome and operates at 70 Hz. Due to the difference in resolutions and screen refresh rates (60 Hz vs 70 Hz), Atari decided to offer two monitors. Unfortunately, the SM124 monochrome monitor ONLY supports high resolution, and the SC1224 color monitor ONLY supports low and medium!

Many users would like to have all three resolutions available. The color monitor is great for goodies like Spectrum 512 and games (we mustn't forget games!), and the monochrome monitor is excellent for desktop publishing, word processing and working on clip art.

Currently there are two ways to do this. You can either purchase both monitors or use a software package (like OmniRes) that emulates the resolutions that your monitor doesn't support. There are drawbacks to both methods. The first requires sufficient space for both monitors and a switch box (unless you'd rather plug and unplug cables each time you switch). The second is inexpensive and works, but high res on the color monitor is fuzzy at best, and low and medium res on the mono monitor lack color!

A third alternative has now been offered by Void Productions. Using their Synapse box ($119), you can connect virtually any MultiScan (or MultiSync) monitor to your ST. A MultiScan monitor is capable of automatically adjusting it's refresh rate to that of the incoming signal, thus it can work equally well at 60 Hz or 70 Hz. This allows you to run ALL three resolutions on ONE monitor! Since most MultiScan monitors have resolutions in the 800 x 560 range, they are more than equal to the task of providing you with an image that is comparable to either of the Atari Monitors.

The Synapse is a multipurpose switch box (2" x 8" x 6") that controls your monitor(s) and your floppy drives. On the front of the Synapse are two push buttons labeled FLOPPY and MONITOR. FLOPPY allows you to switch between two disk drives, and MONITOR allows you to switch between mono and color modes. The Synapse is capable of acting as a monitor switch for the Atari monitors (similar to Monitor Master) as well as switching between modes on a MultiScan monitor.

Looking at the back of the Synapse, we find a variety of ports to plug goodies into. Ports available include:

- ☐ A 9 pin port to connect a MultiScan monitor.
- ☐ A VIDEO out jack that provides a sharp black and white picture in low and medium resolution.
- ☐ AUDIO out to connect to an external sound system.
- ☐ MONITOR IN.
- ☐ MONOCHROME monitor out.
- ☐ COLOR monitor out.
- ☐ FLOPPY IN.
- ☐ FLOPPY A out.
- ☐ FLOPPY B out.

Along with the Synapse, Void Productions also sells the Mitsubishi AUM1381-A Diamond Scan, a 14" MultiScan color monitor ($525) with a built-in tilt and swivel base. (Note: you can also purchase the Diamond Scan directly from any of a number of distributors mentioned in Computer Shopper for about $500. Keep in mind though, that Void Productions also gives you a cable.) The Diamond Scan offers a maximum resolution of 800 x 560, a .31 mm dot pitch, and the ability to scan up to 75 Hz. This enables it to handle the 70 Hz mono mode easily.

The first thing I noticed about the monitor was it's SIZE. It's larger than the Atari monitor (about 2" in all three dimensions - HxWxD) and considerably heavier. Both Atari monitors have a 12" screen, thus the Diamond Scan offers 16% more screen!

Hooking up the monitor was a snap. Simply plug the ST monitor cable into the Synapse, then connect the monitor to the MultiScan port. The system booted up fine, but something seemed to be missing. I got it - no sound! Searching the monitor (and the manual) carefully, I discovered that the Diamond Scan monitor has no speaker!

I called Void Productions and talked to Dennis Sita (he's their technical guru). At this point I found that the people at Void are very helpful and knowledgeable. He informed me that he didn't know of any MultiScan monitors that had a speaker. (Now you know why the Synapse has an AUDIO OUT jack.) Oh well, I guess you can't have everything. I simply connected the Synapse to my stereo to rectify the problem.

I tested the monitor in color mode

first. The larger screen is impressive and compares well with (read: looks better than) the original JVC monitor from Atari. When comparing it with the current Goldstar monitors that Atari is shipping, there is no comparison!

A basic test I've always used on Atari color monitors is to run Spectrum 512, then look at the color palettes. On the old JVC monitors, the last of the color palettes (the smallest palette consisting of seven colors) is barely visible. Most of the newer Atari monitors (Goldstar) can't even display this palette! The Diamond Scan monitor displayed the last palette clearly, and Spectrum pictures looked gorgeous.

Pushing in the MONITOR button on the Synapse causes the ST to reboot (it triggers the mono detect line) and switch resolutions. The first thing I noticed is that mono mode was VERY impressive on a 14" screen! At this point I would like to note that the Diamond Scan is the ONLY monitor that offers automatic sizing between modes. Most other monitors would display a very small mono mode picture, requiring you to manually readjust the picture size.

The mono display is just as clear and sharp as the SM124. There is no discernible jitter or flicker, just a rock solid picture. In fact, I think it's better than the SM124. PageStream looks fantastic on this monitor when it covers the full screen! Spectre 128 users are going to love how well Mac screens look on a 14" screen.

In summary, if you really need access to all three resolutions, then this is the way to go. The cost of the two Atari monitors and a switch box are about equal to the cost of a MultiScan monitor and a Synapse. (Of course, you do need some sort of sound system...)

If you don't plan on using a MultiScan monitor, the Synapse is still a good choice to use as a monitor and floppy switch box. And you can always add a MultiScan monitor later!

Void Productions has tested several monitors with the Synapse and those that work include:

- ☐ Imtec 1455N Mitsubishi Diamond Scan
- ☐ NEC II Samsung CN4551
- ☐ Sony 1390A Tatung 1495

Void Productions is constantly testing new monitors with the Synapse, so if you have any questions about a particular monitor, please call them.

Synapse	$119.00
Diamond Scan 1455N	$525.00

GFA Artist

by Donavan Vicha

Program by Dirk Van Assche and Dan Van Agtmael $79.95

Copyright 1988 by Donavan Vicha

I've struggled with this animation/drawing program for close to three months so when the upgrade board on my new (pre-owned) 520ST went south, I took it as a sign that it's time to get this review written for better or worse.

GFA Artist is another import from Germany that seems to typify the German attitude toward GEM: avoid at all cost. The cost, however, in this country, is that users are left with a nonstandard interface for the program. Add to this their typical inadequate documentation due to translation difficulties and a glossary approach to describing functions and no tutorials concerning animation, and you have a program with a long, difficult learning curve.

This is really too bad, because GFA Artist contains some truly unique and unusual features that make it awfully appealing for creating animations.

Although it requires a full one-Meg/color setup to run, you can create animations of up to 2000 frames. The 1500-frame demo runs nearly four minutes, so quite a lot can be done on the Megas if all is compatible.

If you've got the time (or the understanding of computer animation from using other programs/computers) for trial-and-error learning, this is a program to investigate.

I would also like to comment that the name of the program is misleading. The description on the box would lead you to believe that this program is similar to Spectrum and Quantum Paintbox, which are strictly paint programs that allow you to use many more colors than the ST was set up to provide.

The 1024 colors that you can use with GFA Artist are available in a cycling mode that can be used to rework D.E.G.A.S. and NeoChrome art files, but cannot be used outside of the main program -- there is no slide program for viewing your multi-color creations. While you can create NeoChrome and D.E.G.A.S. formatted files, the main features of this program emphasize animation. A more appropriate name would have been "GFA Animator" rather than "GFA Artist."

Awkward Interface and Inadequate Docs

If this program had appeared for the Macintosh, it would have been condemned and left to collect dust on dealers' shelves. The ST community appears to be quite a bit more tolerant of programmers who don't bother following GEM protocols than Mac users who demand that all of their programs follow the same rules for using menus, dialog boxes and such.

There are quite a few ST programs that depart from the "standard" GEM protocols and several of those are very powerful and highly acclaimed programs (PageStream, WordPerfect and DEGAS Elite come immediately to mind). So there is hope for this program, I suppose.

GFA Artist opens to a screen with familiar rows of function boxes (icons) that give access to nearly 60 functions. Although the icons are not all familiar, this looks at first glance to be something that can be worked out rather painlessly. But then using the icons proves not to be as straightforward as they first appear. To choose an icon, you must hold down the left mouse button (LMB) and slide through the three rows to the function you want. The icons are highlighted in this manner; it takes a click of the right mouse button (RMB) to activate your choice.

Now all this can be worked out eventually, but each time you've completed an action, you're returned to the icons. If you want to draw several boxes, circles or lines, you have to rechoose the icon after each item is drawn. Further complications to this process enter in when you decide to change the color of the tool you've chosen. To my mind, this arrangement is downright annoying and makes me resist wanting to get used to its interface.

A different set of commands is accessed for creating films. Both sets of commands can be brought forth using the F1 and F2 keys. The F1 functions are definitely more difficult to grasp due to the way in which this program handles putting together its animation sequences. The docs do a better job of covering this area, but are still incomplete in bringing about understanding to the novice user. More on the F1 commands later.

As mentioned already, the annoyance factor is heightened by the glossary format of the documentation. Each function is described adequately in a listing that follows the order of the icons as they appear in each row.

There is an index, so you can look them up easily enough, but there is nothing written here that ties the functions together into something a novice user can understand. While there are appendices concerning creating a film, merging films and using the run-only interpreter (allowing you to distribute your animations without the main program), these are very mechanical descriptions that give little understanding of the program's animation functions.

Here's an example of the vague nature of the docs:

A GEM bit-blit function may be required because "in some cases it may be necessary for certain functions to operate at the highest possible speed." Which "certain" functions are they referring to here? The docs go on to state that "in general, we advise not to activate the GEM routine." Wouldn't it have been simpler and less mysterious to either state which functions really require this option or drop it, building the bit-blit routine into the functions that require it?

Finally, there is the unusual nature of this program's setup. You must boot this program without any accessories or other memory-resident programs — it uses all the bytes your system can spare. It is run in medium resolution, but only produces low resolution files.

To quit the program, you must power down your system in order to ensure that the memory is completely cleared. GFA Artist definitely takes liberties with TOS and GEM and must run on its own. One wonders if it will be able to run at all when the new ROMs become available for all STs.

Exceptional 3D Effects and Other Features

If you plow through the program and play with its drawing commands, you quickly realize that whatever mistakes have been incurred with the interface and docs, the drawing capabilities are powerful and complete. Along with the usual drawing tools like lines, sprays, boxes, ellipses, cut/copy/paste, fills, arcs and such, there are some unusual features that stand out from anything offered by other paint programs.

Just about anything you can create with GFA Artist can be used as a paintbrush for maximum effect. Horizontal and vertical flips can be accomplished along with a combined flip, each with its own icon. Part of your picture can be bent vertically or horizontally to good effect as well. You can draw the shape of the bend or choose preset amplitudes of 1/2 Sinus, 1 Sinus or 2 Sinus (and are these terms correct? Sine?).

For more precise copy/cut functions, you can choose to "lasso" parts of your picture rather than the usual boxed rubber-band function. You can also capture a part of your screen to create globes, or vertical or horizontal parallelograms. You can rotate a captured part of your screen as well as create an animated rotation effect. If your shape is round or box-like, you can specify a number of sprites and create a zoom effect going from small to large or large to small — the number of sprites determines the number of stages in the overall smoothness of the transition.

The really impressive effects generated by this program follow a similar path. When initiating the animated version of the following functions, you choose the number of sprites to be used (5-15 sprites seems to work well). You then outline the image to be transformed and then it can become a vertical or horizontal drum (cylinder shaped) or its perspective can be enhanced vertically or horizontally for a simple 3D effect, as an animated sequence. These effects can also be created in static, non-animated form. With a little trial and error, these are marvelous effects that can be instituted quickly and easily.

The drum effect turns your captured image into a cylinder-shaped object that you can size simply by moving the mouse, causing a wire-framed image of a cylinder to rotate and grow/shrink. If you're in the animated version, you also choose the placements around the drum where the sprites will occur — the more sprites used, the more detailed your "spin" will be.

I can envision how this drum can be rotated and stretched out across the bottom of the screen to create a moving roadway or a star map rolling over and over under the sprite of a spaceship. It's a terrific effect.

Other Features

The two single-sided disks that come with this package include two proprietary fonts and a font editor program, the run-only interpreter that allows you to run your films independent of the main program, demo files for a demo film and a 1000-color demo screen. Also included is a film merger program that allows you to splice together parts of a film that is otherwise too big to run on a single-Meg ST.

The usual disk management commands can be accessed within the program to rename or copy files and format disks. NeoChrome color cycling is supported, and all popular color paint program formats are automatically loaded into GFA Artist for use as background screens for your film. Any resolution conversions needed to make the picture compatible with the GFA Artist format are automatically performed during the loading process.

You can use up to four different workscreens and easily move from one to another with one of the icon commands.

The F1 box commands are used to put your film together. These allow you to define a sequence of frames to be used, as well as other film editor functions for inserting, moving, copying and deleting frames from a sequence. You can load in up to four background pictures for use with your film. You can group sprites together to define their relationship as a single sprite, making them easier to handle in creating your film. You can call up sprites you've already created and saved and set up their sequences of movement. And you can take full control of each frame, creating layers for the various components of your file (e.g., background as layer 3, a tree in foreground layer 1 and a body walking between them as layer 2), setting start and finish frames and setting speeds. The default is 10 layers, so there is ample room for sprites to move around each other.

These functions are the real guts of the animation side of the program, and they seem very complete. Since you are going to have to do a lot of trial and error just to see what kinds of effects can be created, I am happy to report the awkward interface is less of a problem with the F1 functions than with the 60 F2 icon set. But the docs really leave you out in the cold here.

Instead of such a vast amount of trial and error in figuring out special effects and film editing shortcuts, the docs should provide tutorials or checklists for achieving them.

Conclusion

I am not familiar with the Cyber Studio array of programs that are purportedly the state-of-the-art in animation software for the ST, nor with other animation programs like Aegis Animator or MichTron's Make It Move. I can make no comparisons as to ease-of-use factors among these programs and GFA Artist. I have seen animation films created with all of these programs, however, and the demo for GFA Artist is completely blown away by what I've seen done with Cyber Studio and Animator.

A lot of the effects that GFA Artist provides were not really used in the demo that comes with the package, so it may not be completely fair to write it off on this basis. I have not seen any other demos for GFA Artist, however, so there's nothing to show the real potential of this program.

I have to call this review a toss-up as far as any recommendations go. Computer animation is a complex process and requires detailed documentation that really communicates to the user, and the docs here fall short. The interface for using the splendid features of GFA Artist can be very annoying even when you get used to it. The wide range of colors provided by the program are of very limited utility, so this program fails as a paint program in spite of many unique drawing tools. In sum, GFA Artist is a disappointment.

COMPUSCRIBE is the name for the Editorial and Design Services provided by Donavan Vicha, 7044 North Rockwell, Chicago, IL 60645. If you need help in writing, editing and/or producing professional documentation for your software, please send an introductory letter and he'll be glad to work with you for a reasonable fee. Donavan Vicha was a regular contributor to the now-defunct ST Applications magazine and is currently a staff columnist for ST X-Press magazine.

For 520ST. 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.

Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A: Socketed, no RAM	$ 129
520B: 1 MB, socketed	$ 249
520C: 2.5 MB, socketed	$ 495
520D: 4 MB	$ 795
520-1: 1 MB, non-expandable	$ 199
1040A: 1 Bank sockets, no RAM	$ 110
1040B: Fully socketed, no RAM	$ 149
1040C: 2.5 MB + 1 bank sockets	$ 495
1040D: 4 MB	$ 795
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 3-22-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.

* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.

* a reset button on the keyboard makes a warm reset easy.

* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.

* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible

* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.

Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.

Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available! Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Atari Interface Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

Fishin' Around by Brent Fisher

This month I predict that Tim Sharpe will predict that I will predict that we will predict that predictions will take place this month. I realize that this would have been a prefect April fool's column but as you might have guessed I am writing this in April so it counts (sortof?). Anyway, on with my past and not so future predictions that really came true.

-First I predict Michigan will not only play Seton Hall for the NCAA Men's Basketball Championship but that they will win by one point — how's that for a great prediction. So now all of you who know a bookie tell him Brent sent you.

-Next, I think that the Columbian coffee supertanker, the Juan Valdez, will spill more than 10 million gallons of coffee into the Pacific ocean causing sealife and divers in the area to become stressed out and hyperactive. Now you've heard it, just don't tell Exxon.

-I also forsee a new music recording label emerging called AMS or Atari Musicians Syndicate. After all, they are going to need one if Atari keeps booking all of this major talent for their computer shows. In fact, they might even need a new slogan like "Atari and music, can you believe it?" Maybe, but I don't know.

Had enough of these predictions? Ok, ok. I get the point, but you have to admit it was kind of fun anyway. One prediction that I had made in the past was that Jimmie Boyce's Atari Writer+ column would be done and ready to send to Unicorn Publications. This has come true and the articles will be sent as soon as I get all of the material from Jim.

It looks like both of the Atari shows scheduled for Michigan are going to be huge successes for all involved — especially the users who attend the shows. You probably will be reading this after the MACE show but hopefully before the World of Atari one.

Another thing of importance I should mention is that I probably won't be at the next meeting because of contractual complications, i.e. I am going to be working, but if there is a way, I'll be at the meeting. Since I'm on the subject the next meeting will take place on Sunday May 14, at 1 pm.

One unfortunate piece of news that I should pass along is: A couple of months ago AIM ran an article that stated Atari was allowing users to send in their old equipment, namely 1050 disk drives and Atari would send back a brand new XF551 in it's place. Well, it seems Atari still has a back stock of 1050s so if you send one in you will probably receive one in its place. But don't despair, if you call Atari it is possible they will run out of the old drives in the future.

Those of you who happen to be reading this in our old newsletter will notice that the newsletter has changed a bit in its format. I hope you like it. James Tackett has agreed to published and layout the newsletter using a program that he did himself. Those of you at the last meeting I am certain will agree and everyone there did that this is a much better way to go. Those of you at the magazines that we send this to every month, if you are interested in more information, just contact us at the above address and we will see what we can do for you.

Some of you may or may not have noticed that Jimmie Boyce is no longer editing this fine publication. He has dropped from the post so that he can devote more time to his family and so that he can use his computer for more productive things. Just remember Jimmie, I still have the high score on Mirax Force.

For this month this is Brent Fisher signing off, and I should like to have all of you who even glance at this come to the meeting.

ProCopy ST BACKUP UTILITY

You can't backup your software because copy protection locks you out. **ProCopy** is the key!

- Protects against the accidental loss of expensive software
- Works with all Atari STs
- Copies both S/S & D/S disks
- Use with 1 or 2 disk drives
- Not copy protected
- **FREE** shipping and handling
- **TOLL-FREE** telephone number
- Updates are only $12 with return
- Orders shipped same day
- Disk analyze function included

CAPITOL HILL ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

GENESEE ATARI GROUP

Serving the Flint area

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Inc.

GAG meets on the second Wednesday of the month at the Neithercut school, located at 2818 Crestbrook Drive, Flint. (Off Atherton between Hammerberg and Van Slyke). Meetings begin at 6:30 pm. All are welcome. GAG is a participating member of the Atari Interface Magazine, and members can purchase subscriptions at a greatly reduced rate. GAG is also affiliated with the Great Lakes Atari Digest, and members receive a free subscription with their membership. Membership is $15 per year for the family.

GAG has an exceptional public domain library of 8- and 16-bit software. Contact one of the officers to receive a complete catalog. GAG also has a large magazine library for use by it's members, including Antic, Analog, ST-Log, Start, and several others. We do not support piracy, Piracy is theft!

For more information contact:

FACTS BBS		736-3920

President's Corner by Leo Sell

Writing for the future is always a challenge. No less so this month. By the time you read this, the Michigan Atari Computer Expo, sponsored by MACE, will have taken place. Congratulations to MACE for a successful show. And many thanks to the officers of MACE for their hard work in bringing the various vendors and their great deals to us here in Michigan.

We're now looking forward to a different style of show – the World of Atari show coming up on June 24 and 25 at the Dearborn Hyatt Regency, sponsored by ST World. The World show is the second large Atari exposition in a continuing series of shows taking place around the country. The first was held April 22 and 23 at the Disneyland Hotel in Anaheim California. Most national Atari vendors and developers were there, many of them announcing and displaying their newest products and offerings. For instance, both the GCR cartridge and the PC Ditto II were expected. Chances are good that most of the same vendors will be at the Detroit World of Atari show. Make sure you're there to see the best, brightest, and newest offerings in all Atari computers including the 2600, 800/XL/XE and Game System, and the ST and Megas.

Along with major Atari developers and vendors, we expect Atari at the World show. CHAOS, GAG, MAGIC, and GLASS are participating as sponsoring clubs and will be at the show as vendors. Other clubs can make arrangements to be there at a club section. These shows are causing major excitement in Atari circles across the country. You won't want to miss it.

Happy Atari-ing!

Last month I received a call from Dennis Shingledecker from Oscoda, Michigan. It seems there are a number of folks in his area who are Atari fans, mostly from the nearby Air Force base. Because the members are always on the move, it was hard for them to keep a regular user group active. So he asked if it would be possible to start up a "branch" of GAG in his area. After discussing it at last month's meeting, the members gave the go-ahead. The Oscoda group will meet on the 2nd Wednesday of each month at Dennis's house, located at 4766 Interlake. Arrangements are being made to use a building on the Air Force Base, and details will be given out later. For more information, call Dennis at 739-4434. They now have a copy of the entire GAG library for their use. Welcome to the club!

My thanks to Randy Ferrier for his MIDI demo at the last meeting. This month's newsletter contains the first (I hope) of many MIDI articles by Randy. It should have been in last month's, but I somehow botched up and never sent it in to the editors. Sorry again Randy.

A final reminder that we need volunteers to help out at the World of Atari show on June 24-25. I was a little distressed at the lack of participation for the MACE show, and I hope you can fit a few hours into your busy summer schedule. We also would like to borrow your computer to loan to the vendors. If you can help out call Jerry Cross at 313-736-4544.

That's all for now, see you at the next meeting.

GKAUG GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets on the second Saturday of each month at 11 a.m. in the Dewing Hall, Room 305, on the Kalamazoo College Campus, corner of Academy and Monroe. Dues are $25/yr and include a subscription to Atari Interface Magazine.

President	Frank Fellheimer	657-6106
Vice President	Dan Youngs	
Treasurer	Dave Bryant	
Archiver	Dave Oldenburg	
SysOp	Alex Stevens	
GKAUG BBS		(616) 657-2665

Our April meeting went off without a hitch... except for the fact that we were missing the disk drive to do our demo of "Cheat" by Alpha Systems. I blame it all on our Archiver, who was more interested in making an extra buck than attending our all important GKAUG meeting... and he forgot the drive too! We spent the rest of the meeting discussing some "secret tips" on Donkey Kong Jr., Ghostbusters, Preppie and Caverns of Mars... Yes, we still play some of these.

I figured that more people would have been out to the meeting, but they weren't. Only about six of us this time. If it keeps up, we will end up with only those people that are really serious about working with the ATARI computer, and we won't need a scheduled meeting for that. We had two ST users at the meeting, but No ST. It looks as if there is no one available now to organize them. We will provide the forum for operation, but you users will have to get together.

Next month, 13 May 89 we will try to discuss new hours of operation, you need only let me know your thoughts on this and they will be considered. We are always able to change things a bit. We will also be doing a demo of "Cheat"... I finally made it through Shamus Case II using it. I also have the Version 1.2 of the Converter. We can look at that too.

We welcome Bill Berner as the new Librarian, he will be the one to contact in the event you need something from the library. Dale Vincent is working on a new career in Florida. We wish him the very best in his endeavors. We are still looking for someone to take the Treasurers job. Bryant has done a great job for some time now and has other activities he needs to complete. Call me, its not hard.

Frank

Great Lakes Atari ST Support

'GLASS', Michigans only 'ST' only Users Group

I ♥ my ST!

Meetings - First Thrusday every month, 6 p.m. to 9:30 p.m., Athens High School, 4333 John R, Troy, Mi., 1/10 north of Wattles <17 Mile> - Room 1528 - Mailing Address - P.O. Box 99737, Troy, Mi. 48098 Phone - (313) 828-1653 after 4 p.m. - Steve Mileski, president

Dues - $1.00 per month, ie:join in April - pay $9.00, all memberships expire on January 1, each year. Non-members welcome at no charge.

GRASS GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

Next Meeting: 6:30 P.M. Wednesday, 7 June 1989. Wyoming Public Library. 3350 Michael S.W.

Gerry Borysiak	Director	(616)896-9358
Charlene Bird	Director	(616)795-3593

President's Monthly: 17 April, 1989

With this column, we are now going to include the minutes from the last meeting for those who did not get to attend for some reason or another.

Another first is the inclusion of the calculator that Gary Heitz finished. It sure looks like a calculator, and from the use I gave it this past weekend, it works like a calculator too. Good work Gary. US doublers are available on a first come, first served basis until we run out. If you missed the May meeting, contact me and see if there are any left.

Well the weather is getting warmer. To those not attending the meetings this summer, I wish a warm one (not too warm), and to those who find time for their 8bit, see you at the meetings. One more thing. I have just received the new COM file for Textpro 3.2, which is made to work very, very well with SpartaDOS. Keep an eye on your favorite BBS for it in your area.

Meeting Minutes

Tim opened the meeting discussing the Michigan Atari Computer Expo to be held May 6 & 7 in Romulus. Tickets are available through the club, and I posted a message on E.T.X.E. BBS for anyone interested in carpooling to the fair.

Tim announced another deal thru ICD. They are offering US Doubler chips for the 1050 disc drive for $20, a pretty good deal. Gary Heitz finished programming and showing the calculator program. Some of the functions include printing to printer, % functions, sign changing, error trap, and disabling the break key. Really a sharp program. Thanks Gary!!

Chuck noted that the Kermit program (VT-100 emulation) is now in our library. A demo of MACH-DOS (which is in our library) was done by Tim along with the Desktop program from the ETXE BBS. Both would be a good addition to any home computing library.

The GRASS electronic questionaire program was shown and everyone should complete their data on this disk to update the club's records. Next month we will have a demo of the ETXE BBS via VCR, along with a modem to be raffled off. Don't miss the May meeting!!

See you next month,

Bob Bulliment

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)
MACE East	(313)978-1685	(3/1200)
The College Board	(313)478-9647	(3/12/2400)
DownRiver Outpost	(313)675-4660	(3/12/2400)
Molin's Den	(313)420-0407	(3/1200)

March General Meeting Minutes

The March general meeting of MACE was called to order by Meeting Coordinator Bob Retelle at 7:45pm on Tuesday, 3/21. Bob displayed some of the graphic demo disks from the ST Library (Robb's "Little Computer Demo") and some programs from the 8bit library including Prism Magazine and Air & Sea Patrol.

Bob also noted that copies of DOS XE from Atari are now available in the club disk library, courtesy of Atari Corp., and copies of the manual may be ordered by sending $13.50 to Atari Corp.

President Bill Rayl discussed the continuing effort to execute the MACE Atari Show, to be held in May. Many of the Michigan user groups are now planning to attend, and the list of vendors is growing rapidly to the point where much of the floor space is already committed. Bill noted that no money has yet been taken from the club treasury, and further noted that Sig Hartmann of Atari has stated "Atari WILL be at both shows..." referring also to the upcoming ST World of Atari show in June. Some of the vendors who are already committed to attend: ICD, Alpha Systems, Microdaft, Innovative Concepts, Mars Merchandising, Total Control Systems. Also, Derrick Mihocka (ST X-Former) and Robert Puff (8Bit ARC, DiskCom3) are planning to attend and display their wares.

Bill then fielded questions from the membership about additional details and specifics. Pattie then continued the discussion and asked the persons interested in working at the show contact her after the meeting to be put on the schedule, thus qualifying them for the "gold card" program (a bonus discount from normal show prices at the various vendor booths during the show.)

Bill then discussed some of the currently available templates for use with popular spread sheet programs that aid the user in performing calculations for the '88 tax year. Mike Olin briefly discussed The Tax Advantage by Double Eagle Software, and made a copy available for interested members to play with after the meeting.

After a brief intermission, Bill and Bob discussed current news in the Atari world. Bob talked about a Sinclair Spectrum emulator for the ST that is currently available in Europe. This emulator performs true multi-tasking, and can run an IBM emulator. There was also some lighter discussion regarding lawsuits between Apple Computer, Apple Corps and Macintosh Labs.

April Minutes — The April meeting of MACE was held 4/18/89 at the Southfield Civic Center. The meeting was called to order by President Bill Rayl who spoke briefly about what's new in Atariland. The most popular news is the pending release of the sequel to Dungeon Master, but the room fell silent when Bill announced that United Computer had gone out of business. (Even Ed and Todd were quiet for a moment... MOST unusual!) Probably some of the most significant news lies in Cindy Claveran's disappearance from the Atari lineup.

Bill proceeded to demonstrate PageStream, announcing the package he was using would be raffled at the end of the meeting. Bill showed some of the tricks and tips that make this program fun and easy to use. Brian Cassidy, of Windsor WAUG fame, walked away smiling as several people attempted to suggest he'd NEVER get commercial software past Customs on his return trip and that he should consider their $10 offers to sell.

Convention Coordinator Pattie Rayl led a discussion about the upcoming MACE Atari Show. Using PageStream to show some of the forms and paperwork she has used to-date, Pattie gave a detailed description of where the various vendors would be located in the main room, followed by a similar description of the secondary room that will "house" additional vendors. Many doorprizes are planned including disks, holders, software and even a 520STfm system. Pattie then fielded questions from the members, made a plea for persons to help at the show AS WELL AS at the MACE booth, and then distributed flyers/maps showing how to get to the Hilton Inn at Metro Airport.

After a brief intermission, 8bit Librarian Ted Newkumet demonstrated the MACE New User Disk, a compilation of various "necessity" software (word processor, DOS hints and tips, and the like...) for new members which includes a ton of Help files. The disk is completely auto-booting and well thought-out.

The next meeting of MACE will be held on May 16th, which will feature the annual MACE Birthday Party, so make plans now to attend and help MACE celebrate its EIGHTH (!) year of service to the Michigan Atari community.

Michael Olin MACE Rec. Sec'y

TINKER ACE OF OKLAHOMA

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at PO Box 7697, Moore, OK 73153 or at the TACE BBS (405) 793-7980, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Corrrespondence - $15.00.

President	Michael Beard	(405) 793-7978
Vice President	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Greg Yelle	(405) 390-9184
BBS SysOp	Michael Beard	(405) 793-7978
Technical Advisor	Ron Hamilton	(405) 387-5649

The View from HQ. by Michael Beard

The BBS was transferred to Rick Spencer's house on the 12th of April. Until the 10th of May, the old number is forwarding all calls to the new number which is (405) 755-9561.

Speaking of training, I will not be running for any office next year in the TACE club. I sincerely hope that the members of the club to come to the aid of their club at election time, which is coming up soon. The July meeting is the date for elections. I will remain a member of TACE, as I feel it is one of the best clubs around. What with the over 60meg BBS, and the best newsletter of any club in Oklahoma, why not stay a member? As for the new Officers, it's up to you folks!

Secretary Report by Stephen Moffit (CIS 75006,2204)

Happy April Fool's day! Not much happened at the meeting this month. We did learn that Michael Beard will most likely have to give up the "Sysop-ership" of the TACE BBS, and as such the number will be changing. It should remain within the local dialing area (a rather large area, anyways). (Note: The new number is (405) 755-9561). The reasons for the change are many, but the main one is Michael Beard is moving on Base (Tinker) and cannot afford to move the board on the base with him.

Some replacement springs for the ST's keyboard was sent to the President recently — they are meant to give the keyboard the feel of the newer Mega STs. These springs are also adverised as working on the 130XE. The name of the company is Regent, P.O. Box 14628, Long Beach, CA. 90803, (213) 439-9664.

A double-sided disk full of Print Shop<tm> graphics was made available for the disk-of-the-month. GOE was still not here, I suppose we must assume that it will not be here anytime soon. 'Til next time.

P.S. Remember that officer elections are coming up real soon...so if you are interested in a position, please say so. Remember, someone has got to do it, and our president is NOT running again next year (2 years in a row is enough) so someone else will have to. Go for it, folks.

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the second Saturday of every month at 2 p.m. at the Rudy Zauel Memorial Library on the corner of Shattuck and Center in Saginaw. Upcoming meetings are scheduled as follows: May 13, and June 17, 1989.

LeRoy Valley	President	686-6796
Marty Schmidt	Treasurer/Secretary	792-6029
Al Jennings	ST Disk Librarian	790-1980
Ted Beauchamp	8bit Librarian	686-8872

Club dues are $20.00 per year. For this fee you get the Atari Interface Magazine, support for both the 8bits and ST's, and full access to the clubs public domain library. We currently have 150 8bit disks and 50 ST disks. 8bit disks cost $1 each, and ST disks cost $2 each. Check your mailing label. If you need to renew or you haven't even joined yet, then do it now!

Letter from the Prez

Summer is just around the corner, and so are the TAG elections. This brings up the instinctive "Not-Me!" syndrome, and (to date) science has not found a cure for this strange User Group based malady. So how can you tell if you are afflicted with this disease? Simply look at the following symptoms:

1) The first symptom occurs when volunteers for monthly activities are asked for. "Not-Me!" syndrome is exhibited by various methods including (but not limited to): Slinking down into your seat to escape detection, Staring vacantly into space, and talking disinterestedly to your neighbor.

2) The second symptom occurs when members are asked to volunteer to fill long term positions. At this point, the individual becomes much more creative and vehement! The first major sign linked to this symptom is the old "Let's get the guy that did that last year to do it again!" trick. When this fails, the infected party then falls back on the even older "Nominate others before they nominate you!" gag.

3) The final (and often fatal) symptom occurs when the infected party (generally nominated by someone before he could nominate them) finally realizes there is no graceful way out. At this point he either begins the road to recovery (by accepting the position), or he stops coming to meetings and dies a slow and painful death due to withdrawal.

In conclusion, if you want to avoid this terrible disease, simply volunteer! I'd like to see someone to make a run for President this year. If that happens, then I'll make a run for ST disk librarian and try to finally get our disk library rolling...Remember, it's up to YOU!

STill to Come!

The month of May will come rushing in like a C programmer... Say what! That's right, Tom Wheeler will be demoing GST-C by GST Holdings Corporation, the makers of First Word Plus. The club picked up this package at a very reasonable price, and it will be raffled off following the demo! LeRoy Valley will also show some sample C programs after Tom is finished, and will pass out some copies of source code.

Neil Demo will finish up the meeting with a demo of Final Assault by Epyx. This is an action/adventure game that pits you against the elements.

And, maybe, just maybe, there'll be another disk of the month!

RelicST to Relish!

As promised, Steve Volker demoed Art & Film Director. This package includes both an excellent art program AND an animator! Art Director easily surpasses the capabilities of Neochrome or Degas Elite. You can do things like overlay two pictures, then scrape away part of the top picture to reveal what's underneath, use a section of your picture as a brush, and even cut out irregular sections! The art program alone is superb!

Film Director then allows you to animate your pictures, and even allows you to add a sound track! Art & Film Director is a superb package and well worth every penny at $79.

The meeting closed with LeRoy Valley demoing some of the goodies on the April disk of the month.

Equipment volunteers for May:
ST Neil Demo Color Monitor
Tom Wheeler 1040 ST
8 Bit Ted Beauchamp Computer and disk drive
Hank Kaufmann Monitor

Remember, if you're bringing equipment, please bring all of the necessary cables (such as power cords, monitor cords, mouses, etc.).

The April meeting of the Washtenaw Atari Users Group was held on April 11 at State Street Computer in Ann Arbor. President Jon Brode gave one of his best renditions to date of "Hear yea! Hear yea!" and then proceeded to announce that Treasurer Dick Selke was home at last from his extended visit to Arizona. (Dick, of course, received a round of applause and was immediately besieged with questions about how much of the club treasury got spent in AZ.! Dick smiled, knowingly, and denied all charges...)

Dick gave an in-depth report of the status of the treasury, and recapped his analysis of the financial activity which took place during his absence. The treasury has been fairly stable for the past 10 months.

ST Disk Librarian Russ Crum announced the Disk of the Month special contained printer-driver development utilities, a vertical/horizontal screen dump driver, a print spooler, and several combination RAMdisk/Print Spooler drivers. Eightbit Librarian Mike Millage announced his Disk of the Month contained Daisy Dot II. Both Mike and Russ proceeded to demo these items later in the meeting.

Jon introduced Jay Shuler, a visitor from MacTechnics (a Macintosh-oriented organization from Ann Arbor) who spent about 30 minutes discussing the possibility of starting a coalition of cross-platform user groups. The idea is to create a link between Mac, NeXT, Atari, Amiga and other computer user groups in the area "in an effort to educate and inform." Jay specifically mentioned a jointly-produced newsletter, group purchases of disks, a mutually funded/operated BBS, and (best of all?) legitimate IRS status as a non-profit organization. Jon invited Jay and/or another representative of the organization to attend the next WAUG officer meeting and further discuss plans and ideas. Questions were fielded from the members and many of them seemed to think the idea to be workable, and were interested in hearing more details in the near future.

Vice President Howard Chu announced he had made arrangements for the club to meet at the Michigan Union (State Street, at South University) starting in May. He has arranged a board room and some A/V equipment for future meetings. There is a parking structure located just behind the union building.

Member Pattie Rayl, representing MACE, discussed progress of the upcoming MACE Atari Show (5/6-7, to be held at the Hilton Inn at Metro Airport). Tickets are now available for advance purchase. Dick Selke put in a plea for members to volunteer time manning the WAUG booth, and also for persons to help work the show.

Jon displayed samples of the Great Lakes Atari Digest (GLAD), a publication looking very much like the original Michigan Atari Magazine (MAM). GLAD is being produced by MAM's originator, John Nagy of CHAOS. John noted that the publishers of GLAD were seeking new subscribers. WAUG members currently receive Atari Interface Magazine as part of their membership privlages. The members seem to be satisfied with this arrangement, so it was decided that any members wishing to subscribe to GLAD should meet with Jon after the meeting to get signed up.

Michael Olin Sec'y

From the Treasurer

Hi, I'm back! If some of you didn't know, I've been on vacation. Al W. Jones renewed his membership. Hope to see you at MACE Expo, Al!

Speaking of the Expo, we now have our membership cards. Be sure to pick your card up at the Booth before purchasing anything so that you can get a group member discount. We received a lot of compliments on the member cards. A big Thanks to Richard Schrader for the WAUG Logo design, and thanks to Maria of Jerry's Printing on Wayne Rd. in Westland, for being so helpful and efficient. We can use all the HELP we can get at the Booth, volunteer when you can, but stop by and say Hi.

If you are wondering how the Group is doing financially, we had a deficit in Dec.88 of $70 (purchased blank ST disks and games for door Prizes). We made a $1.60 in Jan. '89, a loss of $4.85 for February and a profit of $4.05 in March. When we took over in June, '88 we had a balance of $234.48. We now have a Balance of $241.65.

See you at the Show!

Dick Selke

Ask NostraTIMus by Tim Sharpe

Have you noticed how boring Atari columnists have become lately? Sheesh, it seems like every time I flip through an Atari magazine I find a plethora of old, regurgitated, time-worn articles...the situation has even degenerated to the point where self-righteous columnists are writing columns complaining about how boring other columnists are!

This month, I offer subject matter that I KNOW will be new and informative —the future! Here are my predictions for the remainder of 1989:

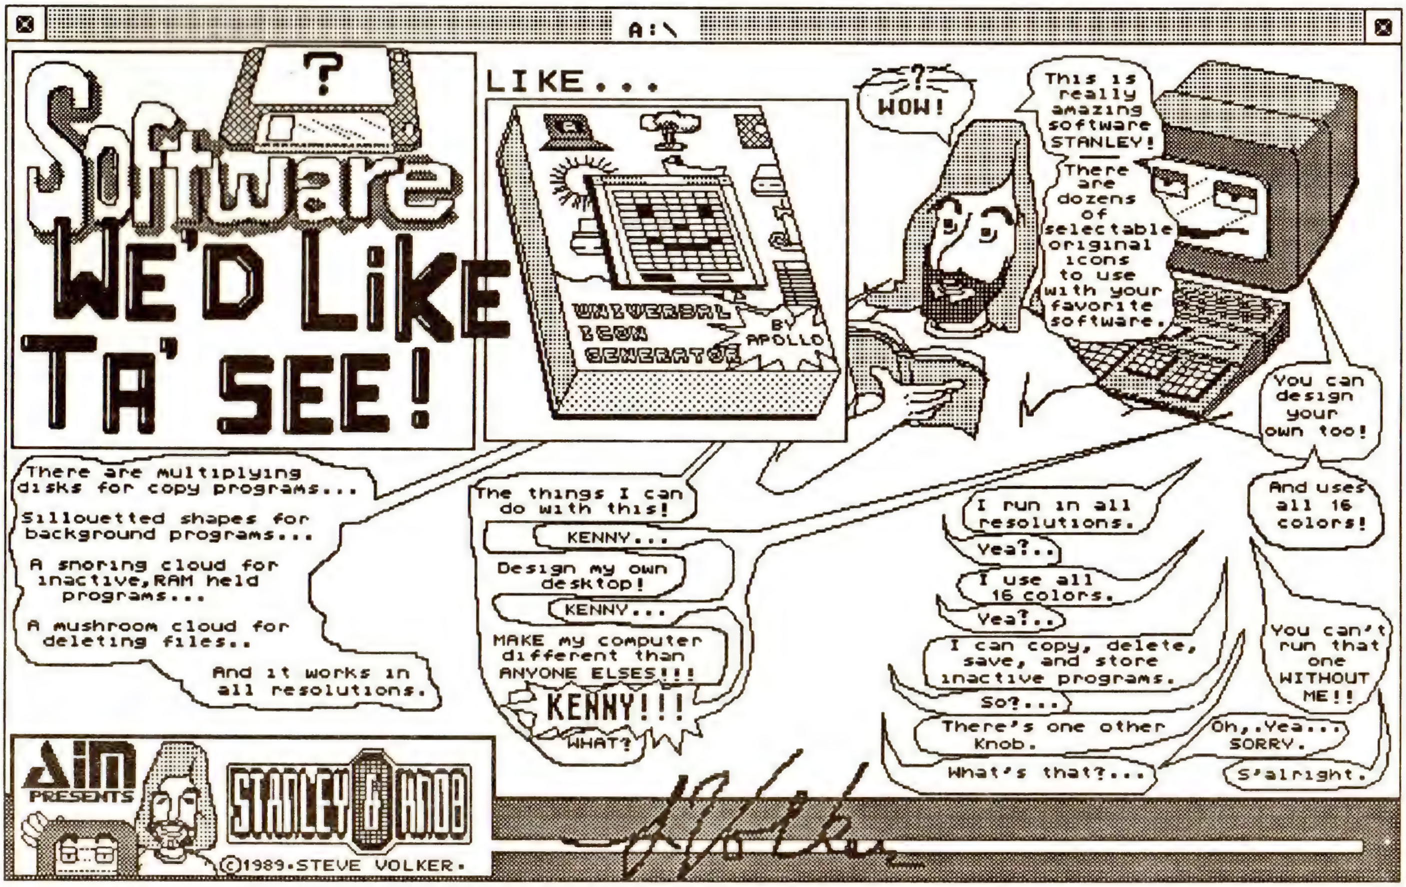
A game called "PAC Man" will be released by Atari. PAC will stand for "Political Action Committee," and the object of the game will be to maneuver either a US Senator or Congressperson around the screen and gobble up bags of cash placed there by Big Business. Atari will announce that the highest scorer in the nation will win a free breakfast with Lloyd Bentsen (A $10,000 retail value).

An anti-Atari book will appear on bookshelves soon, causing such an out cry in the Atari community that Jack Tramiel will put a $5.6 million bounty on the head of the author.

The cargo ship "Juan Valdez" will run into an underwater reef and spill 10 million tons of coffee concentrate into the waters near the coast of Brazil. The "fish'll be jumpin'" as the coffee slick oozes its way onto the Brazilian shoreline. Environmentalists will be outraged that the captain of the vessel had been drinking shortly before the incident, and that the crew failed to sober him up because they ran out of coffee. President Bush will dispatch troops to the region to clean up the mess, and the paper towel industry will reap enormous profits.

Elvis Presley will be seen in three different computer stores in Michigan at the same time -- and at each store he'll buy a MEGA ST.

In May, a high-ranking CACE official will predict that I will make these predictions.



A:\
Software WE'D LiKE TA' SEE!
LIKE...
UNIVERSAL ICON GENERATOR
BY APOLLO
? WOW!
This is really amazing software STANLEY!
There are dozens of selectable original icons to use with your favorite software.
You can design your own too!
And uses all 16 colors!
There are multiplying disks for copy programs...
Sillouetted shapes for background programs...
A snoring cloud for inactive, RAM held programs...
A mushroom cloud for deleting files..
And it works in all resolutions.
The things I can do with this!
KENNY...
Design my own desktop!
KENNY...
MAKE my computer different than ANYONE ELSES!!!
KENNY!!!
WHAT?
I run in all resolutions.
Yea?..
I use all 16 colors.
Yea?..
I can copy, delete, save, and store inactive programs.
So?...
There's one other Knob.
What's that?...
You can't run that one WITHOUT ME!!
Oh,.Yea... SORRY.
S'alright.

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

Digisound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only $39.95

Polydisk Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

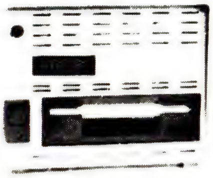
Astra gives up !!!

No we are not going out of business... We are going out for business !!!

The demise of many Atari dealers, and the reluctance of many more to carry much inventory forces us to announce:

Astra Systems goes Factory Direct !



SYSTEM HD+

Our original offering for the ST computers is now available in 20, 30, and 40 megabyte capacities. With precision double sided 3 1/2" microfloppy and its tough construction it ranks as the one to beat.

SYSTEM HD+ 20	$849.95
SYSTEM HD+ 30	$919.95
SYSTEM HD+ 40	$1069.95

RM 60/120 & RM 80/160

Our rack mount units for the MIDI musician fit portable and permanent racks.

RM 60	$1295.00
RM 60/120	$2095.00
RM 80	$1995.00
RM 80/160	$3495.00
EXPANSION 60	$ 875.00
EXPANSION 80	$1595.00

THE EXPANDER

A truly expandable hard disk system. Not a chainable one as many competitors are offering. Contains space, cooling, and sufficient power supply to handle up to 120 megabytes of storage inside the under-monitor case. Built-in surge protection for its 4 AC outlets. Controls the CPU and peripherals from the front of the unit. Optional precision double sided 3 1/2" microfloppy. Twenty, thirty, and forty meg units.

EXPANDER 20	$759.95
EXPANDER 30	$819.95
EXPANDER 40	$999.00

Editorial Ramblings

In the May issue of Atari Interface Magazine, we wrote one paragraph taking an online publication (ST*ZMAG) to task for its inaccurate reporting of events that were to take place at the now-passed MACE Atari show. The ST*ZMAG issue in question stated that Atari would not have a booth at the show and no Atari representatives would be onhand.

At the time our editorial was written, Atari had confirmed that they would have two booths at the MACE show, that they would pay for these booths and that there would be Atari representatives at the show. At that time, Mike Dendo had stated that either he or Joe Mendolio would be at the show to represent Atari U.S. Joe Mendolio also said he would contact Atari Canada to see who they could send to the show.

As always, predicting what the future may bring (especially where Atari is concerned) is never easy- for online publications and magazines alike. However, at no time did Atari state they would not have a booth or have representatives at the MACE show.

Atari did indeed have two booths at the Expo, and the booths were paid for in full by Atari Corp. Atari Canada executives Julius Oklamcak and Saliesh Patay attended the show Saturday as official representatives. Finally, though neither Mike Dendo or Joe Mendolio attended the show, Atari did contact Dave Horton of InCom Marketing, Atari's midwest Product Representative, and requested that he and his staff officially represent Atari U.S. at the show.

In closing the editorial in the May issue, we stated:

"The Michigan Atari Computer Expo will be over just about the time you read this, and contrary to any misinformation spread by a certain online "publication," Atari has stated they will have representatives at the Expo. At least one Atari U.S. executive has told us he will be at the show, and there will even be some Atari Canada execs at the Expo. Looking at that online publication's track record, the Atari community should be used to the factual inaccuracies they present. Perhaps that's why some online users have nicknamed them Z*Rag and ST Z*Rag?"

This statement was taken as a direct slam by Ron Kovaks, Z*MAG Publisher, who contacted us about his concerns. The nicknames Z*Rag and ST*ZRAG first appeared in discussions on one of the major online information services and were not invented by us, contrary to the implication made by Leo Sell, president of CHAOS and co-publisher of the CHAOS/GAG newsletter which is financially affiliated with ZNet (see "From the Readers' Viewpoint"). The closing of the May editorial was not meant as a "slam," though we can understand how Mr. Kovacs interpreted it that way. To Mr. Kovacs and the Z*Mag/ST*ZMAG Staff, we sincerely apologize for printing a statement that you felt was derogatory to yourselves and your publications. Now, we ask you to apologize to MACE and MACE officers for your past false statements.

From the Reader's Viewpoint

Please be so kind as to print this letter in its entirety or to phone me if you refuse. I will be placing it in other appropriate sources of Atari news.

Dear Editor:

I found your "Editorial Ramblings" in the May issue to be extremely distasteful. Your unwarranted attack on Z*Mag and ST Z*Mag was both uncalled for and unprofessional. Such conduct is unbecoming to any user group newsletter or similar magazine and engaging in such attacks only serves to weaken the Atari community here in Michigan.

Frankly, I don't understand why you would make such provocative statements, especially in light of the past troubles between you, user groups, other publications - online or otherwise, and questions about your statements and policies.

Incredibly, your own statements made in the editorial belie your call for accuracy. You made several statements about Atari corporation plans, executives and the MACE show which were supposed to support your contention that other information had been incorrect. You stated that Atari Corporation attended the event and that "at least one Atari executive...will be at the show".

I think it significant that even as you accuse another publication of inaccuracy, you keep your statements vague (for instance you did not name the Atari executive that would "be at the show"). Atari Corporation was represented by their area Business Rep, who is NOT an employee of Atari, but of INCOM Marketing of Columbus Ohio, and by Michael Groh, area MIDI Marketing Rep, who has his own marketing company named JAMM. There were no actual executives or employees of Atari Corporation.

The same thing is true of your statement about Atari Canada executives. No such executives were at the Atari booth, and even had they been at the show, I doubt they could officially represent Atari Corporation. Both trade rules and corporate policy would likely rule it out.

In short, and in light of your questionable statements, you owe Z*Mag and ST Z*Mag a retraction and apology. Your reference to "some online users nicknaming them Z*Rag and ST Z*Rag" is pretty thinly veiled. It's not clear whether those users are simply you or who they are. I will say this, I check in on the services too and I have not seen such a reference anywhere except in your editorial.

I presume that, if I had a problem with you, you would expect me to bring it directly to you, and not make up names or insults to print in other sources. Please extend other publications the same courtesy that you would expect.

Leo Sell, CHAOS President

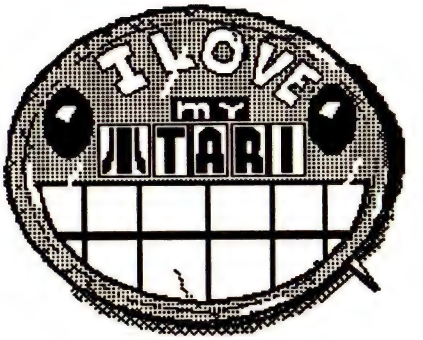
[Editors' Reply: Leo, when the editorial in question was written, we were predicting the future, since our deadline was several weeks before the Expo. It wasn't until just a few days before the show MACE learned no Atari Corp. Executives would be attending, even though MACE had been assured they would by Sig Hartmann, Mike Dendo and Joe Mendolio. Instead, Dave Horton and Doreen Needham of InCom Marketing were officially designated by Atari US to be Atari's show representatives.

As for Atari Canada Execs, Julius Oklamcak and Sailesh Patry were there, most of Saturday wearing official badges as representatives of Atari Canada. The Zmag issue we were referring to stated Atari would not have a booth. This was wrong, and Atari even PAID MACE for the booths Zmag said they didn't have! At NO TIME did Atari ever say they would not have a booth at the show.

I don't understand how it is unprofessional to report what users are saying on the services...to which you say you subscribe. I also don't know how, if you indeed frequented all the services, you could have missed the big discussion of Zmag and STZmag on one of them. There is no thinly veiled insult, simply passing along of information.

Having participated on CIS and Delphi on a weekly basis and attending nearly every weekly conference on these systems, we have NEVER seen your participation, Leo.

We also take offense at your implication that we wouldn't print your letter. Unlike the publication you champion, we do print views dissenting from our own.]



Atari News and Comment

by Bill and Pattie Rayl

Joe Mendolio, Atari's new Vice President of Marketing, has also been named Atari's user group liason, taking over the position vacated by Cindy Claveran in April of this year. User Groups wishing to contact Mr. Mendolio can reach him at (408) 745-2010.

Atari Canada reportedly received two of the new Atari Portfolio computers, a sign that the "world's smallest IBM compatible" is close to market and should meet its June release date.

Some stores in the US are already taking advance orders for the VCR tape-sized computer that comes with 128K RAM, and built-in MS-DOS 2.11, BASIC, word processor and Lotus-compatible spreadsheet.

Though not for everyone (especially with 40 column by 8 line display, RAM card software access only and a price tag of "just under $400"), this little "AA" battery-operated portable has caused a stir in the computer industry and should sell well.

ST Hardware Products

Third-party products that expand the ST's power and flexibility are just now hitting the market.

At least three different 16 mHz accelerator boards are nearing release. Attendees of the recent MACE-sponsored Atari Expo got a chance to see one of these boards in action at the DataFree booth.

Their board fits into any ST and can be switched on or off with an external switch. Giving an overall average 30 percent speed increase, the accelerator "does not use a RAM cache, this making our upgrade fully compatible with all software."

According to DataFree, "some programs change code at random" and using an accelerator with a built-in RAM cache could cause program crashes. The DataFree 16 mHz Accelerator may be available by the time you read this and retails for $199.95. Call DataFree at (416) 741-9825.

FaST Technologies of Andover, Massachusettes, is also nearing completion of their accelerator board that provides approximately 35 to 40 percent speed increases and should sell for around $400.

The May, 1989 issue of ST Informer carries an excellent article on the board, with photos and benchmark speed comparisons. FaST Technologies can be reached at (508) 475-3810.

Finally, from John Russell Innovations (JRI), makers of GenLock, comes an accelerator board that reportedly will cost only $99.95.

Another product from JRI is a small board that gives your ST a 4,096 color palette. Installation is as simple as unplugging the ST's video shifter chip, placing the chip onto the board and plugging the board into the shifhter's original socket. The board retails for $49.95 and is available now. JRI's phone number is (415) 458-9577.

Online News

GEnie SysOp Holly Stowe recently left the Atari Roundtable (RT) for a position in the Gadgets by Small RT. Replacing Holly is Jeff Williams, of Software Plus, a chain of Atari stores in Illinois. Drop in on the weekly Wednesday night Conference (10 p.m. Eastern) and welcome Jeff aboard!

Not to be outdone, CompuServe's Atari ST Forums recently added Antic Software's David Ramsden to their already capable staff of SysOps. David can usually be found in the Thursday night Conference (10 p.m. Eastern). If you want to know anything at all about Antic's Cyber series, David is an expert on the subject.

World of Atari

The World of Atari show to be held at the Hyatt Regency Dearborn in Michigan is only a couple weeks away. The most recent press release says Atari Corp. will have over 10 representatives on-hand and the STacey laptop will be on display.

The show will also give Michigan its first look at the Spectre GCR and pc Ditto II emulators. With a larger show area than the Anaheim show (and more exhibitors too!), the show promises to be an event you won't want to miss. Call (503) 673-2259 for more information.

As reported in the May, 1989 issue of the Puget Sound Atari News, plans have tentatively begun for a World Of Atari show in Seattle, Washington. As reported in that publication, "Although no firm date has yet been set, [Rich Tsukiji] did say that a Seattle show was the #1 priority for the August 26-27 weekend of 1989."

The Michigan Atari Computer Expo

by Pattie Snyder-Rayl (MACE)

Whew! I am glad the running around organizing an Atari show is over! The show was a success, in all aspects, and was a credit to the Atari Community in Michigan.

Members of MACE, the Michigan Atari Computer Enthusiasts, can be proud of what our club has done for the User Group Community in Michigan and throughout the country. MACE held our heads high and produced our show despite lots of dirty politics playing in the background in an apparent attempt to stop our User Group-sponsored show.

As I said before, the Expo was a success. Many vendors told me they sold more in one day of our show than during the whole World Of Atari show in Anaheim, which was billed as the "Atari Event of the Year." This made them extremely happy, and made MACE happy too! Even those vendors who didn't outsell other recent shows were very satisfied with their sales because their costs to attend our Expo were much less, therefore, they didn't have to sell as much to make the show worthwhile.

John Eisvoog (CodeHead) & ICD's Tom Harker (right)

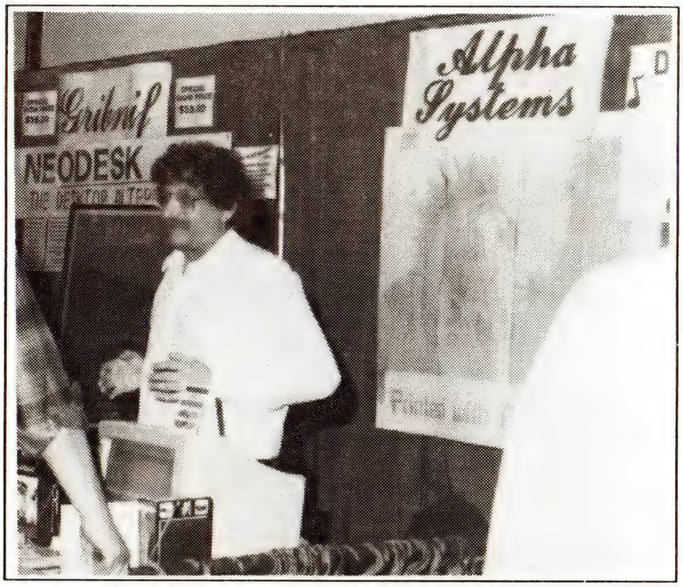
SofTrek's Wayne Buckholdt talks with Bill & Pattie Rayl about the Expo

Tom Harker, of ICD, told me, "MACE should be proud of the show you've put on. It's a very good show. You've done a lot to make vendors like me happy, and it shows." Craig Thom, also of ICD, said "The show was more fun than I thought it'd be! I'm glad I was able to come."

Wayne Buckholdt was very impressed with the way MACE organized the show to cater to the exhibitors. "You really planned things well, with the site of the show right near the airport. This means a lot to the developers coming from outside the area. The shuttle service saves us the expense of a taxi or a rental car, especially when we're bringing lots of product and equipment."

MACE made good plans, but even those weren't free from problems. Atari Corp Management, including Sig Hart-

Dave Horton and Mike Groh chat at the Atari Booth



George Morrison of Alpha Systems

mann, Mike Dendo, and Joe Mendolio assured me several times each that there would be an Atari Executive at our show. Unfortunately, Atari did not come through on this simple gesture, and did not supply even the needed computer equipment promised for use at the Expo. However, Atari did send payment for the two booths used at the show. I was not informed of the change in plans for the Atari reps until a few days before the show.

Atari Canada came through on their promises though! Julius Oklamcak, Technical Support and on-line spokesman for Atari, and Sailesh Patry, Marketing Support Manager were both at the Atari Expo and spent considerable time talking to exhibitors and show-goers alike. Also at the booth were Dave Horton and Doreen Needham, the Atari manufacturers representatives for Atari Corp. Dave Horton spent much of his time demoing the ST educational software Atari shipped for the show. Mike Groh was also onhand as the MIDI representative for Atari in our area. He participated in a seminar about MIDI music, which was attended by MIDI enthusiasts.

The final count on show attendance stands at about 1500-1750. The uncertaintly lies in the fact the tickets were good for both days, and many people returned on Sunday which wouldn't reflect in ticket sales. I was hoping more people would come since it has been a long time since Michigan had an Atari-only show, but it would seem the smaller attendance reflects the way the Atari market has been shrinking in the past year or so. It will be interesting, for me at least, to see if the Dearborn ST World

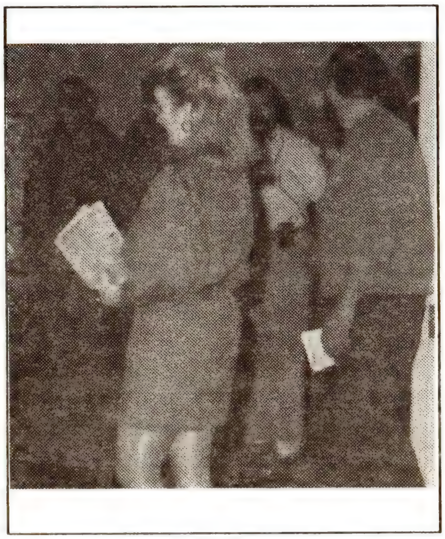
Michigan's own Accustar

show can draw the projected 7,000 people since we drew Users from Pennsylvania, Tennesee, Ohio, Kentucky, Wisconsin, Illinois, Indiana and a few other states, not to mention several cities in Ontario, Canada!

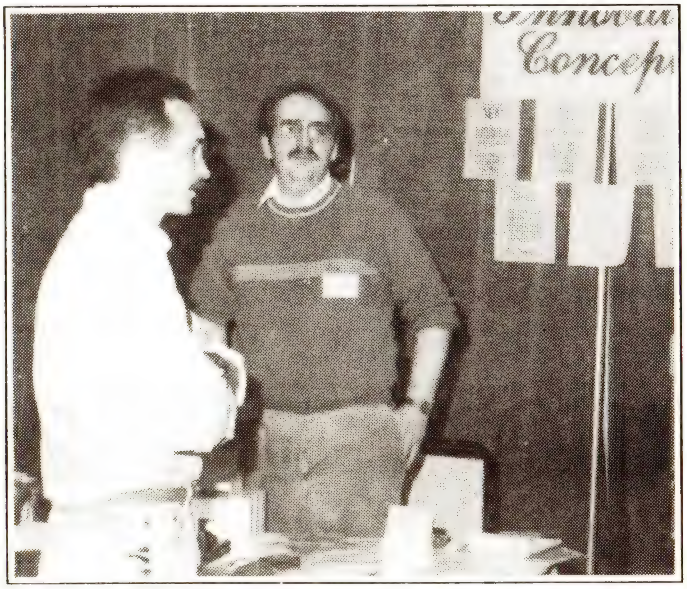
The response from the User Group community for the show was larger than we anticipated, and this resulted in a congested hallway, for which MACE apologizes for any inconvenience. I understand many clubs did very well for themselves at the show. Several user group officers told me they were happy with the show and the response they were getting from show-goers and congratulated MACE on sticking to our guns and holding the Expo.



TAG's Steve Volker keeps an eye on one of Rite Way's Models

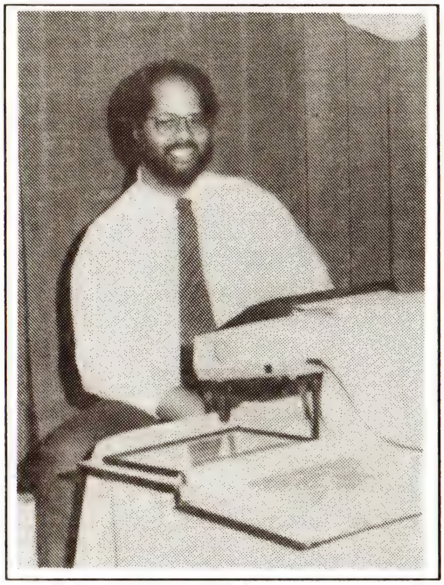
People attending the show told me everything from "This is the greatest show I've been to in six states!" to "This isn't an awesome show, but it isn't a bad one either." I saw many people leaving the Expo with arms full of software and hardware.

On Sunday, Rite Way and CAL COM became embroiled in a price-slashing war, to the benefit of the show-goers, but Joppa Computers, Rentertainment Sector One, Basic Bits 'N' Bytes and Mars Merchandising took the war in their stride and simply offered discounts on their software. Rite Way seemed to be selling lots of hardware (MACE member and CompuServe SysOp Keith Joins went home the happy owner of



Bob Carlini & Innovative Concepts' Mark Elliot (right)

ICD's Craig Thom partakes of the complimentary lunch



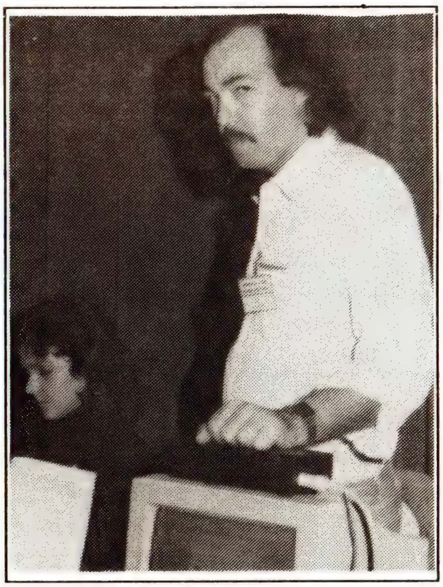
Mike Clayton (Electronical Soft.)

a Mega4!) and offered discounts on software, but the selection was very limited.

Apparently the price war was a bitter one because the contracts dealers sign with Atari say they will not sell hardware outside their area, and Rite Way was angered by CAL COM's selling hardware when they are from Maryland, according to Dave Horton after the Expo. I just saw many happy new Atari owners!

Thank Yous

I'd like to take a moment and thank all the people who helped MACE pull off this Expo, and do it with style and thoughtfulness. Sharie Middlebrook and Don Neff deserve a big hug. Sharie had the enviable task of coordinating all the volunteers for the show. She got to contact all the volunteers and try to coordinate when they could work at the show. Don Neff had fun tracking down exhibitors to see what times they'd like to have seminars and what they'd like to speak about. Then he got to try to schedule all these talented Atari developers into a collection that would interest and provide a variety to show-goers on both days!



Canada's DataFree

Heather Neff deserves a big Thanks for her help at the ticket counter both days, keeping track of the funds and paying our bills, with all the chaos going on around her. Kip Kiefer should get a warm Thank You for his help in coordinating the User Group ticket sales and booth setup. Ted Newkument helped out with the libraries, and an extra Thank You to Ted and Kip and their spouses for help in copying all those BobTerm disks! Thanks go to Mike Olin and Bob Retelle for their work at the Expo, and to Mike Lechkun and Jerry Cross for their background information. The Expo couldn't have gone as smoothly as it did without the Gold Card volunteers, and though you're too many to name here, MACE Officers wish to thank you wholeheartedly for your help and support!

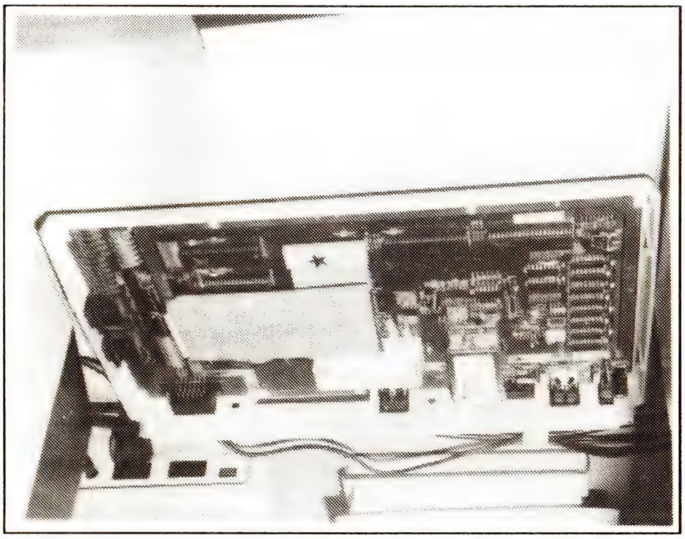
Summary

If you missed the Expo (for shame!) some of the highlights included: DataQue demonstrating their Turbo-816 board that turns an 8bit Atari into a 16bit machine...DataFree of Canada showing off their own 16 mHz board for the ST...MichTron showing off Fleet Street and UltraScript bundles, Alpha Systems with their 8- and 16bit product lines, including the new Beat Box... CodeHead Software showing off the new HotWire shell, along with their other fine ST products...

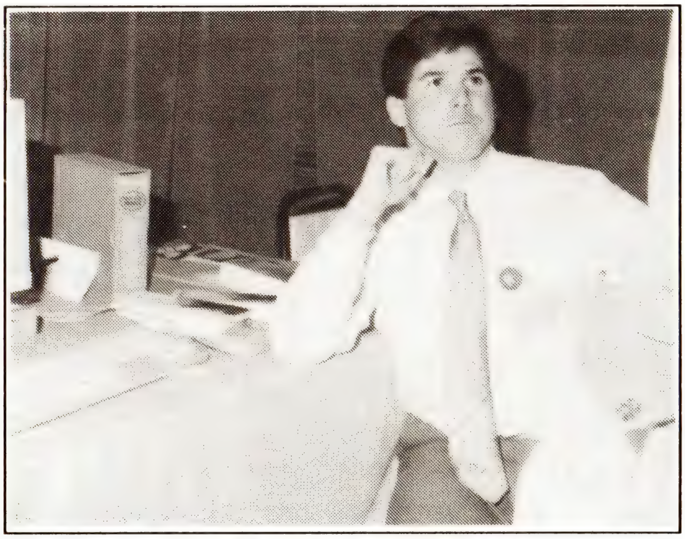
Gribnif was showing (and selling a lot of copies of!) the latest version of NeoDesk (v 2.03)...SofTrek was putting the ST through its paces by demoing TurboST, the software Blitter. A new version of TurboST will available "probably by the end of the year" that gives some really phenomenal speedup! You had to see the demos to believe it!

ICD was showing off their products and doing brisk sales on SpartaDOS X. Tom Harker, ICD President said they had sold all the cartridges they had brought on the first day. WordPerfect was showing their top-of-the-line word processor for the ST...Scorpion/Microdaft was selling their 8bit and ST games...custom-built hard drives were the focus of the Hurricane Systems booth, where an 85 Meg drive was selling for a show special of just over $700.

Darek Mihocka packs the seminar room for his demo of ST Xformer



A close-up look at DataQue's Turbo816 board



Gordon Mella from WordPerfect

Electronical Software had YEMACYB, the excellent 8bit Atari color printing utility...Family Detective was giving free LOGO tutorials on the ST...Innovative Concepts was selling all kinds of goodies for 8bit owners...Nice & Software showed off their CRICIT bar-code reader and cash register software/hardware for the ST.

Ralph Turner was pulling double-duty at the show, representing ST Informer and promoting his "The Atari ST Book." Unicorn Publications was selling "The Lost Scrolls of Mount Anaias," the 112-page Dungeon Master hintbook and copies of Atari Interface Magazine (and back issues of Michigan Atari Magazine).

Pattie Rayl, MACE Expo Manager

Darek Mihocka introduced the latest (and last, according to him) version of his ST Xformer 8bit Atari emulator to a packed seminar room. Bob Puff, programmer of the Super Arc utilities (among other great programs) introduced his new feature packed shareware terminal program, BobTerm. Lucky attendees of the show were able to purchase the first copies available anywhere!

Other seminars included George Morrison of Alpha Systems and Charles Johnson of Codehead Software speaking on shareware software, and Mike Groh, Atari's MIDI representative demonstrated several popular programs for creating music on the ST.

MIDI Rep Mike Groh talks about Music and STs

MACE Officers Don & Heather Neff and Ed Hanson

Some Spellers are Better than Others.

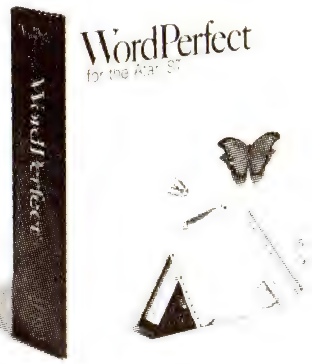
Before she won her regional spelling bee, Margaret Hollingsworth pored over seven different dictionaries for more than three hundred hours.

And while we'd all like to be champion spellers, most of us just don't have that kind of time.

So may we suggest putting the WordPerfect® Speller in your corner.

Not only will the Speller check your document (or any section of it) for errors and double words, it will instantly count the words in a document, page, or block of text.

You can look a word up phonetically to find the correct spelling, and the Speller will give you a list of replacement words with similar sound patterns. Or if you're looking for just the right word, and you know it begins with "s" and ends in "-ology," use a wild-card character to replace the unspecified letters. The Speller will show you a comprehensive list of your options.



With the WordPerfect Speller (included in your WordPerfect software for the Atari), more than 115,000 words are at your fingertips. No other speller can match that kind of power.

Not even Margaret.

A Practical Suggestion to Get More New 8bit Software

by Mark Quigg

Would you like to get more software for your Atari 8bit? Perhaps you notice that people with other 8bits such as the Commodore 64 enjoy an abundance of new games, databases, and more. Here is a way that is GUARANTEED to work. We can make software giants like Electronic Arts, Microprose, Epyx, and many others "an offer they can't refuse!"

The Problem

The Atari 8bit computer, as we know, is an outstanding product: it has very good graphics capabilities, sound, and much more. It includes features not found on most machines, like a full screen BASIC editor. And it is inexpensive!

Yet the market for Atari 8bit software is surprisingly small. Major developers don't support us anymore, for the most part. Why?

I believe there are a combination of factors involved. One is that Atari has a reputation for piracy...the developers fear their programs will be copied, and illegally sold, thus cutting in on their profits.

Another is that Atari Corp. has concentrated their marketing efforts in Europe; they hope to capture the #1 spot in the industry (I understand they have accomplished this in Germany). This means that the parent company doesn't offer as much in the way of commercial advertising and promotion, which is vital to the brand image.

The Solution!

This idea is so simple, yet has such power, it is amazing no one's mentioned it before.

It is this: Write a letter to the companies you want to produce software for the Atari, including the names of several of your friends who own Atari computers. That's all there is to it! Consider this:

In 1988, Universal Studios released a film called "The Last Temptation of Christ." This angered many Christians, and petitions all over the country were signed, and sent to theaters and Universal Studios. The result? Over 1300 theater chains refused to book the movie; Universal lost $12-14 million!

Last year, the Congress of the United States decided on a pay raise for themselves. Editorial pages of newspapers all over the country were filled with letters from irate citizens, opposed to the high raise. Just recently Congress voted on the issue, and decided against the raise by an overwhelming margin.

The point is not to debate the right or wrong of these issues, but that when the people got together and responded, action WAS TAKEN.

You've probably seen the appeals in ANTIC magazine, and other places, to write a letter to the company. I read them, and wondered, "Will they listen to one person? Are there enough others doing the same to make a difference? Will they even take the time to read the letter?" I believe they will. Atari users wrote to Springboard, and they were compelled to translate "Newsroom" for the Atari.

The advantage of including several names of your friends with Ataris is that it represents paying customers to the company. They will definitely stand up and take notice.

If you work for a business that services the Atari community, you could actually send your business mailing list to them (name, city, and state only will protect your customers and you). This can easily result in THOUSANDS of names!!

What To Do

1) When you get a chance, upload this text file to your local BBS's. No need to go out of your way; just keep the disk handy, and do it the next time you happen to log on. If you could upload to 1 or 2 long distance boards (if you are calling them already anyway), it would be very helpful. Remember that this will help your u/d ratio as well.

2) Take a few minutes to think of people you know that use Atari 8bits, and write them down or type them in. If you can get their personal signatures, this is the best of all. However, just entering their name, city, and state should be fine.

3) If you are involved with a user's group, you might share this article with them...a large-sized group can go far in impressing a profit-seeking developer.

The Effect

It is my hope that this file will be distributed across the country. If only 200 people respond, with a list averaging 10 names, that's 2000 names of consumers to persuade the developer. However I believe many more will respond, and provide even larger lists...users groups could be a good source of many names.

If only one or two large companies respond with new software, this will be an incentive for others to join in as well. After all, they don't want to lose their share of the profits available.

A Sample Letter

Following this article is an example of a letter you could send. A few points are important:

Specify which titles you want produced. This gives the developer a starting point. The best to choose are ones already made for the Commodore 64, since they would be easier to translate.

Include a statement to the effect "I don't pirate software, and encourage my friends not to as well." This can help shatter Atari's image of being a pirate's computer.

With the names, only use the person's name, city, and state...not the street address...unless you get permission to do so. Also you can only include names of people that actually use an Atari 8bit. You can use people's handles on bulletin boards as well, if you put the name in quotes ("Dr. Kildare") so they'll know you're serious.

DON'T be critical of the company...praise works much better.

You can use the letter as-is, or create your own. A form letter will suffice; you can create one letter, and simply change the addressee for each company.

I've also enclosed a list of many software developers that should be producing for the Atari. You might send to one company yourself, and get your friends to do one each — all using the same list of names.

Sample Letter

Avalon Hill
ATTN: President
4517 Hartford Rd
Baltimore, MD 21214

Dear Sir:

In the past, I have purchased fine programs from you for my Atari 8bit computer. However, I understand that you are no longer producing new titles for these machines.

Won't you please reconsider? Would you consider translating "Super Sunday" for the Atari? Thank you for your time.

Sincerely,

John Smith

P.S. I have enclosed a list of a few friends who also use Atari computers..

Fred Jones, Jacksonville, FL
John Smith, Chicago, IL
George White, New York, NY
Sam Stevens, Los Angeles, CA
"The Bean", Atlanta, GA
Bill Green, Charlotte, NC

Conclusion

I'm putting my money where my mouth is. As the General Manager of Homemade Software, a small company that specializes in public domain software for the Atari, I have access to the mailing list. I intend to send a list of hundreds of names to all the companies on the list; also to upload this file to several of the bigger Atari BBSes in the country.

Do this today, while it's on your mind! It will only take a few minutes, yet could reap BIG rewards in new software.

Company List

AVALON HILL

President, 4517 Hartford Rd., Baltimore, MD 21214 (Programs: Civil War, Incunabula, NBA, Super Sunday)

ELECTRONIC ARTS

Trip Hawkins, President, 1820 Gateway Dr., San Mateo, CA 94404 (Programs: Bard's Tale, Artic Fox, Marble Madness, Skyfox)

SIERRA ON-LINE

President, P.O. Box 485, Coarsegold, CA 94039 (Programs: 3-D Helicopter Simulator, Thexder, Kings Quest)

MICRO ILLUSIONS

President, 17408 Chatwsorth St., Granada Hills, CA 91344 (Programs: Fire Power, Turbo, Galactic Invasions, Land of Legends, Faery Tale Adventures)

MEDIAGENIC (formerly Activision)

President, 3885 Bohannon Dr., Menlo Park, CA 94025

EPYX

President, 600 Galveston Dr., Redwood City, CA 94063 (Programs: Championship Wrestling, Sub Battle Simulator)

MICROPROSE

William Steahley, President, 120 Lakefront Rd., Hunt Valley, MD 21030 (Program: Gunship)

PHANTASM from Scorpion

by Bob Retelle (MACE,WAUG)

Wandering around the MACE Expo with my "Gold Card" looking for bargains, I decided to try one of the games being displayed by Scorpion/MicroDaft. There was quite a variety of games, and with the show specials and special discounts, many were priced less than $15 each. Among their offerings was one called PHANTASM, from Exocet Software, which looked interesting.

The name, and the typically "European" package art (featuring, naturally, a Boris Vallejo style, half-naked woman) has nothing at all to do with the game itself. Likewise, the extremely brief scenario on the sheet of documentation has little connection to what you'll see on the screen. Actually, the game stands on its own without these "marketing tools."

PHANTASM is essentially a "combat flight simulator" arcade game. The graphics are very well done, in a "filled 3-D shapes" style very similar to STARGLIDER II. The game is acceptably fast, even with these complex shapes, with only a little bit of slowdown when the screen displays many large, filled polygons. A nice touch is the "point source" lighting effect, which simulates sunlight, and creates realistically shadowed objects. When facing into the "sun," everything is silhouetted -- almost like driving into a sunset. Travelling over the surface of the planet, you pass from the well lit "day" side to the dark, shadowy "night" side, as you pursue your elusive goal.

The object of PHANTASM, other than shooting almost everything in sight, is to eventually eliminate the eight bases which are spewing out all kinds of nasty enemy thingies, and transport back to your own planet. Your Phoenix fighter-interceptor is armed with both lasers and guided missiles, although the lasers have a nasty habit of overheating and refusing to work until they cool down again (the aliens need SOME kind of advantage after all). By judiciously firing the lasers in short bursts, you can avoid the embarassment of having them stop working just as ANOTHER alien ship pops up from behind a small mountain range. Your ship can carry only nine missiles at a time, but there are arms dumps scattered here and there which will rearm and repair it. An Anti-Missile Beam will destroy incoming enemy missiles (as long as it lasts), and Boosters will help you run away from groups of aliens that are just too large to handle all at once

One facet of games, of which I am usually very critical, is the control of your ship. Happily, the controls in PHANTASM are very good. The joystick is quick and responsive in steering the ship and controlling the speed. Height is controlled by keys on the keyboard, and really comes into play only occasionally during the game. Because of this, the game is much more like a tank simulation than an aircraft simulator, despite the futuristically-rendered fighter craft on the instruction sheet.

Unfortunately, the one area in which PHANTASM is sorely lacking is its documentation. The one, lonely, little card in the packaging gives the basics of which keys do what, and an overview of what the indicators on the screen mean, but very little else. Even those details are often incorrect, as I discovered when I began to wonder what the random seeming dots all over the main screen were. After playing a bit, it became apparent that they are a "heads up" radar display that wasn't even mentioned on the instruction card at all!

What helps to save the situation is that the lowest difficulty level is essentially a "Training Mission" level. In this level, objects which come into range of your lasers are identified in a screen on your instrument panel, giving some clue as to what to do with them. Your ship is very hard to destroy in this level, but you aren't given any score. Three other levels increase the difficulty and point values for enemy objects destroyed, although there is never any indication of how many points each individual object is worth. There are enemy spaceships and tanks, and radar towers and fortresses to shoot, fuel dumps and arms supplies to dock with, and of course, the 8 "re-constitutions" to destroy.

There is a screen showing the entire planet, which allows you to choose your area of conflict, but it appears to me that the game is created randomly every time you play, thus rendering this screen effectively useless. About the only control you have is whether you start on the light or dark side of the planet. The planet is divided up into 64 sections, and each section takes an appreciable amount of time to explore, so a complete game could take a great deal of time. Unfortunately, there is no "Save Game" option, so you must play all the way through in one sitting, or restart from scratch each time.

Played fast and furiously or slow and cautiously, PHANTASM is a nice blend of graphics, playability and value. It combines fast action with strategy and is definately recommended!

For 520ST. 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.
Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A: Socketed, no RAM	$129
520B: 1 MB, socketed	$249
520C: 2.5 MB, socketed	$495
520D: 4 MB	$795
520-1: 1 MB, non-expandable	$199
1040A: 1 Bank sockets, no RAM	$110
1040B: Fully socketed, no RAM	$149
1040C: 2.5 MB + 1 bank sockets	$495
1040D: 4 MB	$795
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with ive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 3-22-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.
Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available!
Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Have You Read any Good Ones Lately?

by Steve Volker (TAG)

Just about this time every month, I become a "MAG-a-holic." Armed with my checkbook and any undesignated money laying too close to my reach, I can be found in any number of bookstores in town, snatching up the most recent issue of my favorite magazines.

I buy all Atari-specific periodicals, anything with the word "computer" in it's title, and will buy any premier issue of anything, regardless of the topics discussed. I'm a magazine junkie. And do I read everyone of them? I sure do!! I read voraciously!

But though I thrive on all the little tidbits of rumor and information found within these many pages, my main reason for buying any of them is for FUN! I seek to be entertained, shocked, enlightened, surprised, titillated, and coddled, by those in the Atari community who seem to know, or be closer to, so much more than I. (As evidenced by their Bylines.)

Still, all this aside (and by way of making some kind of point), I never approached this monthly ritual with the proper respect. That is until the embarrassment and humiliation I felt while reading the June '89 issue of ST-Log.

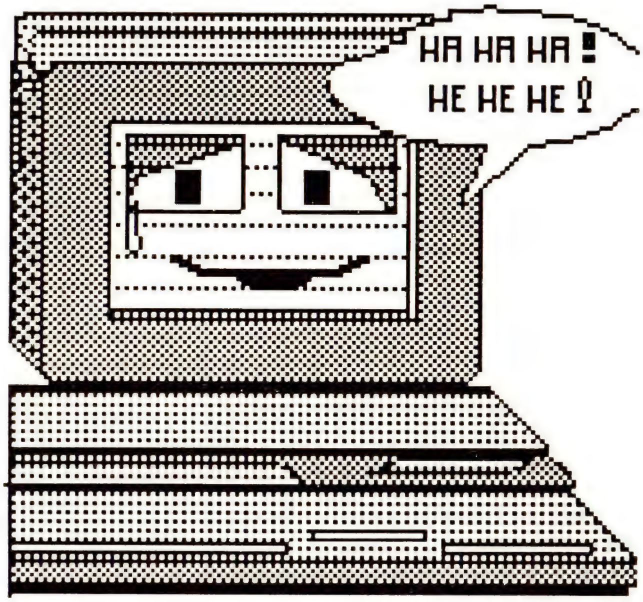
I found it on page eight of this issue, under the heading of Reader's Comment, (and just below the letter about the giant European Keyboard or whatever the h... it was) an open letter from CEO/chairman of Spectrum HoloByte, Inc., Gilman G. Louie, which bears some serious reading.

In short, Mr. Louie tells the tale of their latest (and possibly last) offering for the Atari ST, the FALCON air-combat simulator, from it's official release by Spectrum HoloByte itself, to the pirated released on various bulletin boards around the country, JUST 30 DAYS LATER!!

The rest of the letter talks of the costs involved in marketing software, and the understandable reactions by software publishers who have had their products so caustically stolen, but the thought of such blatant piracy had already deeply shamed me, and prompted me to write this article. If after reading (and rereading) Mr. Louie's letter, you feel as I do (pissed!, frustrated!, ashamed!, @#$%^!), I have a few suggestions as to how you can add action to your righteous indignation:

1. Begin by replacing all pirated and copied programs in your own personal disk library with the same program bought legitimately.
2. Be verbal in your distaste for the practice of piracy, and elect only club officers in your User Group who feel the same.
3. Willingly report any information about pirate BBSes to the respective company being cheated.
4. Support any organized effort to curb and curtail furthur piracy.
5. Most importantly, refuse not to pirate again, and actively support those software publisher's who have continued to support us over the years.

I hope these suggestions are of some use. Er...ah... ahem...excuse me...AIM? Here's your soapbox back...guess I got carried away. (Stanley! Why are you laughing!?)



HA HA HA!
HE HE HE!

Absolute Beginners' Column

by Lew Stone (GAG)

Why is there a notch on the edge of a disk?

This notch is supposed to protect the information stored on the disk. If you cover it with tape, most drives cannot write to that disk, thus keeping it from being overwritten by unwanted data. This is true of 5.25 inch disks, but the 8-inch disks do just the opposite, and the 3.5-inch disks also protect when the opening is uncovered. It would be nice if the drive manufacturers could make up their minds and stick to it.

Some drives are single sided and some are double sided, meaning there are read/write heads on both sides of the disk. Most of us with 5.25 inch single-sided disk drives have found that taking a notch out of the other side of our disks enables us to flip our disk over and use the back side.

Discovering that you have twice as much disk space as you thought is pretty exciting stuff, especially back in those days when a box of 10 cost $50. We had been told by salespeople that single-sided disks can only be used on one side. But which side was that? Apples read/write from the botton side and some other drives from the top.

If you have a 3.5 inch single-sided drive you probably have noticed that many programs and public domain disks are double sided. Sometimes you can get an upgrade for your single sided drive, but most likely you'll find that a new double-sided drive is about the same price.

Home Accounting or Where Did the Money Go?

by Bill Pike (PAC)

Reprinted with permission of the author and the Portland Atari Computers user group. Review copy loaned to the author by IB Computers.

Here is a program that, while it doesn't guarantee a happy household, at least takes some of the steam out of an argument (or maybe it adds to it).

Anyhow, for those of us who are married, one of the major arguments (or at least the loudest) is, "Where did all the money go???"

For those who are single, if this is the cause of an argument with yourself, this program will help you too.

The name of the program is PHA$AR and it is available through ANTIC's 'The Catalog'. The cost is $79.95.

The program supports 50 income categories and 250 expense categories. It also supports money transfers between categories (robbing Peter to pay Paul) and Miscellaneous Expense and Miscellaneous Income sections, for those who have extra income or expenses.

PHA$AR is menu driven and fairly user friendly. For example, if you have an expense that doesn't fit well in any of the existing categories, you can type in the new category and the program will add it to the existing list. The same holds true for income.

One of the strengths of this program is its check balancing features, allowing you to reconcile you accounts. There is also a feature allowing you to keep track of your PLASTIC MONEY.

The above-mentioned features would be enough to make the program interesting, but here are the real goodies:

You can generate reports of expenses/income for each month or a partial year or yearly total.

After several months of data are entered, you can generate a monthly budget automatically and you are allowed to exclude non-typical expenses from the budget categories. This gives you a better picture of how you are really doing.

Graphs can also be generated to show how you are doing financially, rather than trying to figure out what a bunch of numbers in rows mean.

Last, but not least, there also is a program included that will take expense categories you have marked as a tax deduction, your income, and your other expenses and puts all these things together to give you an estimate of your taxes for the year.

However, this may not be good if you want a surprise on the 15th of April. If you don't, it can be a distinct advantage to use the information to adjust your income and expenses for a lower tax bite.

To sum everything up, like any program that will give you a lot of help, this program needs data to work from. If you take the time to enter the data, about 30 minutes to one hour per day, it will make things a LOT easier for you.

I have only seen two programs of this type for the ST and only had the chance to review this one. The only other accounting programs that I have seen have been full-blown business accounting packages and I AM NOT A C.P.A.; I don't think you are either.

So get PHA$AR, enter the data, and use the money that you save on tranquilizers and asprin to take a Hawaiian Vacation.

War in Middle Earth

by Dan Crevier

I was given a copy of War in Middle Earth to review by a friend of mine who received versions for all computers to review, even though he only has an Amiga.

War in Middle Earth (WIME) comes on three single-sided disks. It is possible to copy all of the files onto a hard drive, or onto double-sided disks because the program is not copy protected!

If you own a double-sided drive, but no hard drive, I suggest copying the contents of disk 2 and 3 onto a double-sided disk. This way, you only have to swap disks once. If you do not have a double-sided drive or a hard drive, you are in for a lot of disk swapping.

It is great that Melbourne House did not copy protect the disks, so users can take advantage of their double sided drives and hard drives.

WIME uses a large map that is included in the game for copy protection. Periodically WIME will ask you for the coordinates of something on the map. At first, it may be hard to find some of the cities and landmarks, but after playing for a while, it is no problem locating things on the map. The inconvenience of looking things up on the map is well worth not having copy protected disks.

WIME is based heavily on the Lord of the Rings Trilogy by J.R.R. Tolkien. You control the forces of good trying to destroy the Ring of Power.

To do this, you must bring it to Mount Doom, located in the middle of the evil territory. Along the way, you can supposedly gain the support of other armies to help destroy the ring. I found that after a while they joined me even if I did not try to get their help.

The manual included with WIME has a good overview of the Middle Earth world, so reading the Lord of the Rings trilogy is not necessary. Also, it has a good glossary of people and places.

The section on how to play the game does not make the gameplay totally clear, but it is not hard to figure out. The manual also has some good strategies.

Gameplay in WIME takes place at three different levels. At the highest level is a map of all of Middle Earth which shows the location of all good, evil, and neutral forces.

At the next level is the Campaign map which gives a nice scrolling map of Middle Earth with the different forces shown as different shields or figures. This level is perfect for war gaming. The screen scrolls when you move the pointer to the edge, so it is very easy to move around Middle Earth. It is from this level that you can give commands to the forces that you control.

At the most detailed level is the Animation Level. This level shows fully animated pictures of all of the people and monsters against nice digitized backgrounds.

I found some major problems with the game. The main problem was that you can move units through mountains, rivers, and even partly through lakes.

One of the hardest parts of the game is getting into the area around Mount Doom, which is surrounded by mountains with passes guarded by 10,000 orcs, but it is possible to walk through the mountains and avoid the orcs. Maybe this was intentional on the programmers' part, but I find that it makes the game far too easy.

I encountered another problem. One time I was playing and decided to go straight for Mount Doom. After walking through the mountains to avoid the orcs in the passes, I went to Mount Doom. Mount Doom was guarded by about 2,000 orcs, and I didn't stand a chance, but I went for it anyway. The orcs killed me, but then it gave me the victory sequence, even though I had just been killed at Mount Doom.

Also, I had some problems getting my units to move exactly where I wanted them to in the shortest path.

Even with these flaws, WIME is an entertaining game. It is more of a war game than an adventure game, but still has an adventure feel to it.

I only recommend this game to Tolkien fans who think they would like a war game/adventure game cross, but if you prefer Ultima and Dungeon Master type games over war games, you are probably better off waiting for Chaos Strikes Back or Ultima V.

The Atari Users Association

by Robert Guadagno (AUA)

I would like to take this time to introduce myself, I am Robert J. Guadagno, President of the Atari Users Association (A.U.A.), I am writing you all to give you a better understanding of what the A.U.A. is trying to do for the ATARI community.

Slight History

The A.U.A. was started by myself a year ago back while I was reading an article in a now-expired Atari magazine that expressed how Atari was annoyed at the amount of letters they were receiving from users and user groups making outrageous demands on Atari Corp. for little things.

It went on to say that Atari was hoping to hear from its supporters, but in a more ORDERLY fashion. While reading this (you may say the LIGHT came on) I thought of the Atari Users Association, a group with the sole intention of "merging" Atari users and user groups to form ONE ORGANIZED NETWORK of Atari supporters.

This group (that became the A.U.A.) will NOT "take over" any user group, but, in turn, will take its members' voices, and add them to ours. The Atari Users Association will not PRY into ANY user groups business unless the officers of that group wishes the A.U.A. to do so...The A.U.A. is a support group ONLY, made to better SERVE the Atari community as well as Atari themselves.

Right now the A.U.A. is only 300 members weak! Why weak? There were over ONE MILLION Atari computers sold in the United States and Canada, and as members of the Atari community, we are greatly out-numbered. The Atari Users Association needs YOUR help, YOUR numbers, YOUR voices, to make Atari #1 again.

What the AUA Intends to Do

Write-in campaigns: (quite the same as Antic Publication's "SpringBoard" write-in "News Room" campaign) for better software support for the ST and 8bit Atari computers.

Information exchange: To keep the Atari users informed about the Atari community at large.

Company contact: To talk to the software and accessory companies, to let them know WE are behind them, give them ideas as to what we, as Atari users would like to see (The A.U.A. has a contact with Spectrum HoloByte, and have been speaking to them about the FALCON matter) to show THEM that we SUPPORT them, and will continue to do so.

The Atari Users Association feels that a POWERFUL ORGANIZED VOICE is necessary to communicate our thoughts to Atari, and to the MYRIAD of software and add-on hardware vendors. The Atari community is labeled as being a "risk-group," it is the Atari Users Association's job to STOP that manner of thinking.

The A.U.A. is NOT "waging war" on IBM, Apple, or Commodore, instead we are trying to organize the efforts and the voices of the Atari users and user groups to BETTER the standing of Atari in the computer industry, to let the software companies know that we ARE worth more than one title a QUARTER.

What the AUA Has in the Works

The Atari Users Association has made every effort to talk to Electronic Arts, to get MOST of the software NOW available for MOST computers available for the Atari computers, each call was met with a disappointing end.

The AUA feels that a WRITE-IN organized PETITION to Electronic Arts WILL get results. By sending 10,000 letters of demand at once in one package we will get MORE attention than 10,000 sent in all alone at different times.

I thank you ALL for your time, and I hope you will ALL add your voice to ours.

Sincerely, Robert J. Guadagno
President, Atari Users Association

If you have any questions or suggestions please leave them to me on the FoReM Fnet at NODE 133, Hologram Inc., (201) 727-1914, addressed to COMIC-KID or call (201) 290-2242, or write to us at the address below. THANK YOU!

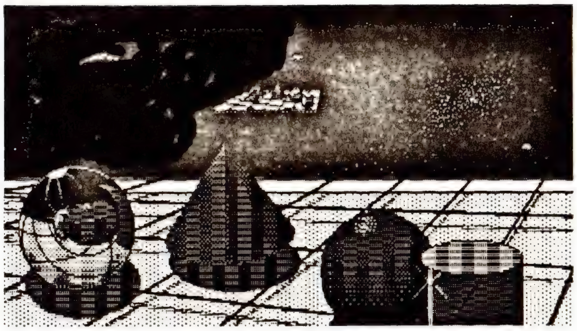
Battle Chess



by Tom Hayslett (STar)

Reprinted with permission of the author and the STar Users' Group

Several months ago, I was at a meeting and we had an Amiga there running a new program called Battle Chess from Interplay. I tried the program for a few minutes and loved it. The first thing I did was get the name and address of the company that put out the game and promptly wrote them a letter requesting an ST version of the game.

I don't know if my letter helped or not, but I just received Battle Chess for the ST by Interplay . What is it? Well, it's basically a chess game but with a twist. The board and pieces are in 3D graphics, and each piece is animated in its own special way. When you move the piece, it walks (or waddles, scoots, etc.) to the square you designated. If the square is occupied, an animated 'battle' sequence follows. The outcome is always as it would be in a chess game, but watching the animated battles (and listening to the digitized sound effects) is very captivating. Each piece fights and moves differently making it interesting to watch the different battles.

Now that you know what Battle Chess is, let me explain the other important things. The game comes on 2 single-sided unprotected disks. There is a backup program included but not just for backup purposes.

The backup program helps you set your backup disks for either a 520 (512K) or 1040 (or MEGA). With a 1040 or MEGA you can put the game on one double-sided disk or as I did, on a hard drive. I put it two folders deep on a hard drive and it works great. You can run Battle Chess from either low or medium resolution and it runs perfectly. I even left all my hard drive 'AUTO' folder programs (and accessories) active and nothing conflicted with Battle Chess.

After the title screen, the game asks for a move to be entered from a table in an appendix in the manual. I prefer this type of copy protection and commend Interplay for it. It's great having it on the hard drive and available at all times.

Moving a piece is simple — point at the piece you want to move and the square becomes highlighted. Click the left mouse button and then any square you point the mouse at that is a legal move will also become highlighted.

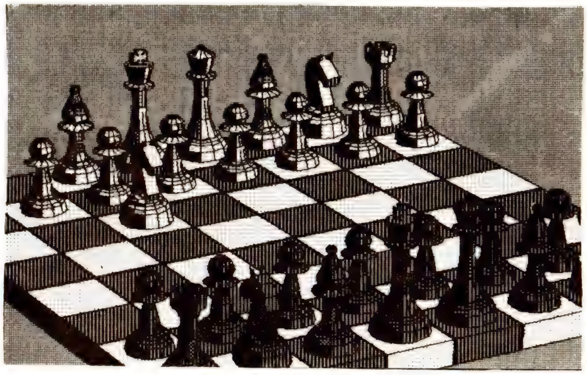
Pressing and holding the right mouse button brings up the animated scrolls (drop down menus) from which you may select many options including load/save a game, turn sound on or off, change from 3D to 2D, set the level of play anywhere between the 10 available levels, and (ready for this?), set up and play via modem or null modem cable! I haven't tried the modem option but it looks similar to Falcon or Jet as far as setting it up and playing.

All the menu options have keyboard equivalents that are shown in the menus themselves.

I'd really like to tell you how good a game of chess it plays but I can't. It seems every time I play a game I can't resist seeing a new 'Battle Scene' and I force a move that I ordinarily wouldn't make just to watch and hear the fight.

Some of these sequences are absolutely hilarious and Interplay has done VERY well with the graphics and sound. (By the way, I think the ST version looks better than the Amiga version!)

If you're a chess player and would enjoy a new 'twist' to the game or even if you're one of those graphic animation collecting folks, you will love this program. Thanks Interplay for the great program and for allowing us to back it up and install it on our hard drives. It's great!



REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

Digisound ST

● ● ● ● ● ● ● ● ● ● ● ●

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

● ● ● ● ● ● ● ● ● ● ●

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. ● The first and only full color digitizer for the ST. ● Uses standard video inputs like video camera, VCR, or video disk. ● Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. ● Pictures can be used with Degas, Neochrome, Powerprint and others. ● Automatic calibration of contrast, brightness and white balance. ● Plugs into cartridge port for easy set-up. ● Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only $39.95

Polydisk Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Atari Interface Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

Fishin' Around by Brent Fisher

Well now, did one and all enjoy Mother's Day? You know that day that we were supposed to have the meeting on. Since I wasn't there, I have no idea as to who, if anyone, showed up. If you did, you already know that I wasn't going to be there, and as it turned out I was unable to attend. So how about next year we move the date around so that this doesn't happen again?

Any way, on to some good and possibly interesting things. Such as, you ask? Well how about a bit of a run down of what I got to see at the Michigan Atari Computer Exposition. Not much to be quite truthful. I arrived too late on Sunday to see any of the conferences that I was interested in. But I did get to pick up a few things at the show that some of you might be interested in. I think that I'll bring with me a couple of the new games that I have purchased. By the way anyone with an ST, if you have Airball, bring it with you. I'd like to see it and compare it to the 8-bit version.

At the show, there were quite a few 8bit vendors in attendance. Those of you who missed the show do have a second chance since the World of Atari show in Detroit is coming up at the end of the month. Hopefully I can go and see some of the seminars this time. But point in fact I do think the show itself went pretty good. There were quite a few people there while I was at the show. David Sullivan was supposed to have been in attendance, but for some reason didn't show up. Well David, are you ever going to release GOE or are we of the 8bit community going to just have to be satisfied with Diamond from your competitor? Anyway, if anyone has questions about the show, get a hold of me and ask, I'll be happy to answer any that are asked.

The next meeting will be on Sunday June 11th at the East Side Lounge. Come and check out some of the new games from Atari.

Ask Tim's Evil Twin Brother by Tim's Evil Twin

This month I, Tim's evil twin brother, have successfully executed a coup against my belligerent little twerp brother, Tim. I was successful because of the number of people reading his column has declined (from three to two), thereby enabling me to take over. Excuse me a moment while I put on my ridiculous colored glasses so that I can report objectivity.

Hey evil twin brother, how do I avoid gouges in my 20 Meg drive?

Oh, you mean 20 mile drive, that's easy just avoid driving on Jackson's stretch of I-94 until the repair crews get done with it.

Hey evil twin brother, I heard that there is a new simulation coming out for the Atari ST's, have you heard anything about it?

You must be referring to the new Coleco Adam simulation, not only do you get to have that fabulous tape drive that made to Adam so famous but you also get the printer. I don't know about the rest of you ST fans but I just can't wait until this one comes out.

Hey evil twin brother, did you hear about the new Star Trek simulation?

Ah yes, the new simulation that allows you to talk your computer into emulating the computers from the old Star Trek series. Among the best things that you can do with it, is the capability to cause your computer to calculate pi to it's last digit and to make it feel guilty about destroying another Federation starship.

Hey evil twin brother, have you heard about the new computer game called 'Drunken Sailors'?

Yes, it's most recent update puts you at the controls of a super tanker to see if you can ship oil through small inlets. I have also heard that you can earn extra bonus dollars from a certain oil company if you can figure out how to spill the most oil.

Hey evil twin brother,!

2&%#$@27.UHHHH Nooo not so SOOON, I'M Stil%'@)249762%&W@%*+-

We interrupt this deranged lunatic to tell you that Tim will be back next month with an all new ASK TIM column. Again we apologize for any inconvenience caused by Tim's evil twin brother.

CAPITOL HILL ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

President's Corner by Leo Sell

Here comes the big one -- the Detroit area World of Atari show, sponsored by ST World magazine in cooperation with the Atari Corporation. The first show was held at the Disneyland Hotel, Anaheim California and was the biggest all Atari show EVER. At 19,000 square feet, the show coming up will have even more sales floor area and will likely have more vendors.

The World of Atari show is June 24 and 25 at the Dearborn Hyatt Regency, near the Fairlane mall. You won't want to miss it. According to the information I received in the mail today, Atari corporation executives scheduled to speak at the show include: Sig Hartman, VP; Mike Dendo, VP of Marketing; Jay Crosby, VP of Software; Joe Mendolia, VP Software-Desktop Publishing. Also scheduled to speak is Mike Groh, MIDI Marketing Rep for this area.

The equipment being shown will include the usual ST and DTP systems, and may include the Portfolio, the STACY, and the TT.

Besides Atari, vendors so far include: Gadgets by Small with their Spectre 128 and the GCR, Avant-Garde with PC-Ditto II, Accusoft, Antic, Astra, Best Electronics, ICD, Intersect, Michtron, MiGraph, Seymore-Radix, SofTrek, and Supra.

User groups that will be participating as vendors and assisting with the show include CHAOS, GAG, GLASS, and MAGIC.

The World of Atari show will certainly be the biggest thing to hit Midwest Ataridom, EVER. See you there.

In other news, CHAOS is moving and combining its monthly meetings. Starting with the June meeting, we will have a single meeting for both 8bit owners and ST owners. The meeting is the third Saturday, at 10 a.m., at the Capitol Federal Savings and Loan, on Saginaw (not Grand River), east of Abbott in East Lansing. Saginaw street going out of East Lansing is the old route to Flint that forks off to the northeast near Frandor. The branch is just past Abbott near the old Win Shuler's resturant. Be sure to park AWAY from the building. The branch is open for business and we must leave the parking lot nearest the building open for customers.

To kick off the new meeting place, we're having an auction. The emphasis is on ST hardware and software, but as usual we'll sell anything.

See you there!

GENESEE ATARI GROUP

Serving the Flint area

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Inc.

GAG meets on the second Wednesday of the month at the Neithercut school, located at 2818 Crestbrook Drive, Flint. (Off Atherton between Hammerberg and Van Slyke). Meetings begin at 6:30 pm. All are welcome. GAG is a participating member of the Atari Interface Magazine, and members can purchase subscriptions at a greatly reduced rate. GAG is also affiliated with the Great Lakes Atari Digest, and members receive a free subscription with their membership. Membership is $15 per year for the family.

GAG has an exceptional public domain library of 8- and 16-bit software. Contact one of the officers to receive a complete catalog. GAG also has a large magazine library for use by it's members, including Antic, Analog, ST-Log, Start, and several others. We do not support piracy, Piracy is theft!

For more information contact:

The Genesee Atari Group PO Box E Flint, MI 48507

Presidents Report by Jerry Cross

Got a few important reminders this month, so read carefully! First, unless you have already sent in your subscription, this will be your last issue of AIM. Since our club can not afford to send out two seperate magazines, we began offering AIM at a discounted rate of $10. This subscription will begin in July, so unless I receive your check by June 15, you will no longer receive AIM. AIM is still an excellent magazine and you should consider this offer.

June is also the last meeting date for this summer. Neithercut school is closed from July to August so our next meeting will not be held until September 13. If there is any interest from the members, it could be possible to put on a picnic or some sort of other activity, but judging from the past years, these summer meetings were poorly attended.

At the last meeting I showed a video tape of the Disneyland World of Atari show, courtesy of John Nagy (CHAOS). If you would like to borrow this tape, which includes the entire seminar featureing Sig Hartman discussing the future of Atari, and other scenes of the show, let me know and I'll make arrangements to loan you a copy. I also have a copy of the Computer Chronicals PBS show that featued Atari. The June meeting will feature a demo of a new ST game "Battle Chess". This is a great animated chess game that I have also seen on an IBM computer. The demo is courtesy of Lew from Discount Computers.

GAG had a booth at the MACE show in May, and managed to earn about $600 in disk and magazine sales. This money will be used to cover our bills for next year. Over the past two years we have used profits from computer shows to get magazine subscriptions (with disks) from several computer magazines, an 8bit computer and drive for use by Discount Computers to demo and copy our p/d disks, software for our commercial library, and new disk drives for our librarians. Thank you for supporting our 8bit and ST libraries so we could afford all of this!

DON'T FORGET!!! The Detroit World of Atari show is only days away! We will need volunteers for both OUR booth plus helping out ST-World with the show. If you haven't done so already, and you don't mind giving up some time, please offer to volunteer! We also are in need of loaner computer equipment for the vendors who are attending the show. That's it for this month. I hope you all enjoy your summer vacation. See you in September!

GKAUG ATARI

GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets on the second Saturday of each month at 11 a.m. in the Dewing Hall, Room 305, on the Kalamazoo College Campus, corner of Academy and Monroe. Dues are $25/yr and include a subscription to Atari Interface Magazine.

President	Frank Fellheimer	657-6106
Vice President	Dan Youngs	
Treasurer	Dave Bryant	
Archiver	Dave Oldenburg	
SysOp	Alex Stevens	
GKAUG BBS		(616) 657-2665

Next meeting: Saturday, 09 Sep 89. We are not scheduling meetings for June/July/Aug this year. Your AIM will come in the mail as usual...if your dues are paid, of course.

We had about a dozen people at the meeting this May. Two of them were ST users, and got to listen to all of our 8-byte chatter.

We had a lot to show this time since Bryant, Oldenburg and myself attended the Atari Show in Detroit a couple of weeks ago. It was simply amazing. There was tons of hardware and software for the ST. I had no idea that there was so much. There was a lot for us 8 byte users as well. I bought the Sparta X cartridge and am learning how to use it. Its pretty nifty so far. I also managed to pick up an Atari Light gun and the Cross Bow cartridge to use it with....its really neat too. I bought it for my sister Celina in Chicago, but I couldn't help testing it out a bit. We also picked up a couple of programs for the club "Solar Star" and "Drop Zone". Only $2.00 each... What a deal.

We did a demo of the SpartaX cartridge, the Atari light gun, Cross bow, Cheat and showed how cheat worked on Shamus Case II... I finally made it to the Shadows Den...what a deal!

I am about to complete my tour of duty here in Kalamazoo and my work will take me out of the area. If the club is to continue, we need someone to take over the Helm of this ship. Please consider the Presidency of this club. It is most rewarding, and not really very difficult.

Our next meeting will be at Dewing hall in September, hopefully I will get things started if someone doesn't take over before then. We have an alternate location for the meetings in the wings also: Mr. Bill Cekola of Star World at 6151 S. Westnedge in Kalamazoo has offered to let us use some space in his arcade/pizza parlor to hold our meetings. It sounds like fun to me. Start the meeting, order your pizza, eat after the meeting, then play some real arcade games. Something new!!

I hope to keep you informed for the next few months, so check your AIM. Call me if you want to consider a new position of leadership.

Frank

Great Lakes Atari ST Support — 'GLASS', Michigans only 'ST' only Users Group — I ♥ my ST!

Meetings - First Thrusday every month, 6 p.m. to 9:30 p.m., Athens High School, 4333 John R, Troy, Mi., 1/10 north of Wattles <17 Mile> - Room 1528 - Mailing Address - P.O. Box 99737, Troy, Mi. 48098 Phone - (313) 828-1653 after 4 p.m. - Steve Mileski, president

Dues - $1.00 per month, ie:join in April - pay $9.00, all memberships expire on January 1, each year. Non-members welcome at no charge.

GRASS

GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

Gerry Borysiak	Director	(616)896-9358
Charlene Bird	Director	(616)795-3593

President's Monthly:16 may 1989.

With the winter computing season coming to an end, and hardcore 8bit users gearing up for the long hot summer nights, I find myself faced with the task of converting my disk library over to double sided format thanks to the addition of an atari XF551 disk drive. I have had it only a week and a half now (I got it at the Atari Expo) but it is one of those things you wonder how you ever did without it.

I have not worked at all with the DOS XE that came with it, I started to use SpartaDos from the start, and the two work very well together and I love to see those 1300-1400 free double density sectors when I format a new disk. Only two complaints with the drive, no power light to indicate if it is on, and the switch is in the back, (what do you mean I have to stand up to reach over and turn this thing on). To any thinking about a drive purchase, I recommend the purchase of one of these.

There are still some US Doublers left as of today. If you have a 1050 drive and have not bought yours yet, come to the June meeting to get yours.

The basic programming is underway again. The project is a disk cataloging system that will work with any dos, any drive setup, and be able to list directories and sub-directories. To this point I see only a problem with those who use DOS XE. The incompatability with other dos types might make this a tough challenge.

Meetings will continue through this summer, but July and August will be informal meetings and have been declared show and tell. If you have something of interest, bring it to one of those meetings and we'll have a system set up for you to show it. Those of you who have written something of your own now have a captive audiance to display it to. Let's all bring something to show and tell.

Lastly, I would like to commend those who put on that great Atari Expo. The displays and bargains were worthy of a show far larger than this. If there were any complaints, it would have been that the user groups could have used a little more room. Great work all, I hope this becomes the Atari world of the future. I look forward now to the June show (but Dear, I really did need this and I got a great deal).

See you at the meeting!

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)
MACE East	(313)978-1685	(3/1200)
The College Board	(313)478-9647	(3/12/2400)
DownRiver Outpost	(313)675-4660	(3/12/2400)
Molin's Den	(313)420-0407	(3/1200)

The May meeting of MACE was called to order by President Bill Rayl at 8pm. Bill announced this meeting was a celebration of Eight years of service to Atari users around the world. Bill also announced that special prices on disks would be in effect for this meeting only, and that ST Librarian Ed Hanson had a stack of labels (for 3.5") disks to sell at a very good price.

Pattie Rayl spent about 20 minutes discussing the MACExpo which was held last weekend. Pattie treated us to a slide show of the event, pointing out faces to the names we've all come to know over the past few years. Pattie thanked all the people who had helped make the show such a success and, in return, received a lively round of applause for her efforts.

Bill presented member Don Neff with this year's MACE Ace Award. Don's efforts to support the club during his 3 years of membership have been greatly appreciated! (Don got himself elected as 8Bit Disk Librarian during his first year of membership and, after exemplary service there, he found himself elected to the presidency in the following year. Don was also actively involved in the MACExpo by taking on the task of scheduling and orchestrating the stream of seminars that were held virtually non-stop throughout the entire show.)

"Intermission" lasted the remainder of the evening as members enjoyed cake and homemade punch (thanks Heather!) while door prizes were distributed. Ironically, both Ted Newkumet (8Bit Disk Librarian) AND Ed Hanson (ST Disk Librarian) won a box of blank disks! Prizes were donated by:

Rite Way
Atari Corporation
Sideline Software
CodeHead
ICD
Alpha Systems
Michtron
SoftTrek
Gribnif.

The next general meeting of MACE will be held on June 20. The topic for our June meeting will be New Users, so if you are new to your ST or 8bit (or still feeling hesitant about using it) please join us!

TINKER ACE OF OKLAHOMA

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at PO Box 7697, Moore, OK 73153 or at the TACE BBS (405) 793-7980, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Corrrespondence - $15.00.

President	Michael Beard	(405) 793-7978
Vice President	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Greg Yelle	(405) 390-9184
BBS SysOp	Michael Beard	(405) 793-7978
Technical Advisor	Ron Hamilton	(405) 387-5649

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the second Saturday of every month at 2 p.m. at the Rudy Zauel Memorial Library on the corner of Shattuck and Center in Saginaw. Upcoming meetings are scheduled as follows: May 13, and June 17, 1989.

LeRoy Valley	President	686-6796
Marty Schmidt	Treasurer/Secretary	792-6029
Al Jennings	ST Disk Librarian	790-1980
Ted Beauchamp	8bit Librarian	686-8872

Club dues are $20.00 per year. For this fee you get the Atari Interface Magazine, support for both the 8bits and ST's, and full access to the clubs public domain library. We currently have 150 8bit disks and 50 ST disks. 8bit disks cost $1 each, and ST disks cost $2 each. Check your mailing label. If you need to renew or you haven't even joined yet, then do it now!

Note from the Prez

We didn't have any eightbitters show up this month...I really don't why. And I guess I'll never know unless somebody tells me! We've finally got a real Atari store opening up in our area! Midi-To-Go (run by Charlie Brown...No kidding!) on Euclid Avenue in Bay City will be carrying a full line of Atari ST hardware and software! Hopefully this will help us increase our membership! If you can, please patronize Charlie's establishment.

STill to Come!

Want to see a decent drawing package? I don't mean an ART package, I mean a DRAWING package! Well then, come to the June meeting and see Brian LaFreniere demo EZ-Draw on the ST! Along with the basic EZ-Draw package Brian will also demo some of the accessories that Migraph sells for EZ-Draw (SuperCharger, EZ-Tools, etc.). Brian has been using the package for some time, so this should be an excellent demo! Along with EZ-Draw, we'll also be showing a Hewlett Packard DeskJet and the Migraph GDOS printer driver for said DeskJet.

RelicST to Relish!

Tom Wheeler really did a stand up job demoing GST-C! No kidding! He explained all of the pros and cons of this program (which E. Arthur Brown is currently selling for the incredibly low price of $14.95), and even showed some sample programs that he "threw" together. GST-C is a complete beginners C package. It includes the compiler, assembler, and an excellent editor. The editor alone is worth the price! The only real bad points to this program are the sketchy documentation and the lack of floating point support. If you want to try C, however, this package can't be beat! After the demo, we raffled off the package and our newest club member, Wayne Fenior, won it! Congratulations Wayne!

Official TAG elections are always held in June (or July...), so get ready to vote! It looks like Steve Volker is willing to run for President, so that means LeRoy will try for ST Disk Librarian. Please show up and volunteer if you have something to contribute!

Eight Bit Meeting Notes By Ted Beauchamp

Due to a missed deadline the following article is the minutes of the meeting for April.

The Eight Bit portion of the meeting was spent looking at several disk from the club public domain library. Since we have some new members and maybe some members that haven't been around in a while we thought it might be fun to pick a few disk with interesting titles and see what they were. We looked at a Wheel of Fortune program and several programs for children. We may continue to do this if everybody seems interested since we have so many disks in the library that we are not familiar with. We also received approximately eighty disk of programs from Mike Ranger. He has donated these disks to the club library. I will attempt to sort through these and include them in the club catalog as soon as possible. If anyone would like to volunteer, your help would be welcome. With this many new disks it sure would speed things up. We may already have some of these programs in the club library since Mike used to belong to a different Atari club that also belonged to AIM (sorry I don't remember which club, no offense intended) and probably traded disks with the same sources TAG did. I now have some more copies of the library catalog. If you need a copy come to the next meeting or give me a call and I'll tell you how to pick one up. Mike also donated twenty or thirty disk full of text files and other stuff that could be formatted and reused. I don't think it would be right to charge the usual price for a copy of a club disk made on one of these used disk, so I would like to suggest we either remove the fee for copies using these disks or simply offer these disk to the club members at a minimal fee for their own use. The disks would have to be sold on a first come first served basis, with a maximum of five disks per member per month. It appears that most or all of the regular eight bit members could not make the May meeting. We therefore have no meeting notes for this month. I'm sorry if any eightbit members showed up and I wasn't there to give you access to the club library. If any members have questions or need copies of club disk call me at the number listed at the beginning of the club notes. We should be back on track for next month though so show up and enjoy our newest disk of the month. Remember, until the supply of previously owned disks is used up the price will be reduced.

Equipment volunteers for June:
ST Brian LaFreniere Monitor & 1040
LeRoy Valley HP DeskJet
8 Bit Ted Beauchamp Computer and disk drive
Hank Kaufmann Monitor

Remember, if you're bringing equipment, please bring all of the necessary cables (such as power cords, monitor cords, mouses, etc.).

The May meeting of the Washtenaw Atari Users Group was called to order at 7:59pm on Tuesday, 5/9/89, by President Jon Brode. The meeting was held at its new location inside the Michigan Union building on the campus of the University of Michigan. It would appear that many members did not remember the move was announced at the April meeting as the turnout was light. Several new faces appeared during the course of the evening, presumably as a result of WAUG's appearance at the MACExpo the previous weekend.

Jon briefly discussed the potential interest in WAUG's involvement with the MacTechniques Macintosh users group as was presented by that club's president, John Shuler, in the April general meeting. While the members are still interested in hearing more, there has been no response to any attempts to contact the club via their BBS, as suggested by Shuler. It would seem a good idea is headed into oblivion.

Both disk librarians (Mike Millage and Russ Crum) discussed results of disk sales at the MACExpo, and both also announced that there would be no Disk-of-the-Month as they simply had not had time to make up any bundles after all the work they had done to get things ready for the show.

Treasurer Dick Selke announced that the club had purchased a used SF354 disk drive to replace the brain-dead unit that has been causing Russ so many headaches. Dick recapped total sales income and expenses incurred at the show, and followed with a to-date report of the club's financial status.

Jon led a short Q&A session, which was followed by demonstrations, done by Craig Harvey, of a Morse Code tutor and a demo release of "Quiz Plus" from Mad Scientist Software. Mike Millage then showed "The CPR Disk" from the XL/XE library and noted that he would have extra copies at the May general meeting.

Member Jay Skotcher related an interesting tale of frustration about having had a Future Systems GTS-100 disk drive that "forced the write protection ON" in his internal drive A: whenever it was plugged into his ST! Jay noted that Future Systems did resolve the problem.

The June general meeting, to be held on 6/13, will again be held in the Michigan Union and the feature topic will be Officer Elections and a Swap Night.

Michael Olin, WAUG Rec. Sec'y

Enhance your publishing power.

Migraph Hand Scanner.

Add scanned graphics to all your projects quickly and easily with the Migraph Hand Scanner.

The Hand Scanner provides a scanning window over 4″ wide with four scanning resolutions: 100, 200, and true 300 and 400 dots per inch. It also offers adjustable contrast, three dither settings for scanning halftones, and a special setting for line art.

Build your own library of images. Logos, photographs, books, illustrations . . . provide you with an unlimited supply of art.

Touch-Up,™ Migraph's high resolution image editor, lets you scan *and* edit your images. Powerful editing tools include crop, invert, resize, flip, cut and paste, multiple zoom levels, a full array of paint tools, and much more.

When your images are "pixel perfect", import them into your favorite ST publishing programs like Calamus, Fleet Street, PageStream, and Publisher ST. In addition, several save formats let you use your images on the PC and Mac.

The Migraph Hand Scanner and Touch-Up. Powerful tools for professional publishing.

For all Atari ST and Mega systems with monochrome or color monitors, 1MB memory and 3.5″ DS disk drive.

See your dealer today for more details or call us direct. Dealer inquiries invited.

Editorial Ramblings

Well, the Dearborn World of Atari (WOA) show has come and gone. Overall, the show was a fair AtariFest, but well below the expectations of many show attendees, exhibitors and probably even of ST World.

Previous press releases and announcements online on GEnie and in the online magazines claimed that Atari would be there in force, with 10 to 15 representatives. In fact, only a handful of Atari people were there.

A number of the most important exhibitors that were scheduled to appear didn't show, including Avant Garde, Timeworks and Antic/STart.

Previous to the show, it had been reported that the Dearborn WOA show was going to be bigger and better than the Anaheim show that took place in April. The projected attendance was around 6,000 for the Dearborn show. Unfortunately, the show fell short on both of these. The official attendance according to ST World is 3,100, while other sources have placed the figure at closer to between 1,500 and 2,000.

The near total lack of advertising in Detroit and surrounding areas is probably the singlemost important contributor to the low turnout. With only two weeks to the show, a local club officer involved in the show discovered that nothing at all had been sent to area user groups to promote the show. He took it upon himself to send flyers to the clubs, but it was probably just too little, too late.

The seminar schedule for the show was, in a word, dismal (not that the seminars that were scheduled weren't good ones). With only seven seminars on Saturday (one of which was cancelled because Tom Harker of ICD didn't come to the show) and three scheduled on Sunday, there wasn't much to chose from. And, to make matters worse, four seminars on Saturday and two on Sunday were scheduled at the SAME TIME, causing showgoers to choose between them.

Comparing this professionally produced show to the many user group sponsored shows, the Dearborn WOA show was a definite letdown. The August 1987 Detroit Magic show sponsored by MAGIC, GLASS and GAG and the AtariFest produced by the Toronto Atari Federation in November 1988 were far more enjoyable.

The show was definitely not a total failure, and a number of the exhibitors were showing some very interesting products. We will have a full report on the show, with photos, in the next issue of Atari Interface Magazine.

From the Reader's Viewpoint

Dear Fellow 8bit Atari Users,

We are trying to accumulate information on several subjects. We are trying to get hard facts and not rumors or speculation. We would appreciate it if you would communicate with us on any or all of the following subjects giving as much factual information as you can. Anything we find out will be made available to all who cooperate with this effort.

First Subject: XEP80

With the large number of public domain programs such as Speed Script or Text Pro and the several individuals who understand and program with Machine Language, has anyone adapted any applications to 80 column? Most XEP80 users have the relocated handler which allows them to use the excellent BasicXE program language. Has anyone figured out how to use the alledged features of XEP80 like Double High, Double Wide, and Underline? Has anyone figured out a way to display Print Shop icons in 80 column?

Second Subject: Memory Upgrades

Many of us have Newell or Rambo 256K upgrades in our 800XLs. How much larger can we go and, most importantly, how? Information on how to perform upgrades on other 8bits is also welcome.

Third Subject: Hardware Improvements

With IBMs, all a person has to do is plug in a board to have speech to use in their programs. With Atari, we have only a couple of after-market speech devices. When calling these manufactureres, we find that they make the products but that the people who designed them have moved on. Does anyone know of a hardware speech device which recognizes Atascii or Ascii (not numerical code) and works with a handler (or at least uses a handler that doesn't conflict with the XEP80's)?

Does anyone have any plans to hardwire the CX85 Keypad? How about a handler that doesn't conflict with the XEP80? What about any other useful devices?

Fourth Subject: Modifications to the OS

There are several members of the local Atari club who have done modifications to the OS. The modifications performed include providing a cold start and redefining the arrow keys to work without the control key. We would like to know about reversing the Option key and using the Help key in place of Control-1. Any other things that programmers have found useful would be greatly appreciated.

Fifth Subject: Parallel Buses

We are wondering if anyone has experimented with the Parallel Bus for attaching custom designed hardware pieces or reattaching current hardware. We are considering the possibility of designing a type of CPU box containing expanded memory, speech device, modem, drives, XEP80, etc., all addressed through the Bus.

Sincerely yours,
Ron Hoffman
FACCS
W. 2712 Wabash
Spokane, WA 99205

Ron, we've printed your letter in the hope that some of our local 8bit hardware gurus will either contact you directly or write up an article or two detailing some of the projects you're interested in and submit it to AIM. So, what do you 8bit hardware hackers have to help Ron out?

Atari News and Comment

by Bill and Pattie Rayl

At Atari Corporation

There have been several noteworthy events in the last month at Atari Corp. Atari executives have hired Chris Roberts, former officer of a Pasadena user group, to be the User Group Coordinator and official show presence for Atari.

Roberts seems enthusiastic towards his job and Atari when we spoke to him at the World of Atari Dearborn Show, but his style of approach left a sour taste in at least one developer's mouth.

Summer CES

Atari was also busy at the recent Summer Consumer Electronics Show at the McCormick Place in Chicago, IL. Atari had the usual display of 8bit game systems and the older 2600/7800 line, plus a small ST demonstration area.

The main focus of CES for Atari was the introduction of their hand-held game system, called the PCES or Personal Color Entertainment System, to compete directly with the Gameboy from Nintendo. The retail price for the Atari system is proposed at $150 while the Nintendo is suggested at close to $80. See the article covering CES later in this issue.

On the American Stock Exchange, Atari stock has been steadily climbing for the past month, hitting a high of $9 per share near the end of June. That's quite a comeback from the near $4 per share of just a few months ago.

Software from Atari

New software from Atari was on display at the World of Atari Show recently, but only one of the two packages were for sale contrary to statements prior to the show.

The new software was an 8bit version of MIDI Maze and Word Flair, an integrated spreadsheet, word processor and database program for the ST. MIDI Maze was for sale, but no information was available on price, availability or release date on Word Flair. AtariWriter 80 was also running at the Atari booth, with complete packaging and documentation.

Atari Release Dates

This is also the end of the second quarter of 1989, and we haven't seen the hardware that, in December of last year, Atari promised would hit the market in the first or second quarter of 1989.

In a CompuServe conference late last year, Sam Tramiel said the Stacey would be on dealers' shelves worldwide by this time of year. He also indicated the ST Game System, designed to compete with Sega's Genesis, and Atari's TT should also be available by the second quarter's end.

OnLine News

Formal conferences on the three major online services have been noteworthy as well. Spectrum Holobyte's President Gillman Louie made the conference circuit this month with stops at GEnie, Delphi and CompuServe. The CodeHeads, otherwise known as Charles F. Johnson and John Eidsvoog, also appeared in formal conferences on Delphi and GEnie.

Other online news came from PC Pursuit this month. June 30th marks the end of the flat rate charge PC Pursuit/Telenet built their reputation and popularity on. Now, PC Pursuit is charging $30 per month for ONLY 30 hours of time, including time you may be receiving a busy signal from their ports. If you go over the 30 hour limit, you will be charged a $3 per hour fee. There is a family rate of $50 for 60 hours usage. You are still charged the $3 per hour fee for any hours above the 60 limit.

More Atari Casualities

At least one Atari developer and several Atari dealers have gone out of business in the past month. Astra Systems was based in Santa Ana, California and was well known for making heavy-duty hard drives. Lou Schwing was famous at Atari shows for holding one of his drives a foot or so above the table and dropping the drive in the midst of loading picture files. Lou may not drop out of the Atari scene because he is reported to be talking to Avant Garde about being their West Coast distributor.

Computer Cache in Massachussetts and Springfield Home Computer in Ohio are two dealerships who also recently closed their doors. They join a growing list of Atari supporting dealers that have called it quits, like United Computer in Michigan, Applied Computer Associates in Virginia and CompuClub in Massachussetts. No information was available at this time to explain why either store closed, but other stores have sited Atari's lack of communication and support to dealers as well as lack of Atari stock to sell as major contributing factors.

Diamond Update

On the software front, Reeve Software, recently split from a marketing arrangement with USA Media, is selling the Diamond GOS cartridge and a number of windowing applications packages.

Diamond Paint, a powerful paint program that allows use of various fonts, importing of pictures of various formats (including Atari ST D.E.G.A.S. pictures), and easy drawing of lines, circles, boxes, etc.

Diamond Write, a word processor with spelling dictionary, boasts such features as 80 column output WITHOUT the need for any hardware enhancements, XEP80 support for even better quality display, multiple fonts and text styles.

The Diamond Publish object oriented desktop publishing package allows for creation of multiple page documents containing text and graphics.

All these applications use the windows, pulldown menus and other graphic operating features similar to those found on the Atari ST. List price for each of these packages is $29.95. Diamond GOS Disk version ($29.95) or cartridge ($79.95) required. Versions of these programs for the Diamond Cartridge have additional features not available in the versions for the disk-based Diamond GOS. Contact Reeve Software, 29W150 Old Farm Lane, Warrenville, IL 60555, (312) 393-2317 for more details.

Other New Software

Antic Software/Terrific Software, a surprising no-show at the Dearborn World of Atari show, has recently announced the availability of the STOS Compiler for the Atari ST. A much requested companion to the popular STOS Basic package designed for writing games, the compiler converts Basic commands at a rate of more than 500 instructions per second. Finally, STOS programmers can bring their programs to the general public. The STOS Compiler is attractively priced at only $34.95.

Also from Antic Software comes Cyber Print and the Interiors Design Disk, the two newest additions to the Cyber family of CAD products. Cyber Print allows you to use your ST and an inexpensive Okimate 20 printer to produce "the best full color printing combination available for under $5,000," according to Charles Cherry, Antic Software Product Manager. Cyber Print retails for $49.95. The Interiors Design Disk is a library of furniture and appliances, including complete models, component parts, detailed blueprints and tips on interior designing. List price is $34.95. For more information, contact Antic Software, 544 Second Street, San Francisco, CA 94107, (415) 957-0886.

For those ST owners who are always too busy playing with their machines to remember birthdays and other holidays, Blue Turtle Software has released Today/ST. Today/ST features a 5,000+ database of famous events and important dates and allows the user to add his/her own items to the list. When booting up the computer, the program automatically displays any urgently important dates, accompanied by a beep, followed by any other "trivial" information available concerning that day. The software comes with an editor for adding, deleting or modifying items in the database and the package retails for only $14.95 U.S. and $19.95 Canadian. Contact Blue Turtle Software, c/o Peter Ritchie, 55 Jackson Ct., Kanata, Ontario, Canada K2K 1B6, (613) 592-0203.

Alpha Systems of Macedonia, Ohio, has introduced two new and innovative products to the ST market. A new software package called Back Trak allows double-sided drive owners to gain access to the back side of commercial and even copy protected single-sided disks. This allows use of the back side of single-sided game disks for saved games or even for compiler two-disk sets onto one disk. The program is compatible with available copy programs, such as ProCopy, ST Copy and Copy II ST, allowing two copy protected games to be placed on opposites sides of the disk. Back Trak allows for booting of programs from EITHER side of the disk, and even allows booting your system from drive A or B. With no cables or connectors to get in your way, just 100% software, Back Trak is a breeze to use. All this for only $29.95!

For the MIDI enthusiasts, Alpha Systems releases Jam Master, a program that turns an inexpensive MIDI keyboard into a full-featured digital sampling synthesizer. Having seen this package at work, we were very impressed. Jam Master turned a low-end Casio into the equivalent of a high end Roland right before our eyes. Jam Master allows full keyboard mapping, letting you assign up to 32 different digitized sounds to your keyboard, a real-time tune-up features, four voice polyphonic sound, and sampling rates up to 40,000 times per second. The program requires a MIDI compatible keyboard and cartridge-based sound digitizer. The program comes with 50 pre-sampled digitized sounds. For more information, contact Alpha Systems, 1012 Skyland Drive, Macedonia, OH 44056, (216) 467-5665.

If you're an ST owner that has been looking for a relatively inexpensive way to back up the precious data on your hard drive (and you have a VCR), Seymor/Radix has just the product you need. DVT is a hardware VCR hard drive backup system for only $249.95. The hardware plugs into the ST's cartridge port and uses standard RCA cables to connect to the VCR, allowing you to store up to 360 megabytes onto a standard VCR tape at the rate of 8 megabits per minute. Contact Seymor/Radix Inc., P.O. Box 166055, Irving, TX 75016, (214) 823-5797.

And, last but not least, the CodeHeads have done it again with CodeHead Utilities. This package of useful desk accessories and programs include such things as a multi-featured, GEM-based file handling and manipulation program; an organizer of files in your AUTO folder; configurable ramdisk that does not do a double reset on bootup; a graphics viewer/slideshow program with some very nice features; a program that allows replacement of the system font with customized fonts and the ability to print these fonts to Epson compatible printers; a user configurable print spooler that even puts Alt-Help screen dumps into the print buffer; and much, much more! All this for only $29.95. For more information, contact CodeHead Software, P.O. Box 74090, Los Angeles, CA 90004, (213) 386-5765.

Turbo-Info # 1

An Introduction to the Turbo-816

by Chuck Steinman (DataQue)

Welcome to the introductory article in a series which will present the Turbo-816 from DataQue Software.

Initially, the features of the product will be presented, and later the series will progress to actual applications and programming hints. If you have any comments or critisizms, I would appreciate it greatly if you would write a note to the editor of this fine magazine and express your thoughts.

For those of you not familiar with the Turbo-816, it is a hardware and firmware upgrade for the Atari XL and XE computers that expands the capability of those machines, while still maintaining compatibility with your existing software and hardware investment. There will also be a version for the original 800, although no release date has been set at this time. The XL/XE kit is called the Turbo-816x, and will sell for $120 plus $4.00 S&H within the US. Foreign destinations, COD and other special handling would be extra.

The main component of the T816 (short for Turbo-816) is the CPU adapter board. For those of you unfamiliar with computer jargon, CPU stands for Central Processing Unit, which is the main "brain" of your computer. The CPU that came in your XL/XE computer is an 8bit 6502. The actual CPU in the Atari XL/XE computers is a slightly modified version of the 6502.

The T816 adapter board, along with a short ribbon cable, replaces your existing 6502 CPU with a new, more powerful 16bit CPU. This new CPU has the unique capability of also being able to understand the 8bit 6502 CPU instructions. That allows the adapter board to still execute your original 8bit programs.

The CPU adapter board is approximately 5 inches by 2-1/2 inches, and it takes care of all timing and control functions, allowing it to fully emulate (or function like) the special Atari version of the 6502 while also extending the addressing range. One jumper must be added to your Atari XL/XE motherboard to make the system work. Installation and modification information is provided as part of the Turbo-816 kit.

The other component of the Turbo-816 system is the Turbo-OS ROM. This part is a 28-pin integrated chip that holds the initialization and control software that most users take for granted. Originally, I had planned on this chip fully replacing the Atari OS and just adding any new functions required by the new CPU to allow it to work properly.

It wasn't long before I ran into a snag. Atari would not release the source code for the XL/XE Operating System ROM to me. I offered to sign any non-disclosures and pay any required fees, but the best offer they could come up with was $1000 up front, and 50 cents per unit sold, for the right to copy only certain sections of the Atari Operating System ROM, but no source code was to be included in that agreement.

I was not impressed with their support, so I proceeded to write the entire Turbo-OS from scratch. This not only cost several additional months of programming effort, but also increased the amount of time to test each and every function. The resulting Operating System is 100% compatible with software that uses the published, legal entry points into the Atari OS and legal RAM locations. Because of many programs making illegal calls to the OS or using reserved RAM, I suggest that BOTH the Atari OS and the Turbo-OS be installed in your machine and a toggle switch be used to select which is active. Details on how to make this modification are also included in the kit.

A popular misconception about the upgrade is that it will execute ST and/or IBM/PC programs. It will not.

I have never advertised or claimed it would, so I can only guess someone that was not familiar with assembly code, or the internal workings of computers, started this rumor.

The ST uses a 68000 processor, and the IBM uses an 80x86-based processor. The 65816 is not software compatible with either of those CPUs, and neither of those CPUs can directly understand 6502 code. If someone wants to write such an emulator for either of those CPUs, let me know when you have it done!

The Turbo-816 uses the WD65C816P5 CPU, which was designed by Western Design Center and is manufactured by California Microsystems. This is the same CPU used in the Apple *//*gs. Anyone familiar with the *//*gs knows it is a powerful little machine, although it does have a few design problems that prevent it from being able to fully take advantage of the CPU.

Many Atari owners have asked me, "What will this do for me?" There are many ways to answer that question depending on what you use your computer for and whether you program. The Turbo-816 not only adds 16bit working registers, but also new, more powerful instructions and a 24bit address bus. Now with these new capabilities, more powerful new programs can be written to allow the Atari computers to compete again with the more expensive 16bit computers. The new addressing capability allows for up to 16 megabyte of memory (RAM), and the new instructions make smaller, faster, and more complex routines possible.

I have made MAC/65 Macros and other information available to all registered owners via my BBS and the GEnie telecommunications service, allowing owners of MAC/65, or any other macro assembler, to begin using the new 65816 instructions immediately.

To the non-programmer, at this time there are no programs which take full advantage of the Turbo-816. Current applications will run from 5% to over 300% faster depending on how much they use the Turbo-OS. Since existing software was not written to access the new memory or take advantage of the new instructions, that software can only gain performance by calls to the Turbo-OS.

I will have several new applications which will take advantage of the new memory and power, though. The first of these will be a spreadsheet program called the Turbo-S16. It will be similar to VisiCalc and SynCalc. The program will determine if a Turbo-816 and Turbo-OS are available, and then use any expanded or explicit memory, if available. Otherwise, it will run on a stock Atari 400/800/XL/XE using the normal RAM. Since it is not initially going to be designed as a concurrent application (i.e., it will not multi-task), the program will absorb all available RAM for its use.

That means, if there is one megabyte of explicit or expanded memory available, the program will allow you to use up to that amount for the application. I plan on releasing this program in ROM, which will be, to my knowledge, the first spreadsheet program to be implemented in ROM for the Atari. A discount will be available (with proof of purchase) to owners of SynCalc, SynCalc+ and VisiCalc as an incentive to upgrade to the Turbo-S16. Details will be released later.

Another application nearing completion is the Turbo-A16. This is an assembler that will allow you to assemble native mode 65816 code. I am trying to incorporate enough versatility to allow loading of source code from popular file formats. That will allow people to use their existing libraries without first having to convert them. It has not been decided whether this application will be in ROM or disk based.

That's the basics of the Turbo-816. If you have any specific questions you would like answered, please forward them to the Editor of AIM, and I will see that you get an answer. For those of you with GEnie accounts, I have a special section dedicated for Turbo-816 questions and answers, so feel free to drop in!

Everything you need to know to be a Dungeon Master Champion

Summer CES 1989

by Jim Kennedy (MACE)

What do the following have in common? Chicago, IL; over 735,000 sq. ft.; 13 miles of isles; more than 70,000 visitors; and 1,400+ exhibitors. Why the 1989 Summer International Consumer Electronics Show (CES), of course!

This was my first chance to get to one, and I can say that I had a GREAT TIME! I was exhausted by the time I got home, but boy, what a way to spend a vacation!

The Consumer Electronics Show is held twice a year, in the winter (early January) in Las Vegas, NV, and again in the Summer (early June) in Chicago, IL. The show is designed for manufacturers to show their newest products and buyers to make the deals that will make the products available to the public.

At the show, everyone wears a color-coded name tag, which identifies you as one of the following classifications: Exhibitor, Buyer, Distributor, Manufacturer, Manufacturer's Rep., Advertising/Mktg./P.R., Financial Market Analyst, Editorial Press, Media Representative or Guest.

If you would like more information from an Exhibitor, you simply give them your name tag. It is similar to a credit card, in that it has raised print containing your name, company name, address and your classification. The Exhibitor runs your card through a device that puts an imprint on a request for information. It beats carrying around a couple hundred business cards, although you should have some of those just in case.

The Press was there in full force, as we kept seeing TV crews, and other members of the Press checking out the latest products to report to the public. This is the capacity in which I went, along with Tom Daugherty, who acted as the AIM Photographer.

The CES Press Room was a real help, as they had booklets to guide us from building to building and Press Kits (which are basically just News Releases, photo's, etc.) explaining the new products from each company. For instance, the Press Kit from Atari includes B&W photos of their new hand-held game machine, and even a set of eight color slides showing the games for it.

I was also surprised at the number of free magazines given away by each publishing company. I found the most recent issue of everything from "Electronic Gaming Monthly," "Omni," and "Video Magazine" to "Penthouse!"

There was more than a little terminology to pick up, such as "platform," which refers to the type of computer (ie. Atari ST, IBM) the software or hardware is being designed for. And when you ask, "When will it be out?" and they answer "3Q," you have to know that means the Third Quarter (July-September). The term "Affiliated Labels" (AL) refers to smaller companies contracting with larger ones (ie. Electronic Arts, MediaGenic) to distribute and market their products.

The show was held at McCormick Place East (Audio/Video), North (Atari, Nintendo, Sega) and McCormick Center Hotel (High-End Audio/Video). For those who didn't have enough to look at, there were various workshops and special events running throughout the show.

We spent two days just in McCormick North looking for Atari support, checking out the new Sega 16-bit "Genesis" game machine and the massive Nintendo booth. We didn't find any new Atari 8bit products, but that doesn't mean there aren't any. Not all software companies were there and Atari does have a few new games coming out for the XE Game System (XEGS) on cartridge.

There was a good amount of ST support though, with companies from the

7600
7500
7400
ATARI

United Kingdom (UK) and France (i.e., UBI and Titus) showing their interest. It seems a lot of titles are coming from Europe where the ST is popular.

Companies like Electronic Arts with affiliated labels based in the UK have several tried and proven winning titles coming to the U.S. market. This seemed to be the general consensus: if it works there, bring it here. A couple of American companies (Electronic Arts in-house and Infocom) are releasing little, if any, new software due to piracy. I was very surprised to find that Infocom has no further plans to bring out anything for the ST! I recall Infocom's catalog always brimming with versions for virtually every known computer. This is a real shame, as they have some of the best adventures available.

The Atari Corporation booth covered 2,500 sq. ft., and was located close to the Sega booth which had 9,900 sq. ft. and the giant Nintendo booth with over 50,000 sq. ft. (three football fields). About a quarter of Atari's booth contained five kiosks, each with a different game machine (ie. 2600, 7800, XEGS). Atari didn't announce or show a 16-bit game machine. With Nintendo's 80% share of the American video game market, they have a good reason to think twice. Atari seems to be trying to capitalize on the current surge in video game sales by bringing out new titles for their old game systems.

Atari has also started a "Hints and Tips" type magazine for them, called "Atarian Video Game Magazine," which is very similar to Nintendo's magazine "Nintendo Power." Atari's press release boasts of the magazine's circulation (110,000), as does Nintendo (1.2 million), but Nintendo had given theirs away free with their units until August of '88 when they renamed it and started charging for it. Both magazines are bi-monthly and both stat's are five months from their debut. Interestingly, the May/June, and August issues both claim to be PREMIER ISSUEs.

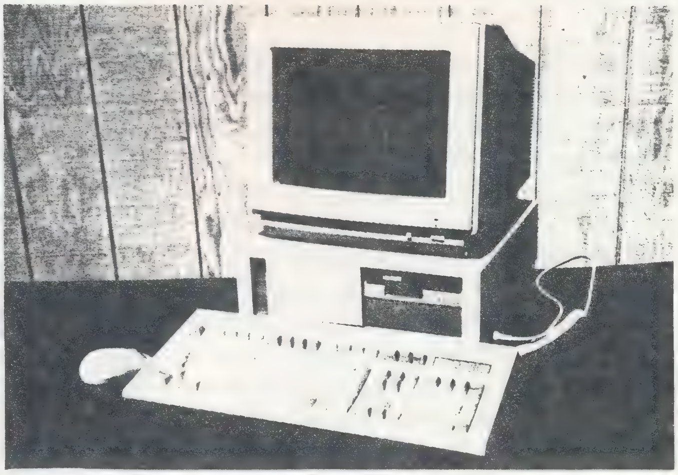
According to Atari, the XE Light Gun is compatible with the 2600 and 7800 video game systems and software will be coming out for them to support it. Those games include "Barnyard Blaster" and "Sentinel" for the 7800 and a version of "Sentinel" for the 2600, along with one called "Shooting Arcade."

Sixteen other non-gun games for the three game systems to be released by the end of '89 include "Midi Maze" for the XE and "Double Dragon" for both the 2600 & 7800. The Light Gun will retail for $24.95, while the 2600 games will be $10-$18, the 7800 games will sell for $18-$35 and the XE cartridges will cost $20-$35 each. Meanwhile, the "Atari Advantage" program running across the country is a way to collect free games and prizes.

Consumer Products (read calculators) took another chunk out of the booth. An entire line of calculators, small to business-type, and solar-powered, 19 models in all. For only having 19 models, Atari must have brought along a lot of extras for the amount of space they took up.

Moving on, we found only one 1040ST, hooked to two MIDI keyboards and demoed to those interested. Hardly enough display space for a product that has made them so much money in Europe.

ATARI COMPUTER
ABC 286/30
ATARI COMPUTER
ABC

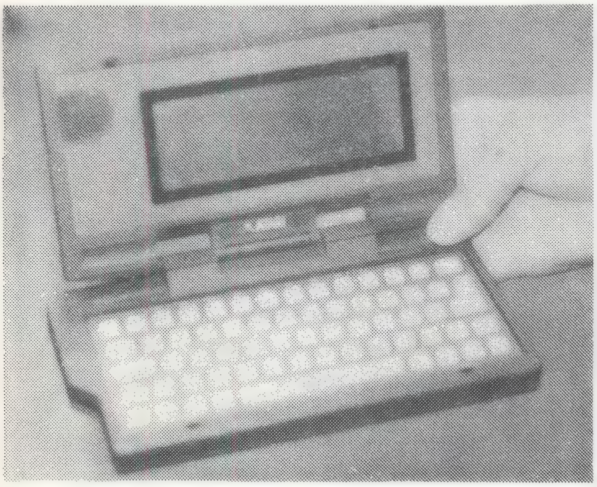


Next to the ST, and on the same desk, there were two identical "ABC 286/30" IBM/AT compatibles. Andy Marken, from Marken Communications, Inc. (Atari's 6-month old PR firm) said that this machine was designed for the U.S. market with its price/performance ratio. The 80386 (not shown) was designed for the European market and is doing well there. He also said that neither machine would cross markets, that is, you won't see the 80386 (PS/2 compatible) in the U.S. and visa versa.

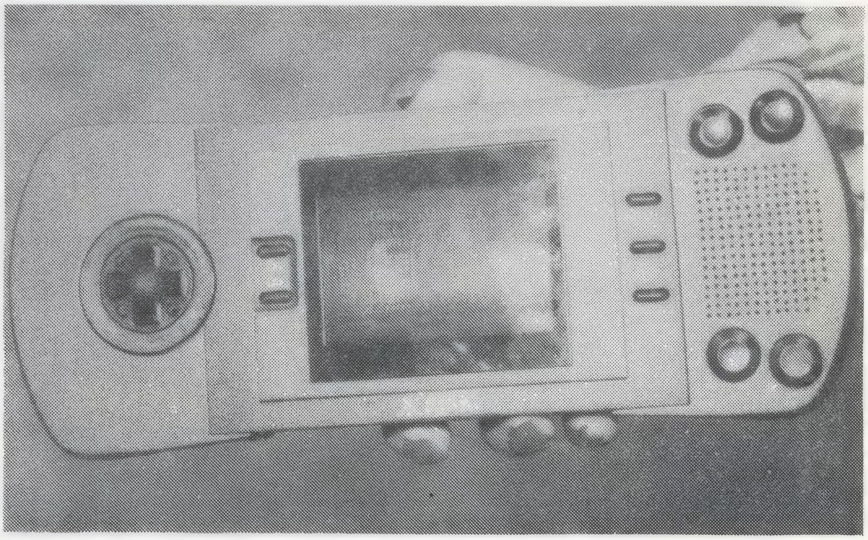
The 286/30 runs at 8 MHz, has 640K RAM, 30 Mb (RLL) hard drive, 3.5" 1.44 Mb disk drive (the one on display had a 720K drive), supports MDA, Hercules, CGA and EGA. One serial port, parallel port and three AT expansion slots are included, with memory expansion to 4 Mb possible. The machine uses the Intel 80286, 68 watt power supply, clock, MS-DOS 3.3, BIOS: AMI, with dimensions of 5.75H x 14W x 16D inches. Atari still holds to their "90-day officially announced, have it in the stores" policy...although on some products, quantities maybe limited, hmmm... They claim 3rd quarter on the ABC 286/30.

You're probably wondering if the "STacy" (portable ST) was there; well it wasn't. The prices on the "Stacy" were $1495, or $1995 with a 20 Mb hard drive. The delay was due to the FCC, but they claim it should be out in August. The "Portfolio" (IBM XT compatible) was at the show, although you did have to ask to see it. As an IBM XT user myself, I was SHOCKED at the small size — about that of a VHS video tape! I don't have a statistics sheet on it, so I can't give you much. It has a price of $399 and is supposed to be available by the time you read this.

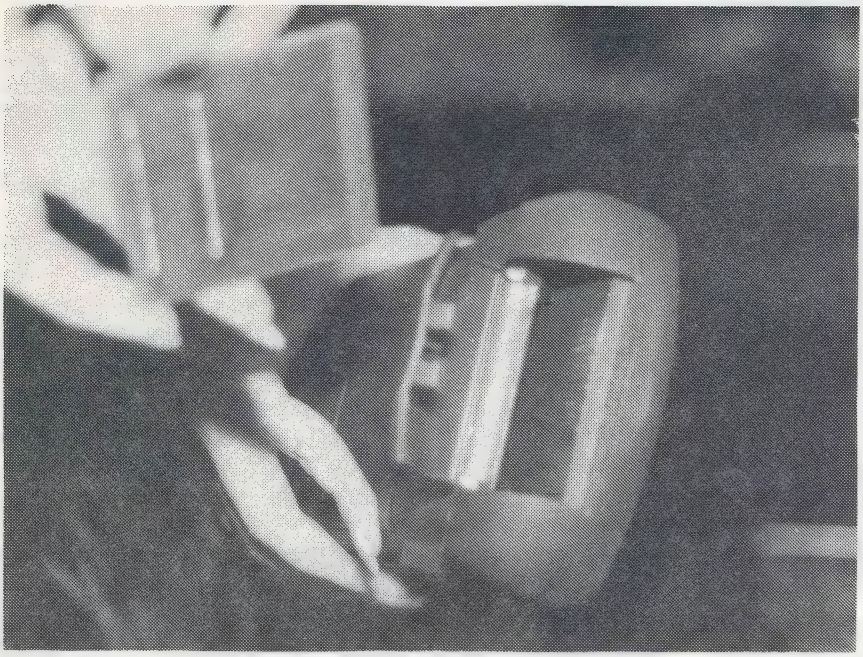
I like to keep the best till last...in a quarter of Atari's booth they were showing the "Atari Portable Color Entertainment System." I've come to learn that this was actually developed by Epyx (what arrangement there is between the two companies, we can only speculate). This unit is also the size of a video tape, with a 3.5" color LCD screen (160 x 102 pixels), with 16 colors out of a palette of 4,096. Its zips along at 16 MHz on only 6 "AA" batteries. It doesn't end there, the unit has 4 channel STEREO sound (headphones included), weighs one pound, has 64K, takes game cards that store up to 16 Mb., optional AC adapter, eight-way joypad, two fire buttons and five function



The Portfolio from Atari



The new Game System from Atari



Another view of the new Game System

buttons. Both right-handed and left-handed people can use it, and there is a Comm-Link so you can connect up to 8 other units and play against each other. The unit will retail for under $150, with six 1 Mb games also available for $34.99 each and more to follow. I asked if that was the name they were going to stick with (kind of long). Andy replied that they tried to find something else, but settled on the present one. The picture is very good, and I think it is far better than the competition, Nintendo's "Game Boy" (which I'll talk about later). The Atari unit will be available September '89 and will include the "California Games" game card.

One last thing of interest, the founder of Atari, Nolan Bushell, was at the show. We just missed him, but Andy told us he's currently working with Atari to make new games for the 2600 and 7800 systems. I'm kind of surprised, I would have thought he would be designing stuff for the ST.

There were several software companies there, such as Electronic Arts, MediaGenic (formerly Activision), MicroProse (with a new corporate name of "MPS Technologies" who will also be getting into the coin-op business), Broderbund, Soft-Kat distributor (which had many companies in its booth) and more. I have prepared a list of new software and it is elsewhere in this issue.

I mentioned earlier that several titles were coming from Europe which seems to be a trend, and we came across a couple companies from France. One is called UBI Soft, with titles "Rank Xeros," "Othello," and "Great Courts" coming to the U.S. market. The company was still looking for a U.S. distributor, so I can't tell you when they will be available.

Another company called Titus (20432 Corisco Street, Chatworth, CA, 91311, (818) 709-3692) have already brought or will be bringing six titles for the ST to the U.S., including "Crazy Cars," "Fire and Forget," "F40 Pursuit," "OffShore Warrior," "Galactic Conqueror," "Titan," and "Knight Force." The game "Knight Force" will be out in October '89. The Titus games will retail from $39.95 to $44.95 each.

GameTek is releasing "Wheel of Fortune Jr." and "Jeopardy Jr." in the 4th quarter. Spectrum HoloByte has "Flight of the Intruder," a Vietnam simulation with A6's & F4's (jets), also coming in the 4th quarter. A company called Pederson Systems from Europe is releasing "The Rings of Saturn" and Audiogenic Software will be shipping "Lone Wolf," "Wreckers," and "International Soccer" in the 4th quarter. I don't have addresses on these companies, except Spectrum HoloByte which is in the list.

I don't recall seeing anything in the Home/Productivity category or anything else besides games, but that is the flavor of the show. Everyone was pushing their games (read graphics) for the 3rd and 4th quarters (read Christmas). My advice to ST owners is, "buy it if you use it," otherwise more companies will drop off support for this fine machine. Pirating is everywhere, even in the MS-DOS world, but we have a lot less ST machines out there and when these companies look at the balance sheet and see MS-DOS and Amiga making more money, can you really blame them for leaving ST'ers behind?

Over at the Sega booth, they were proudly displaying their new 16-bit "Genesis" game machine (called the "MegaDrive" in Japan). Features include 512 colors, stereo sound, 68000 and Z80 CPUs, headphones included, 3-D like perspective, and with

Dr. Doom introduces one of MicroProse's new games.

INTRACORP, INC.
Capstone
Search for the Titanic

the "Power Base Converter," Sega 8-bit Master System cartridges (over 80) become usable on the new system. The unit will be available in Fall of '89 at a estimated price of between $179 and $199, with games from $40-$60.

Screen resolution for the Genesis is 320 x 224, as compared to a recently announced NEC 16-bit "TurboGrafx 16" game machine with the same resolution, while Nintendo's 8-bit (6502 cpu) NES system has only 256 x 240 with 52 colors. NEC's machine also has 512 colors, and although NEC was at CES in mobile communications, we couldn't find their video booth. The NEC is supposed to be using a Hu6502 cpu for its show and go.

Sega also announced the "TeleGenesis" system, which is basically a modem that players will be able to connect to their units, and up to two players can play head-to-head games over the phone lines. Although this isn't news to us computer users (we've been doing it for years), it is the first time it has ever been offered to dedicated game machines. It should be interesting, as Sega is playing with the idea (in Japan) of such services as home banking, electronic mail, home shopping, etc. Special TeleGenesis games are required to use the modem, and you can have a different perspective on both Genesis units. The release date is slated for late '89 (4th quarter).

SIERRA
POLICE QUEST
SPACE QUEST

Sega also had plenty of Genesis and Master Systems available with the newest games for play.

It's interesting to note that the old Atari 2600 has a 4-bit CPU, which I believe had only 4K of RAM internal. Look how far we've come!

Across the isle from Sega was the massive Nintendo booth. It was so large in fact, they gave us a map to find all the licensees (vendors) and new products on display. Needless to say, there was a lot of activity in this booth.

GAME BOY
Nintendo
GAME BOY

In the past, if you wanted to write a game for a game machine, there wasn't much stopping you. If you want to write one for Nintendo you'd have to get permission and a license from them. You submit your idea to Nintendo for okay, then write the code (program) and send it off to them. They manufacture and market the game, and you receive what they feel is the right quantity to sell. That is why some NES games are so hard to come by, one reason anyways.

So, what's the point of telling you this? Well a company called Tengen (a division of Atari Games) is sueing Nintendo for rights to make those games without all of that red tape. They claim Nintendo has a monopoly on the market and filed an anti-trust lawsuit against Nintendo in December of '88. Atari Games/Tengen also reversed engineered the NES cartridges and made their cartridges work on the NES without the special lock-out chip Nintendo uses.

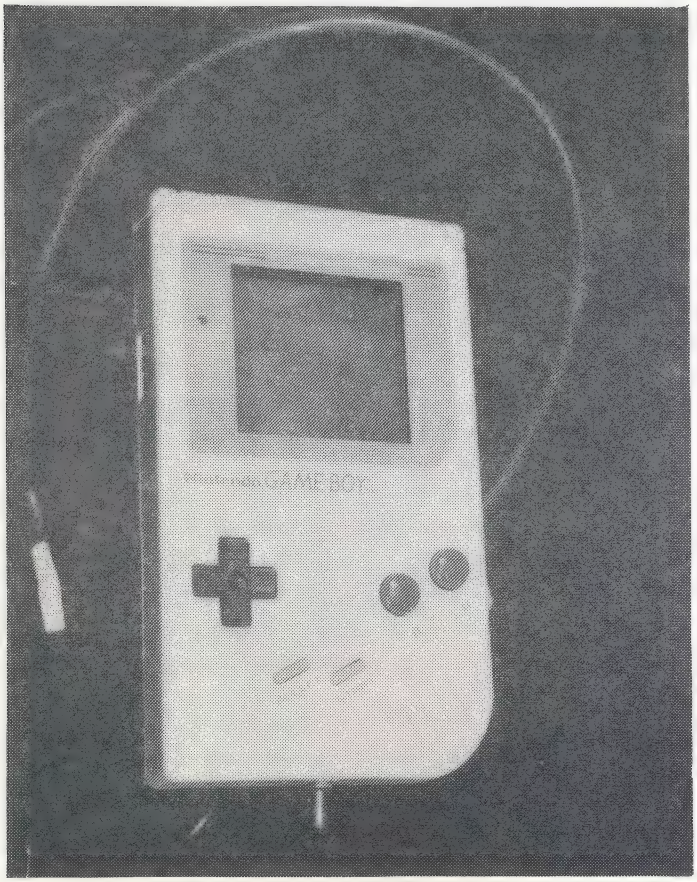
Nintendo responded with its own lawsuit because Atari Games/Tengen violated its licensing agreement, improperly received and used proprietary information, violated trademark laws and is violating the Racketeering and Corrupt Influence Act (RICO) by creating Tengen as a front company in order to defraud Nintendo.

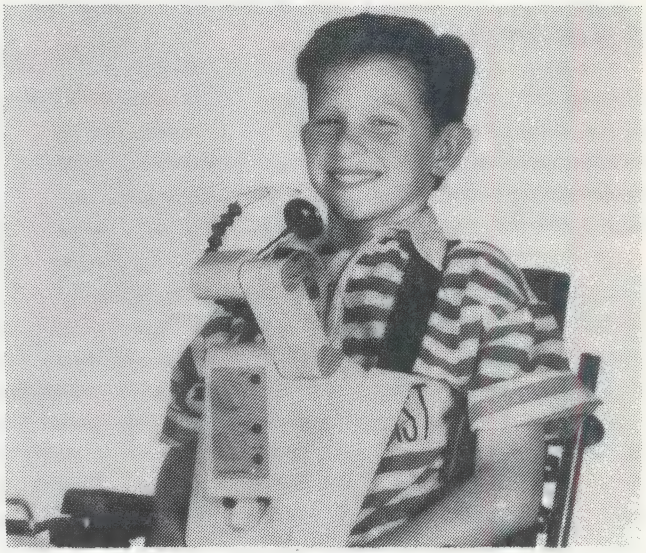
Atari Games Corp. is totally separate from Atari Corporation. Atari Games (if you remember) was kept by Warner Communications when Jack Tramiel first bought Atari (to become Atari Corp.) from them.

You've probably heard of the lawsuit in the news before. I wanted to mention it here because Tengen was only a stone throw from the Nintendo booth. I understand that it is possible to buy Tengen games, and they seem to be going on with the business at hand. The Atari lawsuit goes to court in late '89. There has been much press on this issue, and you might want to see "Computer Shopper" (May '89, p.181) for Stan Veit's Editorial.

Nintendo was showing off its new "Game Boy," a hand-held game computer not unlike Atari's unit. Nintendo's is 3.5" x 5.75" inches, weighs 10.6 ounces, has an 8bit cpu, 52 color LCD 2.5" display. It has stereo sound, uses cartridges (made for it), battery powered or AC adapter (optional), and will retail for $89.95 and be on sale August 1, 1989. Software will go for $19.95 each, and "Tetris" will be included with the Game Boy.

The Game Boy unit was the size of a paperback book, with a green/white display. The graphics were good, but I honestly think the Atari color unit is better. If you saw both units, you'd see a lot of similarity, such as the joypad, stereo sound, Comm-Link/Video-Link, etc. Nintendo's unit only allows play between two Game Boys with their Video-Link.





Aside from the Game Boy, Nintendo also showed the "Hands-Free" controller for physically disabled people to allow them to play NES video games. The unit uses a "sip and puff" tube to simulate the joystick or controller. The controller weighs 2.5 pounds, is worn on the chest and is available from Nintendo for $120. Another new product was the Nintendo "NES Satellite" which allows players to connect up to four different controllers, while being separated from the Control Deck (infra-red) up to 20 feet away. It also allows four people to play a game, provided the game allows it.

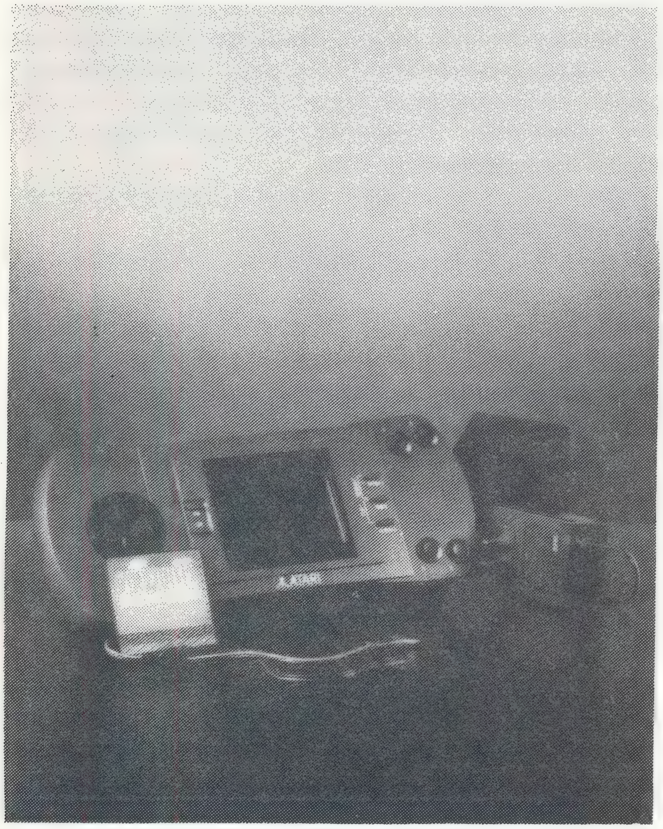
Nintendo was also showing "Tetris" for the NES game system, as was Tengen!

All of the vendors in the Nintendo booth had new games to show, and the controllers "U-Force" (Broderbund) and "Power Glove" (Mattel) were demoed. The "Power Glove" is a glove with three ultra-sonic devices around the TV which allow the player to move her arm/hand and control objects on the screen. Very impressive! It will be available Fall '89 in two sizes. The "U-Force" is two sections of black plastic, and you move your hands over its surface and it controls movement on-screen. Probably the best example of this is the boxing game "Punchout," where the player can use the U-Force controller to actually throw real punches and knock out the opponent on-screen! Both units debuted at the Winter '89 CES. "U-Force" will be available this summer for $69.95.

In the interesting products category, we came across the "Battletech Center." Think of it as a sit-down arcade machine, with a hatch that closes. There will be two sets of 8 units in a "Battletech Center," with one set of 8 split into two teams (four units each). One person per unit, with an intercomm for team members. There will be different games available to play, but basically you will be on a team trying to find and destroy members of the other team. The cockpit has several LED displays, two monitors, two joystick type controllers, one lever type for speed, and foot pedals for steering.

The game in use at CES had players fighting each other in giant robot-like vehicles. Each cockpit contains three proprietary computers with a total of 32 Mb RAM, which communicate with the other cockpits via a Local Area Network (LAN). The main viewscreen can display 200 3-D objects in real time, with a maximum of 64,000 colors on screen at any time. It uses a 34010 cpu at 40 MHz, with a 320 x 200 screen resolution, system RAM expandable to 130.5 Mb for the Graphics System (Primary).

Environmental Simulations Project (ESP) is the company responsible for the Battletech Center. Interested in opening one up? You'll need a 5,000 sq. ft. building and some start up capital -- only $750,000. ESP plans to develop 150 centers across the U.S. and Canada, with the first opening in Chicago at the end of '89. Contact: ESP Corp., 1026 W. Van Buren, Chicago, IL, 60607, (312) 243-4746. One more thing, "Battletech" the game is being made available on select personal computers, with additional modules also available. Being that Infocom is the company developing this version for home use, it won't be available on the ST. MediaGenic owns Infocom, so if you want to see this game on the ST, write to them at 3885 Bohannon Drive, Menlo Park, CA, 94025, (415) 329-0800.



Other interesting products include Cannon's "Xapshot," a camera that takes up to 50 still pictures and stores them on a two-inch disk (looks like a small 3.5" inch computer disk). Then, you can just plug the camera into the TV set and view the pictures. The unit has a CCD pick-up element (vs. a tube), RGB output, built-in flash, weighs 0.93 pounds, and more...for only $999. [Canon U.S.A., Inc., One Canon Plaza, Lake Success, NY, 11042]

Then, there was Hill Audio Products with "The Landscape Speaker," a loudspeaker you bury in your backyard! At $199 (8" model), you probably don't want to bury too many, but if you're having an outdoor party, this may make all the difference in outdoor music. Actually, the top of the unit is left uncovered, so music (or whatever) radiates up and around. [Hill Audio Products, Inc., 510 Charlotte Street, Longwood, FL, 32750-6370, (407) 339-890]

A device called "Current Deterrent" was shown by Mara-Dar Enterprises, Incorporated. You plug your TV or other electrical device into this little gem, and if the kids are watching too much TV, just turn the key to "off" and off goes the TV! It's like having a padlock on the TV, video games, etc. Better make sure your spouse doesn't have the key when your favorite TV show is on though! No priceon this one. [Mara-Dar, P.O. Box C-12339 #435, Scottsdale, AZ, 85267, (800) 344-3599

There were many other products and things to see, but I need to wrap this up. As far as Atari Corp. goes, I liked the Portfolio and hope it makes it to market. It's a nice little machine for $399. I've seen interest in at least one magazine (PC Resource, June '89), although a company called Poqet Computer is supposed to be bringing out their own small laptop, so we'll see. The STacy sounds good, kind of expensive, but if they wait too long we'll all be using 32-bit machines.

The Atari Portable Color Entertainment System needs a much shorter name...how about a contest to find one? Its a great little unit and IF they support it, it should be a really great unit. They will need to be in the mass merchandiser's hands before Christmas (before Game Boy) with software available too. Otherwise, they can kiss it goodbye.

Nintendo's Game Boy isn't cheap either at $90, and Nintendo will sell more of them than Atari will sell its system, but I believe Atari's is better. That doesn't mean Atari will win, look at the Sega 8-bit Master System. There are many who believe it is the better system, but the Nintendo NES has won hands down. It will be interesting to see Sega's Genesis system make it; I think this puts Atari's ideas of a 16-bit game system in serious doubt. If NEC brings one out and Nintendo announces one next year, Atari would have to get on the ball with production and software for one (would it use a disk drive or cartridges?). This is not Atari's greatest ability.

I guess you've seen my skepticism sneak in, but I've been an Atarian for many years and have heard a lot of empty promises from my favorite computer company. Come on Atari, I'm not from Missouri, but I want you to "show me!"

New Atari ST Software

compiled by Jim Kennedy (MACE)

The following list of software has been compiled from news releases of the numerous software companies present at the 1989 Summer International Consumer Electronics Show (CES), held in Chicago, IL. Some smaller software companies have their software distributed by a larger company (ie. Mediagenic) so these will be listed under COMPANY as "distributor/smaller company". They maybe known as Affiliated Labels (AL), Electronic Arts has several AL's.

Under the SHIP DATE column, "NOW" means it should be in the stores by the time you read this! All SHIP DATES are for 1989, unless otherwise noted. "3Q" (third quarter), "4Q" (fourth quarter) means delivery will be sometime in (July, August, September) and (October, November, December), respectively. Under the PRICE (Manufactures Suggested Retail Price) column, several companies had not set prices yet, if interested, check with your dealer or call/write the company. Every effort was made to show the correct information on each item.

For 520ST. 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.
Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A: Socketed, no RAM	$129
520B: 1 MB, socketed	$249
520C: 2.5 MB, socketed	$495
520D: 4 MB	$795
520-1: 1 MB, non-expandable	$199
1040A: 1 Bank sockets, no RAM	$110
1040B: Fully socketed, no RAM	$149
1040C: 2.5 MB + 1 bank sockets	$495
1040D: 4 MB	$795
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 3-22-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.
Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available!
Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Wizball

by Bob Retelle (MACE,WAUG)

Wizball is one of those rare games which combine great graphics and smooth scrolling with a truly unique play mechanic. On top of that, it's one of those even more rare games that don't cost an arm and a leg! My copy of Wizball was only $15.95 at a local store.

Unfortunately, the packaging really doesn't do the game justice, and I probably would have passed it over if I hadn't run into a true Atari fanatic at the store that day. He was making his monthly pilgrimage from the Toledo, Ohio area to the Detroit area stores to see what was new in the Atari world. He recommended Wizball over the more expensive games I'd been looking at, so I decided to give it a try.

The story line for the game sounds an awful lot like Attack on Pepperland by the Blue Meanies. Wizworld has been attacked by the evil Zark, and all color has been drained from the landscape. Wiz (you) and his faithful companion Catelite have to kill the horrible sprites guarding the world and restore color to the land.

Unfortunately, a "truly unique play mechanic" doesn't always translate into an easy-to-play game. When you first enter the game, the "Wizball" which represents YOU is bouncing helplessly around the screen. You can control the speed and direction it rotates, and thus the speed and direction it will bounce, but with virtually no control over where it goes. I spent many frustrating hours trying to do something more than die instantly when my Wizball bounced into one of the enemy sprites. The instructions are very unclear about what to do, though they do allude to "icons" which will give your Wizball more powers.

I can understand the game designers wanting to leave some things up to the players to find out for themselves, but something as basic as how to control the character on the screen should be fully explained.

The first set of aliens you encounter look like slowly spinning DNA molecules which don't move around at all. The only danger from them is that your wildly bouncing Wizball will touch them and be destroyed. If you manage to shoot one of these, it turns into a green "pearl." Running over the pearl (easier said than done) will cause an icon at the top of the screen to flash. Each subsequent pearl causes the next icon in the row to flash. If you "wiggle" the joystick back and forth while a particular icon is flashing, your Wizball will gain the power the icon represents. Ah...! A light dawns..! The first icon lets you move the Wizball left and right with more control, although it still bounces wildly. The one that appears in the first icon position after that will give you COMPLETE control over the Wizball!

Once you've managed to gain control by obtaining these icons, the game becomes completely playable, and enjoyable. In a way, it's ironic that the difficulty of the game actually DECREASES as you play. With more icons, you gain better firepower and shielding, while the game itself really doesn't increase in difficulty very much from level to level. I wonder how many beginning players will simply drop the game out of frustration, before they discover how to gain control and really enjoy the game.

There's one picky little complaint that I had about the game design. There's no "start the game over" or suicide button to let you restart a game that's going badly. With many games this really isn't necessary but I've found, even now that I know what to do, I may die almost instantly, wasting one of the three Wizballs. I'd rather just start over, but no convenient way is provided. If you think staying alive is a challenge in this game, try dying on purpose...it's just as difficult!

One of the icons brings the Catelite into play. Simply killing the nasty sprites with your Wizball isn't enough. Some attack waves, instead of being sprites, are serpentine strings of paint bubbles. The Wiz must shoot the bubbles, releasing the paint droplet inside. Unfortunataly, Wiz cannot collect the paint himself, so he must direct the "Cat" to catch the droplet. This action involves another part of the rather unique play mechanics of the game. In a one player game, you must learn to coordinate controlling both the Wizball and the Cat with the same joystick. By holding the Fire Button depressed, the joystick takes over control of the Cat, allowing you to grab the paint droplets. Unfortunately, this also freezes the Wiz, sometimes fatally, until you release the button. It's an action that takes some getting used to, although it's not all that hard to learn.

In a two player "team" game, one player controls the Wiz, the other controls the Cat. The only problem with this arrangement is that the Cat player spends a lot of time just watching, until the Wiz player can manage to get the Cat icon activated. The Cat has a limited life, and contact with nasty things will eventually cause it to die, leaving the Cat player as a nonparticipant again, until another Cat icon can be earned. (Listening to two young Wizball players, you'll often hear "I wanna be the Wiz this time!!")

There are many special features in the game, such as paint droplets that confer extra lives on the Wiz or the Cat, and ones which will cause more undesirable things to happen, such as turning out the lights!

The object on each level is to collect paint droplets of three different colors, and fill the "color cauldrons" at the bottom of the screen. Each level has only one color available, and at the beginning of the game you're limited to Levels 1 to 3. When you fill the "target cauldron" with the colors for that level, you're given a bonus round, and then a trip to the "Wizlab" where you can trade in the bonus points for permanent icon powers, or take the points for a huge score increase.

By the time you get several of the permanent powers, you'll find your Wizball will be almost indestructible unless you get careless. As I mentioned, the difficulty of the later levels really isn't all that much higher, so there isn't quite as much challenge as there could have been.

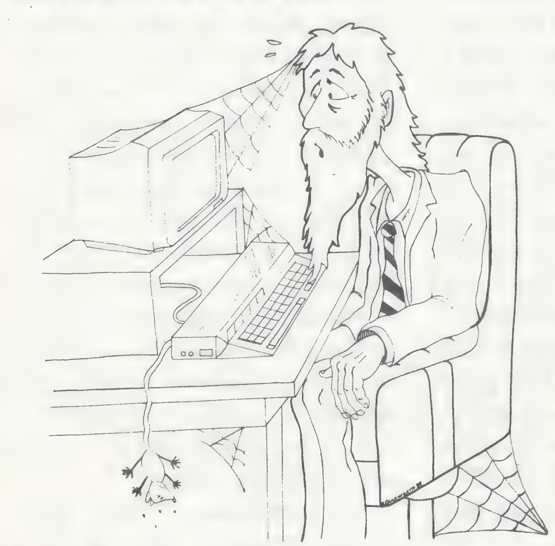
Finding the entrance to Level 3 can be rather frustrating. I spent a long time wondering why I couldn't get another bonus level before I noticed that one of the "tubes" between levels had small markings which looked like an arrow pointing down. This turned out to be the secret entrance to Level 3, but I almost gave up on the game before finding it.

Other levels use different devices to indicate the direction which the tubes will take you, but none are as hard to figure out as the first. One other thing I ran into was that the game seems to have a problem with its "ending." The ST version has 8 levels, which you have to run through several times each. There comes a point where you can't advance any farther, but the game doesn't end. You're left on your own, shooting things, but without any further challenge. I'm still not sure whether I'm missing something else or whether the game designers never expected anyone to reach Level 8.

Even with all my picky little complaints, I like this game...very much. It's the kind of game that grows on you, assuming you stick with it long enough to get past the initial high frustration it presents you with. The music in the game is excellent, and the graphics are extremely well done. The backgrounds for the different levels are very imaginative, and the enemy sprites come in a wide variety of extremely colorful shapes (one of them looks like a cloud of maurading Compact Disks). Wizball is an excellent value for anyone who's looking for something "different" in a game.

Wizball is a product of Ocean Software Limited, distributed in the U.S. by Mindscape, Inc.

How much is YOUR time worth?



Turbo ST turns your 520/1040 ST into a speed demon. Check out **Turbo ST** at your local dealer or download our free demo from your favorite bulletin board.

Upgrades to version 1.6 are only $5 with your original disk. For more information, call (407) 657-4611, or write to SofTrek, P.O. Box 5257, Winter Park, FL 32793.

Epson Emulator for Atari Laser Printer

by Graham Thomas

Well, Atari UK finally released the Epson FX-80 emulator for the Atari laser printer, the one that some other European countries have been selling for months. As usual, Atari made a bit of a mess of it.

Pluses

First, the good news. The emulator itself seems to be basically OK, though not perfect.

Using it with First Word Plus, we've found it occasionally loses its way and forgets to print a chunk, or prints the same paragraph several times over. Reprinting usually solves the problem, and I'm not sure what exactly causes the glitches.

IMG graphics in Wordplus documents now print out very nicely, and at the correct size as indicated on screen. Screendumps are also nice, in any one of five sizes from postage stamp to A4 (provided you have the RAM for the latter - you may need up to 1 meg for the buffer!).

The set of fonts which Atari has included lets you print text in pica, elite and (non-standard, 5cpi) expanded formats, in the most popular styles (bold, underlined, italics), and with proper sub- and superscripts (except for expanded).

Minuses

The bad news is: no condensed print (font not supplied), no 1.5-line spacing (fontheight governs linefeed, so until someone produces a set of 1.5-line high fonts...), not all combinations of styles in all typesizes. The emulator can handle several different font formats, including GDOS fonts, so improvements are a matter of putting together better font libraries (again, you need lots of RAM) or waiting for kind souls to submit their collections to the PD libraries.

Helpful tips

One important tip for users of First Word Plus: use the INSTALL.PRG from your version to reinstall the PRINTER.HEX file supplied with the emulator.

The PRINTER.CFG file supplied by Atari is likely to be for a different version from the one you have. (My suspicion is that it's the one for the German version current in November 1988 - the PRINTER.HEX file has a lovely German explanatory preamble, which shows how much customising Atari UK did!) Finding this out lost us an afternoon.

Documentation

The documentation with the emulator is a 60-page booklet which, although at times a little cryptic, is adequate. It's therefore a huge improvement on the non-documentation that was sent out with the Diablo emulator.

We haven't tried printing from a self-written C, Pascal, Basic or whatever program yet, but the docs appear to provide enough information on the necessary control codes, including the extra ones that make the laser printer do a few things a real dot matrix printer can't.

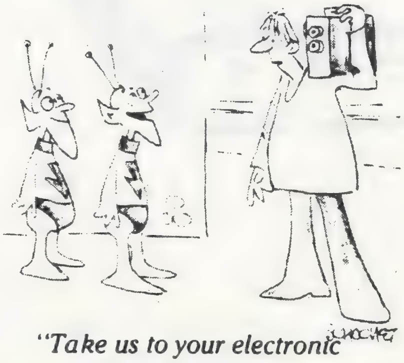
Verdict

OK so far, but I was let down by sloppy presentation on the part of Atari UK. The people from the German firm DMC, who wrote it, seem to have done a pretty good job. Now we need a better set of fonts. Cost is 29.95 UK pounds.

Post Script

I keep asking about Ultrascript, but Atari UK won't say when that might see the light of day in the UK. They really aren't committed to getting the ST into business and educational markets, whatever they say in their press releases. Shame.

[Editors' Note: Graham Thomas can be reached by mail at: SPRU, Mantell Building, University of Sussex, Brighton, BN1 9RF, UK or Phone: +44 273 686-758.]



"Take us to your electronic game center."

A New Shareware Program from Bob Puff

by Stephen Moffit (TACE)

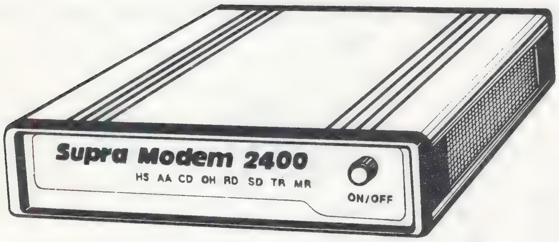
(c)April, 1989

This is a program for Atari 8bit users who wants it all (well, mostly all!) for their "modeming" without having to spend a lot of money on it. (I know you, ahem, cheapskates are out there. I am one.)

BobTerm's Requirements

This is a nice program that will work with your modem through the 850, P:Rconnection, all known RS-232 interfaces and most direct-connect modems (such as the SX-212).

A minimum of 48K is required — giving you an 11K buffer!. Note: Other than the MIO, the "Black Box" and the 850/ P:Rconnection, no support is included, so you will need a modem driver from another source. Bobterm has been tested with many DOSes including MyDOS 4.5, which he wrote, and SpartaDOS X.



BobTerm's Features

Okay, now some features (I bet you couldn't wait!):

Translation options included are: ASCII, ATASCII, and VIDTEX, a CompuServe translation mode.

Baud RATE: Up to 19.2K (for null modem through-put).

Duplex: Full and Half. It will also echo characters from another modem if that other computer is in full duplex, called Echoplex.

Dialing Type: Will dial both tone and pulse, assuming your modem or phone system will support it. MPP does not support Tone dialing. You may send Originate, Send a Carrier (Answer Mode), and Hang Up (provides for modifying for modems that do not support this).

Added Features

I know, no transition, but... Some other features include quitting to DOS without dropping the carrier so you can load other programs such as ARC!

Did I mention the transfer protocals? No? Well they are XModem, XModem-CRC, 1K-XModem, Ymodem(batch), CompuServe Fast XModem (meant to speed up THAT XModem) and Fmodem (also ASCII XON/XOFF).

You may do most DOS functions from here, including loading a file which may be used to load modules in the future. BobTerm supports sub-menus when using DOSes that support that function. You have eight "large macros" of 31 characters each and eight "small macros" of 15 characters each. You also can define one character macros for up, down, left, right, and fire button on your joystick! Automatic AsciiAtascii translation (and back) is offered.

In Summary

I would say that the dialing menu is somewhat similar in look to the Express! menu, and as such is quite nice.

My impression of this program is that it is a very nice program with a better "look" then Express! and a better "feel." I have uploaded large files at 2400 Baud using 1K-XModem and met with easy success. The documentation file is about 15 pages long and is quite complete.

Once again, Bob Puff offers us a professional quality program at a decent price (a donation), we should thank him for this quality program and reward his efforts.

Single-Sided to Double-Sided ST Disk Upgrade

by Rod Smith (WAUG)

Are you an ST owner with one single-sided and one double-sided disk drive? Annoying, isn't it, not being able to directly copy a file from one double-sided disk to another. Or do you perhaps have only single-sided drives? Wouldn't it be nice to halve the number of disks you've got by making them double-sided?

Well, you can! The ST's disk drives are pretty much industry-standard, although the connections to the ST are not. This means that, if you've got an SF354 single-sided drive, or an internal single-sided drive, it's possible to replace it with a double-sided mechanism for about half the cost of a new double-sided drive from Atari. For 520ST-FM owners, in fact, this is the *only* way to upgrade to a double-sided drive, short of trading in your computer for a 1040ST.

Some Caveats

This project, while not terribly complicated, is not for the faint of heart. It involves opening up your ST's drive (or your ST, in the case of internal drives) and swapping components. As such, it will void your warranty, assuming it's not run out already.

I can make no guarantee that it will work for you, especially if your system is different than mine or you use a different drive than I did. You may have trouble getting the new mechanism to fit neatly in the old drive housing. You will also likely be out the cost of the replacement mechanism if something goes wrong.

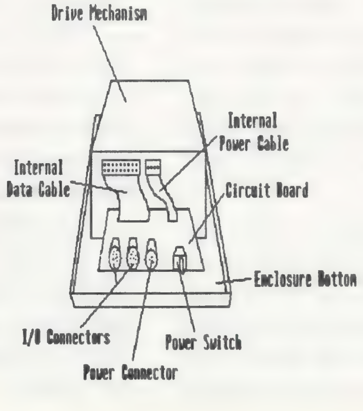
How I Did It

Bearing these caveats in mind, then, how is it done? The procedure I'm about to describe is how I replaced my SF354; the details will likely be different for you, since my SF354 was very old (with an eject button in the lower right-hand corner) and since you'll likely get a new double-sided mechanism from a different source.

My adventure began when I saw an ad for an external 3.5" drive from Radio Shack on sale for $99.95 (catalog #25-1061). This was a lower price than I'd ever previously seen on such mechanisms, so I decided to go take a look, and ended up buying one.

Other sources for 3.5" mechanisms can be found in ads in electronics magazines and Byte. One such source is Jade Computer, in California. Their phone number is (800)421-5500. You could also check with local computer stores; ask for a 3.5", double-sided drive mechanism for an IBM PC. A typical price seems to be about $120 for what's generally a kit for mounting the drive in an IBM PC. If you're replacing an existing mechanism, you won't need a power supply, drive controller, or extra mounting hardware, so don't pay extra for these things.

SF354:
The Inside Story



If possible, buy a drive with an eject button and "disk busy" light which are in the same location as they are in your existing drive. This is especially important if the drive does not include a case or if you're buying it to replace an internal drive. I'd avoid drives marketed for the Macintosh, since Mac drives have been modified in strange and mysterious ways, and they're thus more likely to give you troubles than more traditional drives.

When I got my new drive home, I opened up both it and my SF354 (after unplugging the drive from the wall, of course). The SF354 has seven screws on the bottom. Remove the four outermost ones first; this will allow you to remove the top cover of the drive. The remaining three screws hold the drive mechanism in place, and these should be removed as well.

The Heart of the Beast

You now see the workings of your disk drive, as illustrated in the figure. There should be a small circuit board, with a pair of cables leading to two connectors on the drive mechanism itself. The larger cable carries data signals to and from the drive, while the smaller feeds power to the drive. Your new mechanism should have similar connectors, and possibly a circuit board of its own.

Disconnect both cables from your single-sided mechanism and plug the cables into the new mechanism. The cables may be difficult to unplug. I used a small flathead screwdriver to pry them apart. *Be careful* when doing this, though; snapping off one of the prongs could cause serious problems. When I did this, I actually moved the circuit board from the SF354 to the Tandy drive, rather than swap the mechanisms, since this was quick and I wanted to test the setup. *This is something you should do.*

When you've plugged the new mechanism into the SF354's circuit board, you can test the drive. Plug it in just as you would the SF354, and turn on your system. When I did this, I found that my new drive didn't work! After a few minutes of near-panic, I discovered the trouble.

The Teac drive mechanism which Tandy used had a number of pairs of pins on the top of the drive mechanism, some of which were covered by metal-and-plastic caps, so as to make an electrical connection between the pins while insulating them from other pairs of pins. Some of these pins were labelled "D0," "D1," "D2," and "D3," and a cap was placed on the pair labelled "D1." Since I knew that every ST drive "thinks" it's the first drive, and since these labels looked suspiciously like drive numbers, I used tweezers to move the cap from "D1" to "D0." I then re-connected the system, and everything worked! Other mechanisms may have a different means of selecting drive number, so you may have to examine your drive carefully in search of such an option, should it not work when you first connect it to your ST.

All The King's Horses...

Now it's time to put everything back together. Since the Tandy drive I purchased had an eject button immediately below the center of the drive slot, in a very different location than the placement of the button on my SF354, and since the Tandy came with its own enclosure, I decided to leave it that way. I replaced the metal RF (radio-frequency) shielding and discovered that the cables to the connectors (which necessarily sat rather far within the housing, since the Tandy drive is deeper than an SF354) would not fit through the only hole in the housing. Fortunately, the top and sides of the housing are plastic, so I merely cut out a corner in the back large enough to admit my power cables. It was then simply a matter of putting the cover back on.

This setup has the disadvantage of an inaccessible power switch and cable connectors. Since I have a surge protector/power strip, this isn't a real concern for me, but it might be for somebody else. Those wishing to place a drive in an Atari housing will likely have to remove the front pieces of the drive mechanisms and swap them. This might be difficult, since there's no guarantee that mounting screws will be located in the same place (they aren't on my drives).

As mentioned before, eject buttons and activity LEDs may be placed differently, as well. It may even be necessary to cut holes in the front of your Atari drive (or 520ST-FM case!) to get everything to work. Once you've worked through this problem, you might have trouble mounting your drive in the SF354 case, since (as with the faceplate) mounting screws are not guaranteed to match. Once you've worked around any of these problems which may arise, put the case back together.

One possible way to avoid these problems altogether might be to open up your drive before even purchasing a replacement mechanism. Find the manufacturer's name and any other identifying marks, such as model or serial numbers. Then look specifically for the equivalent double-sided drive. Since Atari has used several different makes of disk drive, there's no guarantee that your neighbor's drive will be the same as yours, or even that your two drives will be the same inside.

In other words, examine whatever drive it is you're going to upgrade. If these problems prove nearly insurmountable, don't panic! You could nail together your own wood enclosure, or perhaps use something else, such as a lunch pail or even (gasp) a "generic" external drive housing. These options are less viable for 520ST-FM owners, but they might still be workable if you construct extension cables for your data and power lines.

Some Speculation

If you want to buy a non-Atari drive as an *addition* to your system, rather than as a replacement for an existing drive, it may be possible, but would require additional equipment. Depending on the drive you get, you may need an enclosure. You'll also need a power supply and appropriate cabling to reach the new drive. Your situation in this case is basically the same as connecting a standard 5.25" IBM drive to your ST. I refer you to David Small's article, "ST Uses IBM Disk Files," in the November, 1985 issue of Antic magazine for more details. I'll add, though, that the additional hardware purchases necessary for such a project will likely bring the total cost to near what you'd pay for a new SF314, so it's probably not worth the effort unless you already have some of the necessary components gathering dust in a closet.

All Done

With any luck, you've now got a functional double-sided drive where you used to have a single-sided one. So far, my new drive has read every double-sided disk I've put into it, and my old double-sided drive has had no trouble with disks formatted by the new one. The new drive will format (and read) to 83 tracks of 10 sectors each, so I have no difficulty using extended formats.

I have encountered one problem, however: the new drive seems to be less-than-diligent about reporting disk swaps to the ST; sometimes it will report them, other times not. This is not a major problem, however, since certain actions, such as placing a write-protected disk in the drive, will force correct behavior. Other drives may or may not have this problem.

I certainly hope that anybody attempting this modification has as much luck as I've had. I've heard of it being done before, so I know that my case isn't simply a lucky fluke. I welcome any questions or comments. Send them to AIM or post them on the Treasure CheST BBS (313-973-9137) or Molin's Den (313-420-0407) BBS.

... the way the ST could have been is now a reality ...

QUICK ST and the Quick Family of Shareware

"The reader program is outrageous. It's great! The latest version of Quick ST is extremely reliable and well worth the effort..." Ralph Mariano, editor/publisher ST Report Online Magazine

by: Darek Mihocka
Ignac A. Kolenko

Quick ST

only a $20 shareware contribution to register!!

- speeds up screen output
- handles both **VT52** and **GEM** text output
- supports RAM-loaded fonts (Turbo ST doesn't)
- fully configurable - runs as desk accessory or as a standard program - simply rename it!
- uses only 32K main memory
- supports Hyperscreen and other non-standard screen sizes (Turbo ST doesn't)
- does not require blitter chip
- works with all standard desk accessories & TSR's

Turbo ST is a trademark of SofTrek

for an additional $10 contribution, you will receive 6 extra Quick shareware titles:

Quick View

- views any text file quickly
- view Atari 8 bit files as well
- display 25 or 50 lines on mono
- more powerful than Desktop 'Show' feature
- configurable as "installed application"
- automatic table of contents generation for reading ST Report Online Magazine

Quick Find

- allows the user to perform group file operations on any combination of drives/hard disk partitions
- allows any search mask to be used
- options include: search, touch, hide unhide, write protect, un-write protect, delete and 'arc' bit setting
- can print to screen, file or disk
- easy to produce disk catalogs with this program

Quick Index

- the **de-facto** benchmark for the Atari ST
- benchmark 3 main catagories:
  - CPU performance
  - disk performance
  - screen performance
- use it to benchmark Quick ST, the blitter, 16MHz boards, disk formatters/drives, OS patches
- TOS 1.0 & 1.4 reference figures

Quick Inf

- allows easy editing of various desktop parameters not editable from the Desktop normally
- easily add multiple installed applications (Desktop can't)
- change the window search masks (Desktop can't)
- change drive/trash icon names
- load in new DESKTOP.INF at any time

Quick Label

- allows the editing of 10 labels at one time.
- simple, but powerful printer format commands built in
- change configurations at will
- print multiple copies of any combination of labels
- label consists of 10 lines of up to 40 characters each
- easy to use user interface

Quick Print

- fast, text-only screen dumps to the printer
- similar to the print screen feature found on pc's & clones
- excellent for VT52 screens - receive your screen dump in seconds rather than the minutes it usually takes for graphic dumps
- configurable accessory

All titles work on any ST with at least 512K RAM, colour or monochrome
We are **always** listening to new suggestions and ideas. Reach us at:

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Atari Interface Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

FISHIN' AROUND by Brent Fisher

Well 8-bit owners, it looks like Atari is going to support us after all. A couple of months ago Atari Explorer Publications came out with their first issue of Atarian Video Game Magazine. In there I found (believe this or not) a previews section. In this section Atari announced that they are bringing out Commando, Ikari Warriors and Xenophobe for the XE Game System (this includes us XE and XL owners too).

These guys even had an interview with Nolan Bushnell in the May/June issue. But it does indeed look as though Atari is going to support us, at least with as many games as we are willing to buy. I personally like the looks of some of the video games that they had in there, I just wish that they would bring out some of the out of production productivity software that would really be useful, but of course only time will tell.

Anyway this new magazine isn't too bad for two bucks, I just can't figure out why they would want you to get a subscription when it is cheaper to buy it from a bookstore. The subscription fee is $12. While the newsstand fee is $11.70. Not a great deal of difference but at least it'll get you out of the house for some exercise.

Well on with some important news. Yes, the C.A.C.E. BBS is up and running. Yes I know that we had it down for a while, but we were only making some improvements. So if you have a modem and would like to tell us if we did it right or wrong give us a call at (517) 787-4011. We would love to hear from anyone, who likes Zmag and a good conversation.

All of you golf fans out there (well those of you in the 8-bit

world anyway) will be interested in knowing that Atari is releasing Mean 18 Golf sometime later this year. With a little luck maybe they will have it with them when they come to the World of Atari show in Detroit. Yes if you are reading this and you didn't make it to the show you missed it. But don't fear I promise to tell you all about it since I plan on going and seeing everything possible.

Does anyone read my column just to find out when the next meeting will be? If you do I suppose that I should just come out and tell you all when it will be. But then again I am kind of torn between letting you know now or waiting until the end. Ah, what the heck, the next meeting will be on Sunday, July 9th. So I hope that one and all will come and join us at the East Side Lounge, on the corner of Ganson and Horton.

I was reading Zmag issue 160 and in there I noticed Jerry Cross reviewing a book called Master Memory Map. He said that he liked it better than the wonderful Atari treasure trove Mapping the Atari. He also talked about the Authors Robin Sherer and Craig Patchett. If I'm not mistaken these two people have been writing columns for ANALOG for the past year. In fact Robin Sherer's column was entitled Master Memory Map. So if you can't get a hold of Zmag 160 or the book that Jerry wrote about (there should be no reason not to, all you have to do is call the C.A.C.E. BBS), check out the last ten issues of ANALOG. I believe that this is probably one of the finest tutorials on the Atari 8-bit memory locations around.

Anyway people, that's the news and I am out of here.

CAPITOL HILL ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

GENESEE ATARI GROUP

Serving the Flint area

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Inc.

GAG meets on the second Wednesday of the month at the Neithercut school, located at 2818 Crestbrook Drive, Flint. (Off Atherton between Hammerberg and Van Slyke). Meetings begin at 6:30 pm. All are welcome. GAG is a participating member of the Atari Interface Magazine, and members can purchase subscriptions at a greatly reduced rate. GAG is also affiliated with the Great Lakes Atari Digest, and members receive a free subscription with their membership. Membership is $15 per year for the family.

GAG has an exceptional public domain library of 8- and 16-bit software. Contact one of the officers to receive a complete catalog. GAG also has a large magazine library for use by it's members, including Antic, Analog, ST-Log, Start, and several others. We do not support piracy. Piracy is theft!

For more information contact:

Next meeting: Saturday, 09-Sep-89. We are not scheduling meetings for July/Aug this year. Your AIM will come in the mail as usual...if your dues are paid, of course.

For those of you that would like to know what happened to the June meeting... its too late now.

I, for one computer member, have been very busy trying to rewrite some of my programs for my Star NX-1000C Rainbow printer. I have been working on disk labeling programs. I wanted to be able to select any of the seven colors available on my printer so I can make my labels more appealing and categorize them by color instead o? buying colored disk. I have been quite successful even with my limited knowledge of programming.

I have given out this program before, and it is still available to our members... contact me if you have use of this color upgrade.

I started this project because I have not seen many utiltity programs available to take advantage of the color printer capabilities.

I also installed a US Doubler in my 1050 drive. It works just fine, but I had to take the drive apart twice because I didn't have a IC socket adapter. The directions mention you may need one, but you don't know until you take it apart at least once. As it turns out, I really need two since my drive was manufactured in Singapore. The socket is available from ICD for $4 each. This has a tendency to increase the price of the US Doubler, but it has been working just fine.

I have been using my SPARTADOS-X cartridge for a month or so. I am getting better...I have been able to access the drive on startup, know how to write the boot files from DOS and am able to go back and forth from DOS without losing my Basic program. Basically, it has improved my access time getting into my programs.

Haven't had a chance to get together with any of the officers, but I should within the next couple of weeks and I will be able to check up on what new items they are working on.

I hope to keep you informed for the next two months, so check your AIM.

Call me if you want to consider a new position of leadership in the club. I may not be able to continue in this position this next fall.

Frank

Great Lakes Atari ST Support 'GLASS', Michigans only 'ST' only Users Group I ♡ my ST!

With summer vacations here there is not to much to write about. The July and August meetings will be informal show and tell get togethers. If you are coming to them and have anything of interest, unusual, or a new way to use an old product, bring it to the meeting and show it. We'll try to have a few things there, including the disk library data base as it gets further along.

I am looking forward to the World of Atari show in Dearborn, these shows are great to browse around, find a few good deals, and catch up on the new stuff out for the Atari. I hope to see some of you down there (of course this will be past by the time you read this). HAPPY COMPUTING TIM

M.A.C.E. M.A.C.E.
MACE
MICHIGAN-ATARI-COMPUTER-ENTHUSIASTS

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE Minutes, June Meeting

The June '89 meeting of the Michigan Atari Computer Enthusiasts was held on Tuesday, June 20, at the Southfield Civic Center. Meeting Coordinator Bob Retelle called things to order at 7:45pm noting the feature topic would be "New Users" in which novice Atarians would be able to ask any questions they might have about using their computers. Bob then went on to discuss what's new in the Atari world, ranging from TOS v1.4 to new/upcoming releases of games for the XE game system to announcing that Astra Systems had gone out of business.

With help from members Mike Lechkun and Brian Wilmoth, Bob described the recent Consumer Electronics Show which was followed by a video tape, complete with narration by former officer Jim Kennedy.

Bob polled the audience for questions about using their 8-bit computers, and (to his surprise) got NONE! It would appear there are either no new users or they are all very shy! Bob then easily answered the three questions he got about using an ST, and then went on to show the "ST Intro" program and announced it was available in the ST Disk Library.

There was some discussion about the upcoming (this weekend...) World of Atari show to be held at the Hyatt Regency in Dearborn. Flyers were available and members Mike Lechkun and Jerry Cross sold advance tickets for $3/one day and $5/two days.

Bob announced there was a paper bag full of current and back-dated issues of Video Gaming magazines which had been donated by Soft House of Garden City. (Many thanks to Larry Berman for his support.) The meeting was adjourned at 9:45pm.

The next meeting will be held on July 18 and will feature (tongue in cheek) "Those Useful Programs You Should Avoid." If you've got a gripe about a particular piece of software, now's your chance to vent some frustration! Contact any of the MACE officers if you'd like to share your grief with the rest of the members.

Michael Olin, MACE Rec. Sec'y 6/21/89

Added Notes:

September is just around the corner, which means officer elections are coming! All positions are "Up-for-Grabs," so if you'd like to help MACE continue its strong support of the Atari line of computers, please support MACE by volunteering and running for the officer position of your choice. Remember that officers of MACE receive a free year's membership in addition to the free membership while they're in office. If you'd like to know what a position involves, just ask the current officer! Most of the positions only take a few hours time a month and help the club tremendously.

The new and exciting terminal program from Bob Puff called BobTerm is available from the MACE library, complete with printed documentation! The special price for the complete package is only $5. MACE also selling 8bit disks for $2.50 for 10 disks and ST disks at $8 for 10 disks. If you're ordering through the mail, please add $1 per 10 disks ordered. Quantities are limited.

TINKER ACE OF OKLAHOMA

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at Route 5, Box 539, Blanchard, OK 73010 or at the TACE BBS (405) 755-9561, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Corrrespondence - $15.00.

President	Michael Beard	(405) 793-7978
Vice President	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Greg Yelle	(405) 390-9184
BBS SysOp	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649

Please note the TACE address has changed to:
Route 5, Box 539,
Blanchard, OK 73010
and the TACE BBS number is also changed to:
(405) 755-9561
with Rick Spencer as the new SysOp.

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the last Saturday before the 18th of the month, at 2pm at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township. Upcoming meetings are July 15th and August 12th, 1989. Officers:

President	Steve Volker	(517)793-2955
ST Librarian	Leroy Valley	(517)686-6796
Treasurer/Sec'ry	Marty Schmidt	(517)792-6029
8 Bit Librarian	Ted Beauchamp	(517)686-8872

Club dues are still only $20, which provides support for both the 8Bit and ST, and full access to the club's PD library, along with a year's subscription to the Atari Interface Magazine. Check your mailing label, if you need to renew,(or haven't joined us yet!), DO IT NOW!

First Up... At our June meeting, being election time, the following individuals were "subscripted" into officer positions:

Steve Volker was nominated, elected, and assumed the duty of overseeing the meeting, just in time to participate in the formal voting, during which he was elected. Leroy Valley acquired the duties of ST Librarian and Technical Advisor in abstentia, but was later notified by phone. Marty Schmidt and Ted Beauchamp were not consulted, but were re-elected anyway. Free will government in practice. Sigh...

What You Missed... Bryant LaFreniere DAZZLED us with an amazing demo of,..well, let's see...he had Multi-Desk, EZ Draw (w/SuperCharger), and Mouse Accelerator installed in his Desk Manager, added EZ Tools, Scan Art, and Draw Art Pro, and ran it through CodeHead's new Hot Wire, while using Macro-Mouse to present a fifteen minute PRE-programmed demonstration of EZ Draw, with speech synthesis. Hmmmm... Anyway it was great! Bryant put some real work into this one so how about a good round of applause.

What You Shouldn't Miss... Wayne Fenior, our newest member, will be demoing MasterCad on his Mega 2. Just moments after paying his membership dues to Marty, we put him to work! (Not bad, huh?) By the way, Wayne is the new ST Sysop for Charlie BBS with Paul Benkirt. He left us a few numbers; Saginaw (793-1014), and Freeland (695-2032), and said CALL!!

On the 8Bit side, Ted Beauchamp will be demoing MovieMaker next month. This amazing animation program has a lot of surprises, so come and watch it with us! Also, Ted has offered to track down some information on the new 16Bit upgrade board shown at the Expo put on by M.A.C.E. last month. Things like how much does it cost? and where is it available? and can we get the company to come by and demonstrate it some time? Good luck Ted!

A motion from the floor and presented by Jerry Monroe, opened a discussion on the merits of lending support to A.U.A., the Atari Users' Association. (See related article in the last issue of AIM, pg. 22.) After everyone had a chance to express themselves, the original motion was seconded and passed. Steve Volker volunteered to contact them and report next month.

And Finally... How well have we weathered the storm? Through chip shortages, vaporware, shrinking software support, and the 'foreignization' of Atari, yet still we have endured, and long enough to see the other end of the tunnel. A hearty CONGRATULATIONS! to all of us, we've shown our mettle.

But NOW is not the time to sit on our laurels, it is time to secure a few footholds. We now have an Atari Corporation which finally fulfills it's promises, a great influx of new European software titles appearing, a growing voice through the Atari Users' Association, TWO local computer dealers willing to support us, an upcoming Atari-specific computer expo, and a powerful and exciting computer in our homes and offices. Now is the time to add to our numbers and share our secrets. Bring a friend to the next meeting! Post a notice! Tell somebody where you spend your Saturdays! Volunteer!.. Let's get T.A.G. growing again!!...

...Nuff' Said...

Equipment Volunteers for July:

Wayne Fenior Mega 2 Steve Volker Monochrome Monitor

Ted Beauchamp 8Bit computer and drive Jerry Reno 8Bit monitor

Remember, if you're bringing equipment, please bring all the necessary cables (i.e. power cords, monitor cords, mouse, or whatever.)

The June meeting was called to order at 7:30pm by President Jon Brode. Jon edited his usual "Hear yea! Hear yea!" such that it came out sounding more like "Listen up, Kiddies!" Jon was in top form as he eventually got around to announcing that this meeting would be the annual Election/Flea Market night. In what turned out to be one of the most entertaining meetings of the year, the members elected the following persons to the Executive Board for the '89-'90 term:

Craig Harvey, President
Rick Shraeder, Vice President
Mike Olin, Recording Secretary
Dick Selke, Treasurer/Membership
Mike Millage, 8Bit Librarian
Russ Crum, ST Librarian
Paul Walkowski&David Brzezinski, joint Newsletter Editors

Paul was nominated for the Editor position, and agreed to accept on the basis that someone else could fill in for him on the nights he could not attend the meetings. David was nominated and accepted according to the same stipulation, so the members were polled for agreement to accept TWO persons for one office. Upon consent of the membership, both were elected to the position.

The remainder of the evening was left to run its course as members bought, sold, traded, and/or otherwise swapped excess goodies amongst themselves. Most of the hardware and software was for the XL/XEs.

The next meeting will be held on July 11 in the Wolverine Room of the Michigan Union. The feature topic will be MIDI/Music, and we'll have plenty of musical hardware on hand.

Congratulations to the newly elected officers, and Bon Voyage to the ones departing.

From the Treasurer

First, I would like to thank everyone who attended the June meeting and unanimously elected me to a second term.

Now to business. Larry Mumford is our new member for May; David Garland and Steve Filler renewed their memberships.

We didn't do as well as expected at the MACExpo and could have used more help at the booth on Sunday.

Remember, if you would like to join our group or renew, please make your $15 check or money order payable to:

Dick Selke,
31139 Cooley Dr.
Westland, MI 48185

See you at the meetings..

Mouse Balls

Submitted by Bob Retelle

[This text ACTUALLY came out of an IBM service database. Of course it's referring to the rubber ball inside a computer mouse...]

Abstract: MOUSE BALLS NOW AVAILABLE AS FRU (Field Replacement Unit)

TEXT: MOUSE BALLS ARE NOW AVAILABLE AS A FRU. IF A MOUSE FAILS TO OPERATE, OR SHOULD PERFORM ERRATICALLY, IT MAY BE IN NEED OF BALL REPLACEMENT. BECAUSE OF THE DELICATE NATURE OF THIS PROCEDURE, REPLACEMENT OF MOUSE BALLS SHOULD BE ATTEMPTED BY TRAINED PERSONNEL ONLY.

BEFORE ORDERING, DETERMINE TYPE OF MOUSE BALLS REQUIRED BY EXAMINING THE UNDERSIDE OF EACH MOUSE. DOMESTIC BALLS WILL BE LARGER AND HARDER THAN FOREIGN BALLS. BALL REMOVAL PROCEDURES DIFFER, DEPENDING UPON MANUFACTURER OF THE MOUSE. FOREIGN BALLS CAN BE REPLACED USING THE POP-OFF METHOD, AND DOMESTIC BALLS REPLACED USING THE TWIST-OFF METHOD. MOUSE BALLS ARE NOT USUALLY STATIC SENSITIVE, HOWEVER, EXCESSIVE HANDLING CAN RESULT IN SUDDEN DISCHARGE.

UPON COMPLETION OF BALL REPLACEMENT, THE MOUSE MAY BE USED IMMEDIATELY.

IT IS RECOMMENDED THAT EACH SERVICER HAVE A PAIR OF BALLS FOR MAINTAINING OPTIMUM CUSTOMER SATISFACTION, AND THAT ANY CUSTOMER MISSING HIS BALLS SHOULD SUSPECT LOCAL PERSONNEL OF REMOVING THESE NECESSARY FUNCTIONAL ITEMS.

P/N33F8462 — DOMESTIC MOUSE BALLS
P/N33F8461 — FOREIGN MOUSE BALLS

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

ST
PROTECTION
TECHNIQUES

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) Only **$39.95**

DigiSound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

Is It a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only **$39.95**

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only **$39.95**

Polydisk

Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

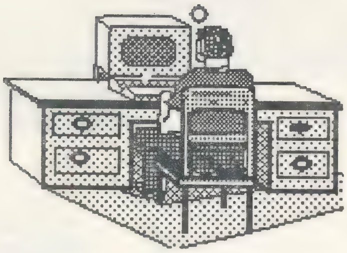
AIM is produced with a 2.5 meg Atari ST, HP LaserJet II, Timeworks' Publisher ST, PageStream, and Migraph's Easy-Draw

Atari Interface Magazine is a monthly magazine that also serves as the official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. A subscription to AIM is included in membership in any participating club or may be purchased directly from Unicorn Publications. For advertising or user group discount subscription rates, please call (313) 973-8825.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIMand the author (and club if applicable). Opinions expressed within articles in AIM are solely the views and responsibility of the authors and do not necessarily represent the opinions of AIM or of any participating group. Atari, the Fuji symbol and names of various Atari computer products are trademarks of Atari Corp.



Editorial Ramblings

In the wake of the recent World of Atari (WOA) show and the clash between that show and a local Michigan user group AtariFest, we feel it is important that all user groups planning to host their own shows or to invite ST World to produce a show should consider carefully what happened in Michigan.

During the course of planning for the MACE-sponsored AtariFest, there were apparent attempts made by Rich Tsukiji of ST World, and/or his show coordinators, to scuttle the MACE show. The most upsetting of these apparent attempts implied that MACE officers were, in essense, blackmailing Atari into supporting the MACE show and dropping support for the WOA show. According to John Nagy, the user group coordinator for the World of Atari show, he received a call from Rich Tsukiji in which Rich said that Pattie Rayl, MACE show coordinator, had spoken with Sig Hartmann and Sam Tramiel. Rich Tsukiji stated that this information had been passed on to him by Sig Hartmann. According to John Nagy, Mr. Tsukiji said Pattie had told Atari that all the other Michigan user groups preferred that Atari support the MACE show over the WOA show, and if Atari did not comply, they would be shown to the public as not being supportive of user groups. Mr. Tsukiji concluded by requesting that John contact the clubs and have them get in touch with Atari to let their side be known.

Without contacting MACE to verify any of this entirely fabricated story, John Nagy contacted the four clubs involved in the WOA show and the fireworks began to fly. Letters, phone calls and FAXes to Atari and a few online outbursts on GEnie nearly killed Atari support for both shows. In attempting to sort out the whole mess, we talked at length with Sig Hartmann. Mr. Hartmann was highly upset over the entire thing and denied fervently that he had ever said any such thing to Mr. Tsukiji. Sig suggested that we organize a conference call, at Atari's expense, to get Mr. Tsukiji and the involved club presidents together to iron out the problems.

We contacted Mr. Tsukiji to schedule the meeting, but we were told by him that he didn't have time for such nonsense. After this conversation, we immediately called Sig Hartmann to see if he could convince Mr. Tsukiji to attend, and we were informed that Sig was speaking to Mr. Tsukiji on the phone at that very moment. We waited, and when Sig finally spoke to us, we were told by Sig that the whole conference call meeting was a bad idea and should be dropped.

Rich Tsukiji has stated that he plans for ST World to be the ONLY Atari show producers by the end of 1990. It seems he may attempt to meet this goal no matter what the cost to the user groups.

Another thing for clubs to ponder is the fact that ST World did not contact the vast majority of Michigan user groups to invite them to participate in the show in any fashion.

Even if all that changes and Mr. Tsukiji begins to deal fairly and honestly with all clubs in an area where a show is planned, there is still another major concern that all user groups should have. There was virtually no advertising done for the recent Dearborn WOA show. According to Rich Tsukiji, Atari did not come through with the advance money needed to pay for advertising. From this, one must interpret that the WOA shows are just as dependent upon advance money and help from Atari as the club-produced AtariFests. Also, the local clubs participating in the show were told that ST World would handle regional and national advertising, but all Michigan area advertising would have to be done by the clubs (apparently at the clubs' expense). Why should any user groups take on the basic responsibilities of producing, manning and advertising a show for a "professional promoter" who takes all the show profits? Why should user groups put their faith in a promoter who is dependent upon Atari for up-front money to properly produce the show?

We urge any user group weighing the choice between producing their own AtariFest or inviting ST World to hold a show to seriously consider these questions.

Bill & Pattie Rayl

Enhance your publishing power.

Migraph Hand Scanner.

Add scanned graphics to all your projects quickly and easily with the Migraph Hand Scanner.

The Hand Scanner provides a scanning window over 4″ wide with four scanning resolutions: 100, 200, and true 300 and 400 dots per inch. It also offers adjustable contrast, three dither settings for scanning halftones, and a special setting for line art.

Build your own library of images. Logos, photographs, books, illustrations . . . provide you with an unlimited supply of art.

Touch-Up,™ Migraph's high resolution image editor, lets you scan *and* edit your images. Powerful editing tools include crop, invert, resize, flip, cut and paste, multiple zoom levels, a full array of paint tools, and much more.

When your images are "pixel perfect", import them into your favorite ST publishing programs like Calamus, Fleet Street, PageStream, and Publisher ST. In addition, several save formats let you use your images on the PC and Mac.

The Migraph Hand Scanner and Touch-Up. Powerful tools for professional publishing.

For all Atari ST and Mega systems with monochrome or color monitors, 1MB memory and 3.5″ DS disk drive.

See your dealer today for more details or call us direct. Dealer inquiries invited.

Atari News and Comment

by Bill and Pattie Rayl

Atari Corp. News

The long awaited AtariWriter+ 80 is now available, but initial reactions from users of the word processor are that it just wasn't worth the wait and certainly isn't worth the price.

Of course, if you love AtariWriter+ and have an XEP80, you'll probably want to form your own opinion! AtariWriter+ 80 is available from your local 8bit dealer, if you're lucky enough to have one.

Innovative Concepts of Warren, MI, has AtariWriter+ 80 in stock for $49.95 and you can mail order it, and other fine 8bit products, from them. If interested, contact Innovative Concepts, 31172 Shawn Drive, Warren, MI 48093, (313) 293-0730.

Developer Kits

If you're an ST programmer and you've been wondering how to become a registered developer, look no further!

There are actually two different classifications for registered developers. For those who just want to get the documention in the developer's kit, Atari will sell the documentation for $112.50.

If you want the documentation, Atari technical telephone support, access to the private "developer's areas" on the major online services and special hardware discounts, the price is $237. And, for an extra $63 ($300 total), you get all of the above and a copy of Mark Williams C (a $179 retail value).

All California residents must add 7% sales tax to the above prices. All payments should be made by cashier's check or money order made out to Atari Corporation and sent to Atari Corporation, 1196 Borregas Ave., Sunnyvale, CA 94086, Attn: Gail Johnson/Developer Coordinator. If you would like more information about becoming a registered developer or about the developer's kit, contact Ms. Johnson at (408) 745-2568.

TOS 1.4

The "final version" of TOS 1.4 is reportedly in the hands of registered developers in PROM form. Indications from Sunnyvale are the new ROMs will be available at your local Atari dealers by late fall.

Meanwhile, online reports from users of the "final" version indicated that Atari had removed RS232 Flow Control from the PROMs sent to developers. Atari officials confirmed the reports and said that Flow Control would be "put back in" for the public release of TOS 1.4. Some resourceful hackers have said that Atari merely "blocked" Flow Control in this latest release, and ways have already been found to "remove" the block.

Upcoming Atari Shows

The Washington Area Atari Computer Enthusiasts (the clubs that collectively participate in Current Notes) are co-sponsoring ATARIFEST '89 on October 7 and 8 at the Fairfax High School.

Billed as "COMDEX for the Common Man," the show is open to all and admission is FREE. For more information, see the ATARIFEST '89 press release elsewhere in this issue or call Charles Smeton, WAACE Vice Chairman at (301) 465-8628.

The next stop for the World of Atari (WOA) show, sponsored by ST World magazine, will be at the Holiday Inn Holidome in Dallas, TX, on August 19 and 20. Although no official announcement has been made as to what exhibitors will be attending this third WOA show, a number of developers at the recent Dearborn WOA show indicated they would not be attending.

Developers like Gribnif and SofTrek said the $650 a booth price was a bit too steep for them, while others indicated that a show every other month is just too much and doesn't allow for enough time to properly advertise the shows.

It is also unknown at this time if Avant Garde, STart/Antic, Timeworks and ISD (all no-shows at the Dearborn WOA) will be coming to the Dallas show. The show will only be days away as you read this, and more concrete information should be available by then. For more up-to-date info, call ST World at (503) 673-2259.

The possibility of a Seattle WOA show this year has apparently hit a snag. According to Jim Chapman, Vice President of S*P*A*C*E and PSAN coordinator, "the as-yet uncertain availability of a suitable site" to hold the show may mean no show until early 1990. Meanwhile, Michigan area Atarians have been promised that the WOA show will be once again swinging their way in May of 1990.

New Releases

Orion MicroSystems has begun shipping Keith Ledbetter's new Express! cartridge-based terminal program for the XL/XE. The cartridge has been generating some very favorable responses from online users and sells for $69.95. For more information, contact Orion MicroSystems, 2211 Planters Row Dr., Midlothian, VA 23113.

Not to be outdone, Bob Puff has released version 1.10 of BobTerm, considered by some to be the very best overall terminal package ever written for the Atari 8bit computer. The new version now has 80-column support using Atari's XEP80 adapter. BobTerm is available from the online services or, most likely, from your local user group or BBS. Remember to support the Shareware concept — if you use the program, send in a donation. The Atari 8bit community needs programmers like Bob Puff, and your donation really does make a difference!

Regent Software is has released a function key labeling program called FUNCTIONZ. Consisting of a special label maker program, six clear plastic label stands and a collection of predefined function key labels, the package costs $24.95. The program is GEM-based with built-in help and is "guaranteed not to crash or bomb." An additional 8 plastic label stands are available for only $13.95. (Add $3 US, $5 foreign when ordering directly from Regent Software.) A demo version of the FUNCTIONZ software is available on CompuServe in Library 6 of the Atari Vendors Forum (GO ATARIVEN) and on GEnie and Delphi. For more information on FUNCTIONZ, contact Regent Software, PO Box 14628, Long Beach, CA 90803, (213) 439-9664.

In the Local Area Network (LAN) market, the ST has long been lacking a solid, inexpensive package that would allow multiple STs to be linked together and share resources. Now, Lantech Systems has released a 10 megabit-per-second LAN for the low price of only $179 per port (hardware and software included). Each ST hooked up to the Lantech LAN requires a card that plugs into the ST cartridge port, standard 50- to 75-ohm cable, BNC Couplers and connectors readily available at any electronics store. The LAN is totally transparent to TOS and GEM and is fully configurable to each user's needs. The Lantech LAN will function with a minimum of two STs connected, and the maximum number of connected systems is limited only by the frequency and duration of disk accesses. For details or dealer inquiries, contact Lantech Systems, PO Box R, Billerica, MA 01821, (508) 667-9191.

Abacus Software, a long time supporter of the ST, has recently released BeckerCAD ST. A "Professional Level" 2D Computer Aided Design package, BeckerCAD comes with a built-in programming language for modeling intricate objects and object manipulation. The software also supports Postscript, HPGL and GDOS output and requires at least 1 Meg of RAM to run. Arnie Lee, president of Abacus Software, reports that "Early users have commented how easy BeckerCAD is to learn to use. But, they've also been impressed at the extent and depth of the design tools that are part of BeckerCAD." BeckerCAD is available now at a suggested retail price of $395. For more information, contact Abacus Software, 5370 52nd St. S.E., Grand Rapids, MI 49512, (616) 698-0330.

Turbo-Info #2

Where is All of My Memory?

by Chuck Steinman (DataQue)

This is the second part of a multi-part information article on the Turbo-816 from DataQue Software, for the Atari XL/XE computers. The first installment went over the basic system, and this article will explain the various possible types of available memory in a Turbo-816 upgraded system.

Because of the limited addressing range of the 6502 CPU used in the Atari 8bit computers, there have been several techniques used to allow larger programs and more data to be stored. None of these techniques used to date have been efficient, and most are awkward at best.

The Turbo-816 changes all of that. Because of a lack of definition in the past of the various ways of describing the many ways the 6502 can address memory, I have made my own definitions as to how the 6502 and Turbo-816 can address memory. I have broken memory down into several basic groups.

Standard

This is the original 64K of memory that the 6502 can directly access without any gymnastics. In most systems, there would be a 16K section dedicated to the ROM space and I/O devices, and the remaining 48K is available for either RAM or cartridges.

Extended

This is the RAM that is available by using a bank selecting technique like the Atari 130XE. Many have upgraded their XL computers to also have a compatible bank selected RAM area. The Turbo-OS includes several routines to manage and report the amount of Extended RAM available. The Extended RAM is used and available exactly like it always has been, so your programs that use the XE banked RAM will still work just fine.

Explicit

This is a 1 megabyte area for RAM or ROM which is installed by using Turbo-SRAM cards. It can be any mix of either Static RAMs or PROMS. The Turbo-SRAM card is compatible with many common sizes of RAMs and EPROMS.

The Turbo-OS checks the Explicit range from $010000 to $07FFFF every 32K for a pattern, to detect whether either ROM or RAM exists. The reason for dedicating an area for SRAMs and EPROMs was to allow for resident programs to be held in either EPROM, or RAM, and for those programs to optionally also have their own dedicated data RAM.

This would allow you to have several different application programs or device drivers installed in the system, and select from those programs without having to load them from a disk file or insert a cartridge. They would normally be dormant, and would be activated by a system call.

There are several operating system functions which support the Explicit memory. There are routines to allocate and deallocate Explicit RAM. There are also routines to Initialize and Execute application programs that reside in the Explicit memory range.

Expanded

This is an 8 megabyte area dedicated for use by user applications as either data or program RAM.

The Turbo-OS will scan the range of $080000 to $7FFFFF to determine how much Expanded RAM exists in a particular system. Also, the RAM can be allocated in 256 byte blocks by applications. This will allow for multiple applications to share the available RAM. There is also a deallocation routine to return allocated RAM back to the system.

Proto

This is an area defined for the prototyping card, which is available for any user developed applications. No production product should ever use this area. This two megabyte area runs from $800000 to $9FFFFF and is not checked, or used, by the Turbo-OS.

Video

There is a 4 megabyte range of memory dedicated for video adapters, in the range of $A00000 to $DFFFFF. This will allow for multiple video adapters to have their own RAM, without conflict. Also, this RAM is specified as dual-port DRAM, so unlike the ANTIC video RAM, no bus arbitration or DMA is required to access the RAM, either by the CPU or Video controller.

This allows the CPU to run though video refreshes, unlike the current system in which ANTIC halts the CPU while it is reading the video RAM out to the shift registers.

DataQue

This is an area defined for in-house applications and products, and should not be used by any third party or user products. This one megabyte area runs from $E00000 to $EFFFFF and is not currently checked, or used, by the Turbo-OS.

Turbio

This block is reserved for Input/Output (I/O) devices and control registers. It is located from $F00000 to $FFFFFF and can be used by various peripheral cards. There are specific ranges within this spec for certain devices.

At this time, the only device that uses this area is the 80-column video adapter. Other peripherals such as disk controllers, printer interfaces and co-processors would use this area for their access, to allow for maximum compatibility. Each peripheral and its supporting device driver should allow for several different locations, to allow for co-existence with other peripherals and also multiples of like peripherals.

How much is YOUR time worth?

Turbo ST turns your 520/1040 ST into a speed demon. Check out **Turbo ST** at your local dealer or download our free demo from your favorite bulletin board.

Upgrades to version 1.6 are only $5 with your original disk. For more information, call (407) 657-4611, or write to SofTrek, P.O. Box 5257, Winter Park, FL 32793.

Press Release

New Support Club For ST User Groups!

Tucson, AZ. Practical Solutions has initiated a new program, the Atari Computer Enthusiasts (ACE) Support Club, for all Atari ST user Groups. The ACE Support Club allows User Groups to obtain one free copy of each Practical Solutions' product for a one-time membership fee.

Here's how it works: A group wishing to join sends a Letter of Application, signed by an Officer of the User Group, along with a check or money order for $25 and a request for their first product (only one at a time can be requested). The product of their choice is sent FREE and becomes the property of the User Group. The User Group then presents the item at a regular group meeting and subsequently reviews it in their newsletter.

When the group is ready to receive their next product, they simply send in a copy of their newsletter where the review appeared with their next choice. Their Practical Solutions' product selection is then sent, again free of charge! ACE Suppport Club membership limits a User Group to one free copy of each product.

Practical Solutions has always received support from User Groups and we feel that this is a way to show our appreciation for their enthusiasm. The ACE Support Club gives us a chance to become more involved with User Groups whose existence is vital to the Atari ST community. Their members direct feedback is also immensely valuable in aiding the direction of all of our products and services.

Letters of application and inquires can be sent to:
Practical Solutions, Inc.
Attn: ACE Support Club Coordinator
1135 N. Jones Blvd.
Tucson, AZ 85716
Phone: (602) 322-6100

Dearborn World of Atari Show Report

by Patricia Snyder-Rayl

Many Atarians in Michigan were scratching their heads in puzzlement earlier in the year when ST World's Rich Tsukiji announced he would be holding a show only six weeks after the show date already announced by MACE.

Both shows have now come and gone, and some users are still scratching their heads, wondering why there was no advertising done for the Dearborn World of Atari (WOA) show and why the show didn't live up to its promotional promises.

According to Rich Tsukiji, Atari did not come through with promised pre-show funds for advertising and that is why no advertising was done. Reportedly, Atari was supposed to advance $10,000 to help in advertising for the Dearborn WOA show.

When Jerry Cross, president of the Genesee Atari Group, was told that no promotional material had been sent to any user groups, he took it upon himself to mail flyers to clubs in the region — just two weeks before the show. At the show, Atari's Chris Roberts said that Atari had indeed given Mr. Tsukiji advance money, and in return they were given more booth space at the show than Atari had paid for.

Regardless of what the truth is, no local or regional advertising was done to reach the general public. Pre-show publicity projected that around 6,000 people would be attending the show. Probably due to lack of advertising, the number of attendees never even came close to the projection.

ST World stated "official" attendance for the Dearborn show was 3,100 but other exhibitors placed the attendance figures at closer to 2,000. Some attendees commented to me about the emptyness of the show, and it did seem many times on Saturday that there were more vendors at their booths than show attendees.

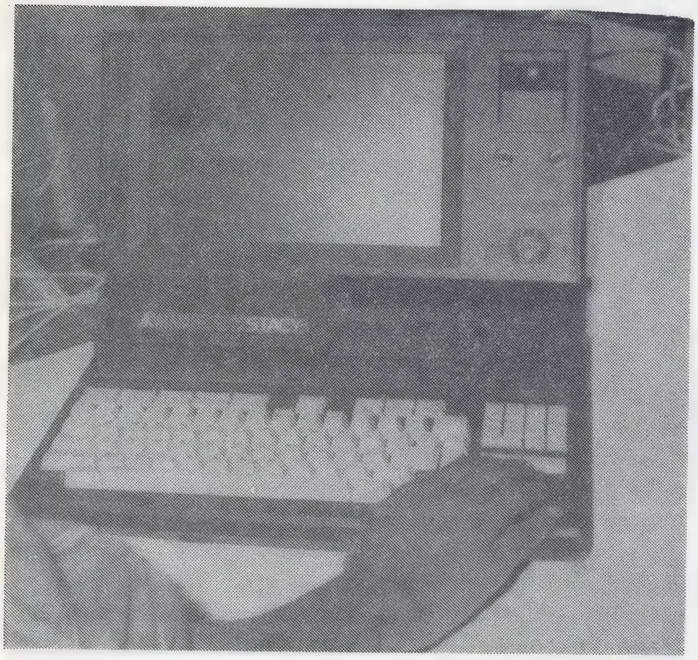
Atari Corp's Chris Roberts

Those Atarians that did attend were satisfied with the show, but many were a bit disappointed that the show did not live up to their expectations. One attendee told us he was glad he purchased his tickets in advance from his user group, because he would have been upset had he paid full price for admission.

Atari was at the show, though not in full force as was stated in online show announcements. The pre-show promotional information stated that 15-20 Atari representatives would be attending the show. This figure was, to put it mildly, inaccurate. In fact, only Sig Hartmann and Chris Roberts, Atari's new user group coordinator, came from Atari US to support the show.

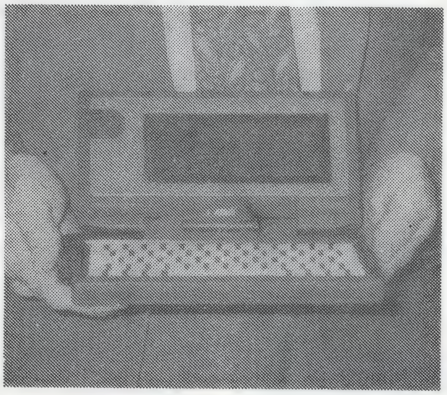
Rick Flashman of Gribnif Software had posted a message on GEnie just prior to the show that he had been told Atari would not be sending representatives to the show. He had been told, by an executive-level source within Atari that Atari was disappointed in the previous Anaheim show and that some Atari equipment had been damaged and stolen at the show. Perhaps this is why Atari only sent Sig Hartmann and Chris Roberts, but we may never know.

Atari had two large booth areas, one for the ST products and one for the 8bit. Though noone from Atari manned the 8bit booth, attendees were free to play with the items on display there. Those included the 8bit version of Midi-Maze, the popular multi-player ST game and the long awaited AtariWriter+ 80 wordprocessor hooked up to a monitor with a less than pleasing display. In fact, an attendee



The STacey

of the show had typed into the wordprocessor what he though of the monitor...and that message remained onscreen for a good part of the day!



Atari's Portfolio

On the ST side, Atari was showing some new Bentley Bear educational software, the MegaFile 44 removable cartridge hard drive, the STacy laptop, WordFlair and the Portfolio VCR-tape-sized IBM compatible.

When Chris Roberts was asked if Atari had any press releases on WordFlair, an integrated spreedsheet/ database/wordprocessing package that uses GDOS, he said the program isn't yet far enough along in development for that. He further indicated that people at Atari are "still playing with it."

AIM Editor Bill Rayl decided to follow their lead and did a little playing with WordFlair himself...and the program locked up within seconds. Looks like it will be some time before we see this software hit the market...hopefully!

The STacy laptop was at the show, and it was working beautifully thanks to a miracle performed by David Small. It seems the STacy was dropped and "sorta smashed into a thousand pieces," according to one observer who saw the STacy before Dave operated on it.

According to Dave Small, "We had to put STacy back together. We were up until 5 a.m. and the inside of it is full of duct tape and it's all wired down."

Dave said they had to raid a local convenience store to get "all kinds of glue" to put the machine back together. "It was pretty bad seeing the only STacy laying in a box in pieces," he said.

Atari's new Portable Color Entertainment System and ABC 286 IBM-clone were not at the show, contrary to pre-show announcements. The Dearborn WOA show also had a number of well-known and respected exhibitors showing their stuff.

Gadgets was showing off their Spectre GCR, but didn't have any units for sale. David Small was more than happy to talk about and demo the Macintosh emulator and there was a sign-up sheet for people wanting to be contacted when the product was ready to ship.

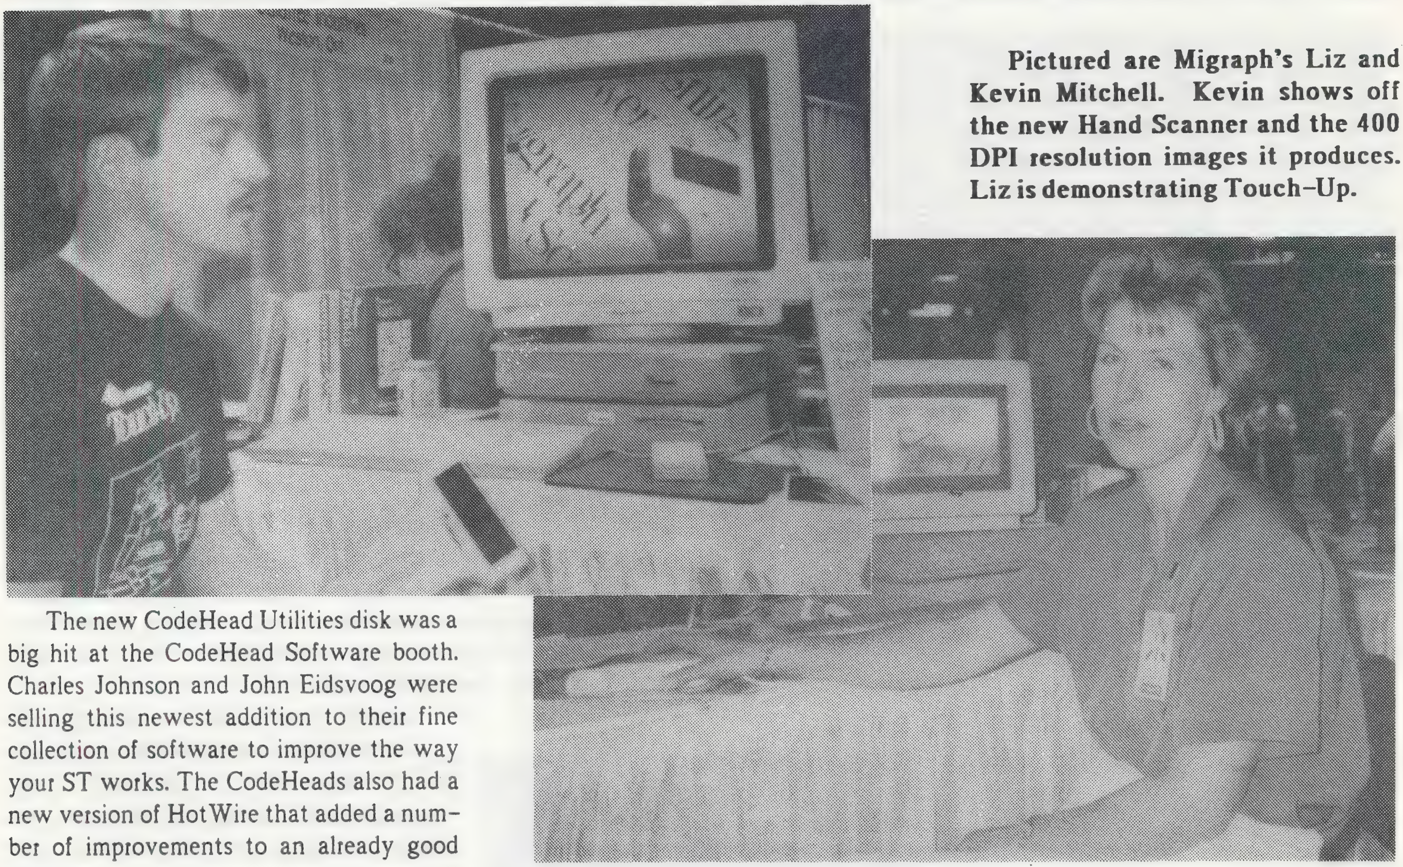
Liz and Kevin Mitchell of Migraph were proudly displaying their new Hand Scanner and Touch-Up. The demonstration given by Kevin Mitchell, using the Hand Scanner to scan in black-and-white and color originals at 300 and 400 dpi, was impressive to say the least.

Abacus was displaying their complete line of Atari computer books and showing off their new CAD program BeckerCAD. MichTron had a large, centrally-located booth where they were showing all their available software.

Alpha Systems was there with their impressive hardware and software products for the 8bit and ST computers. George Morrison was showing off their new Jam Master, an ST program that can turn your low-end Casio keyboard into a powerful MIDI synthesizer.

SofTrek had a new version of TurboST and they were giving FREE upgrades to show attendees that brought their original disks to the show. They were also showing their soon-to-be-released super-fast TurboST upgrade that speeds up GEM functions to a phenominal rate.

8Bit MIDI Maze



Pictured are Migraph's Liz and Kevin Mitchell. Kevin shows off the new Hand Scanner and the 400 DPI resolution images it produces. Liz is demonstrating Touch-Up.

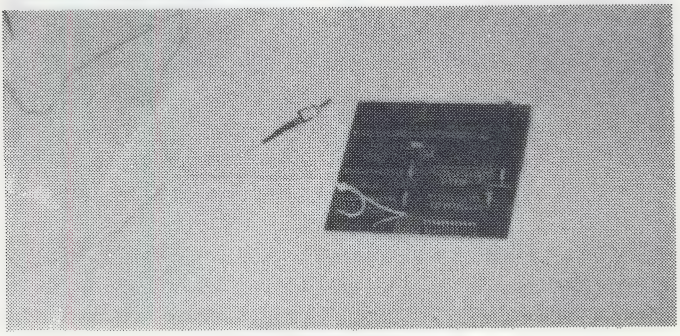
The new CodeHead Utilities disk was a big hit at the CodeHead Software booth. Charles Johnson and John Eidsvoog were selling this newest addition to their fine collection of software to improve the way your ST works. The CodeHeads also had a new version of HotWire that added a number of improvements to an already good program.

ICD was at the show and they were selling their popular FaST hard drives at a very tempting price. In fact, by the middle of the first day, ICD had even sold their demo model. Gribnif Software was showing attendees the wonders of NeoDesk, the replacement desktop for the ST.

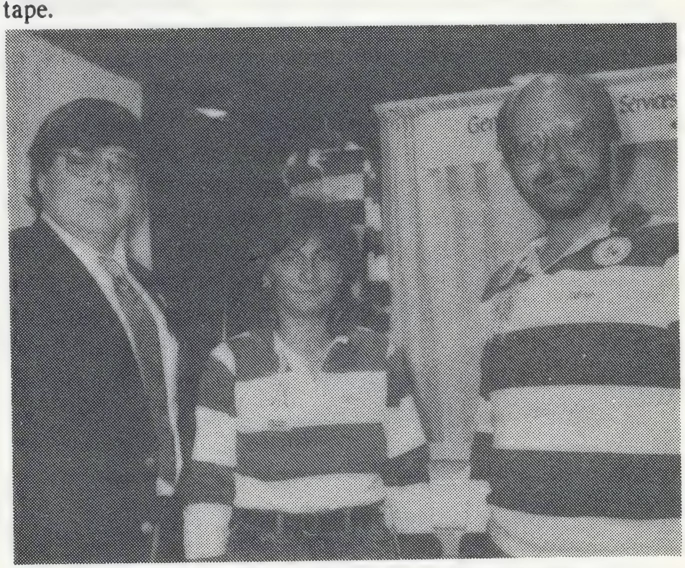
Problems with the phone line at the InterSect booth prevented demonstration of the InterLink terminal program to showgoers. Both InterLink and Revolver were on sale at the booth, but the eagerly awaited MasterLink terminal program was not available for purchase or demonstration.

Jim Allen of FaST Technologies was showing off his 16mHz accelerator board for the ST. Jim was very willing to talk about his product and allowed people to test the board's performance for themselves by comparing an ST with the accelerator to another ST without it. This side-by-side comparison, using benchmarking programs, was quite nice. Jim even brought out his prototype board for us to snap a picture (elsewhere on this page).

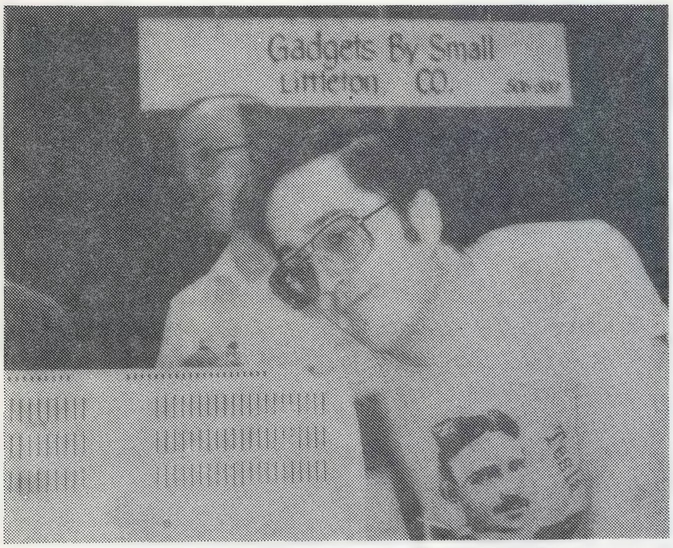
DataFree of Canada was also at the show with their own 16mHz accelerator, giving show attendees the opportunity to see and compare these two products. Seymor Radix had their well-known IMG Scan product and their new DTV hard drive backup hardware/software that backs up your hard drive to VCR tape.



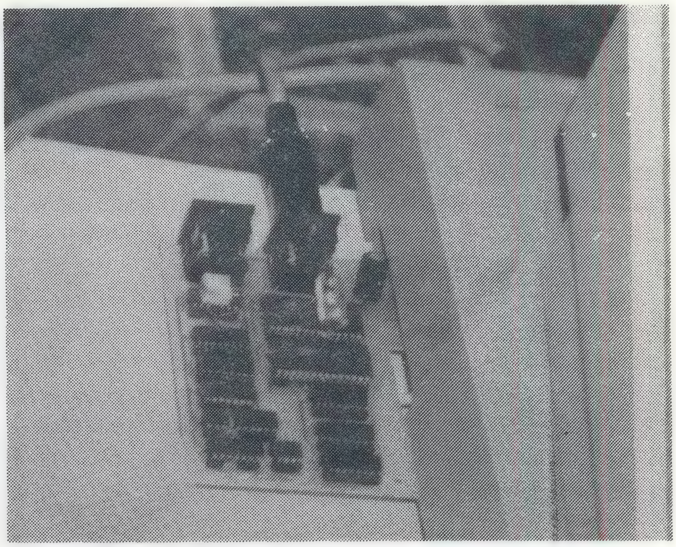
The Turbo16 board



GEnie Sysops Craig Thom(left), Darlah Pine and Jeff Williams (right).



Dave Small



A look at the Spectre GCR

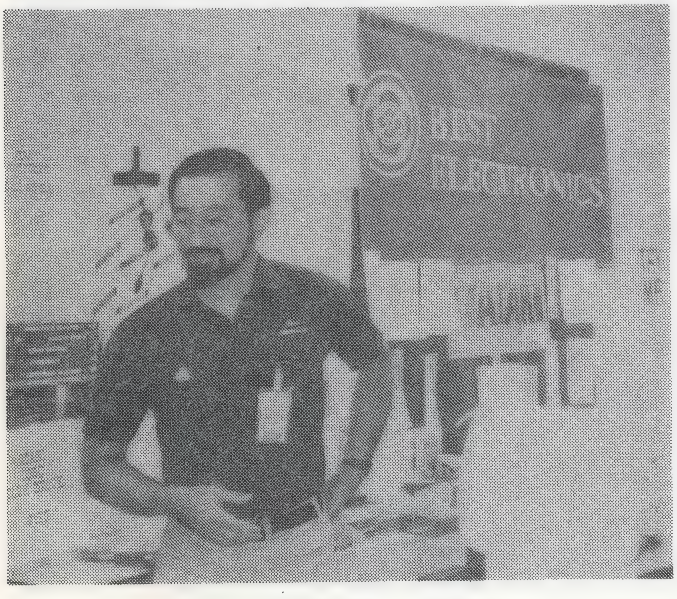
Alan Reeve of Reeve Software had the Diamond cartridge for the 8bit Atari on display and for sale. He also had Diamond Paint, Diamond Write and Diamond Publish at the show. Having "parted ways" with USA Media, Alan has pushed on with his product and Diamond is looking good! Also behind the Reeve Software booth was a running demonstration of JRI's GenLock. Showing a rotating 3-D CAD image, GenLock looked impressive.

Other exhibitors at the show included BEST Electronics, Innovative Concepts, Imagen, GEnie and Sierra On-Line. Dealers included mail-order and local stores like First Stop, Rite Way, Mars Merchandising and Cal Com.

Companies that had been announced as attending that did not show included Timeworks, Antic/STart, ISD and, the biggest disappointment of all, Avant Garde. A number of show attendees indicated that they had come to the show for the express purpose of seeing the new pc ditto II.

There were nine seminars scheduled over the two days, six on Saturday and only three on Sunday. These seminars included talks by Sig Hartmann of Atari Corp., Dave Small on the Spectre GCR, Alan Reeve discussing 8bit graphic operating environments, Jim Allen talking about his company's accelerator board, Darek Mihocka on his new Quick ST shareware, Dorothy Brumleve on Computers and Kids, and two seminars by MichTron's George Miller (one on HiSoft BASIC and one on desktop publishing).

A number of the seminars were scheduled at times that directly conflicted with other seminars, forcing showgoers to make a choice in which talks to attend. Tom Harker's seminar on hard drives was cancelled because he did not accompany the rest of



Brad of BEST Electronics

MichTron's founder, Gordon Monnier

Sierra-On-Line was proudly showing off new releases for the Atari Line of computers.

ICD's representatives to Dearborn, and the National User Group Forum seminar "just never got off the ground."

The local clubs that were invited to participate in the show included MAGIC (Warren, MI), GAG (Flint, MI) and GLASS (Troy, MI), the three clubs that together sponsored the successful Detroit MAGIC show, and CHAOS from Lansing, MI. These clubs were given booth space in return for their work in promoting and staffing the show.

Overall, the impression of the Dearborn show was that it was, despite its shortcomings, a good show. Certaintly, for being billed as a "professionally produced" show with more to offer Atarians than user group sponsored AtariFests, the Dearborn WOA show fell far short of being a resounding success.

In comparing the Dearborn World of Atari show to past AtariFests, user group produced shows like the Detroit MAGIC Show and Toronto Atari Convention were much better.

But, the Dearborn WOA show was not produced by user groups and should be held to a higher standard. After all, these guys are supposed to be professional show promoters.

Looking at the show as an affair put on by a company trying to make a name as a professional Atari show producer, the Dearborn WOA show failed to live up to its billing.

Having just finished planning an Atari show for MACE, I know how much work there is to putting on such an event. I also know how difficult it is for User Groups to sponsor AtariFests, since Atari doesn't support them as much as many Atarians would like. I understand how attractive the idea is to have an outside "professional" promotor sponsor a show.

Knowing all this, the Dearborn World of Atari show was a disappointment, and, if this show was an indication, Atari user groups may be much better off holding their own shows. The World of Atari show pales considerably when compared to many of the past and recent user group sponsored shows.

The next World of Atari show is scheduled for Dallas in mid-August, and Rich Tsukiji has stated there may be another World of Atari show here in Michigan in May of 1990. Let's hope he's learned a lot by then.

A look at UltraScript from Imagen

Populous

by Nabil Pike (PAK)

This article originally appeared in the COMPUTER NEWS, published by the Portland Atari Club and the Original Eugene Atari Computer Enthusiasts.

Populous is a new game from Bullfrog Software, a brilliant two-man team of programmers, who (if Populous is any indication) will have a promising future in the software industry.

In Populous, you play one of two deities (gods) who battle for control of your world. At first sight, this game looks like nothing more than a complex game of "Capture the Flag," but as you play, it is seen that the game is possesed of a much greater depth. You do not directly control your people, but rather help them in building and expanding. Your help is in the form of raising or lowering the land to facilitate the building and expansion of your people, and also to interfere with the progression of your enemies' building.

Along with this option is the ability to alter the world and events on an even larger scale by causing natural disasters such as earthquakes, swamps, volcanos and, most destructive, a flood that raises the level of water across the entire world. But, alas, all these miracles require progressively larger amounts of mana.

Mana is the spiritual power you draw from your followers. There are two methods I have found successful for gaining mana. The first is to gain mana by having a large amount of followers who produce a small amount individually. The second, and more efficient, method is to create larger flat areas of land for building. This allows your people to build larger and more sound settlements that produce people slower but create more mana.

Another factor that makes this game so versatile is its ability to vary options, such as terrain, worlds and available powers. If this isn't enough for you, you have the option of reediting the world or creating your own.

When you get tired of playing against the computer, you can always call up a friend and play by modem.

Overall, this game is an incredible value for the money and is a tribute to the high standard of software that is any computer user's inalienable right. So, all you would-be deities get out there — we have worlds to conquer.

Assignment: ShadowGate

by Steve Volker (TAG)

"Hi!" Aaron the Brave here, on current assignment at Castle ShadowGate. Actually, it's more like Aaron the Dead right now. You see, I've just died for the forty-seventh time since beginning this quest. (I was SURE that the 'David' thing would work on that 'Goliath' of a cyclops.) It's lucky us computer hero types are a hearty lot! Anyway, this gives me a chance to tell you a little about what I'm doing.

I had just finished up a job slaying a dragon and saving a princess, and I had had a bit too much victory celebrating and woke up with an empty purse. (Something about that word 'purse'...hmmm...) The only part of the posted edict I could be sure of was the large letters across the top...R E W A R D! (We heroes aren't usually big readers.)

I copied down the area code and number, and I soon found myself standing before the most high wizard, Lakmir, waiting my turn for an interview. One minute I stood behind three burly, foul-breathed barbarians, and the next Lakmir was waving his hands and speaking harkish sounds, and...well...here I am.

What do you think of this place? I personally like the cobbed and greenish skull above the entrance, it lends a certain sense of danger and...what the...Oh, O.K. It's time for me to go back in now. The enchantment called 'SAVING' is done, and my master is quite adamant about me ending the miserable life of the Warlock Lord as soon as possible, so...hey, why don't you come with me? Good, let's go!

We've been all through this area here; the hardest part of this was trying to find all the keys. This place has some of the hardest damn doors I've ever seen. I'm serious! If you don't have a key, you don't get through!

This has been one of the most enjoyable quests I have had in a long time. Almost everything can be EXAMINED and OPERATED to some purpose.

Oh, you need to use this for just about everything...it's one POWERFUL talisman with the unlikely name of 'mouse'. (Go figger' it!) Its enchantment allows you to examine the secrets of these ancient walls, probe for hidden passages and defend yourself against the many foul denizens which seem to be everywhere. It can even be used to look inward, to examine what you carry, or determine what condition you're presently in.

WATCH THIS HERE! Some of our comrades triggered a hidden mechanism and fell to their deaths as the floor fell away beneath them. Gods, but I fear to touch anything! Everything is enchanted, and little is as it first seems. At each door or dead end, or rubbled wall, you find you can go no furthur until the proper item, of the hundreds discarded everywhere abouts, is found and OPERATED correctly. Nay, this Warlock Lord is no fool!

There was some history known before we first entered here. A strange, single-sided block of rarest material bespoke of the creators of this thrice-cursed castle: ShadowGate.

Known only as ICOM Simulations, Inc., these great wizards, and those of the dark coven MINDSCAPE, did wrought this abomination for the purpose of entertainment! Why, the great wizard Lakmir himself had to acquire a most wonderous orb called a Color Monitor before even one of his power could perceive the runic messages found within. The Warlock Lord is no trifler.

We have found a number of scrolls and ancient writings in the most hidden of places. Some have yet to be translated, but of those we now understand, clues to our true quest and of the true powers of some of the items we now carry can be found, though most are of an abstract and symbolic rhyme.

Wait scribe! Hie yourself to a place of safety, quickly! For we are now approaching the arena of death where...Hold! Stop! You there! Do not toss your torch there! NO!! Gods! It lives again! ARghhhhhhhhhhhhhh...

[Editor's Note: The preceeding account was found written on a sheet of blood-stained parchment and tied to the handle of our office door when we opened this morning. We make no statement as to its true account.]

Karateka

by Bill Rayl

Over a year ago, Broderbund announced they would be porting Karateka, an action-oriented karate game, to the ST. The game has been eagerly awaited by many ST owners who punched and kicked their way through the 8bit Atari version. Now, Karateka is here for the ST.

In the game, the Princess Mariko has been kidnapped by the evil Lord Akuma and is held captive in his palace. You are a karateka, one trained in the art of karate. It is up to you to save the princess. To accomplish your mission, you'll need to defeat a dozen or so opponents in battles to the death, beat off an attack by Lord Akuma's pet hawk and finally face Lord Akuma himself.

One of the features that sets Karateka apart from the other games of this type is the almost cinematic way the game unfolds. The storyline is presented to you onscreen, as a parchment scrolls up your monitor. Then, the game begins as you reach the top of the cliff on which Lord Akuma's palace stands. Here, you meet your first opponent.

Once you have defeated the guard that is stationed at the cliff, the scene shifts to inside the palace. There, you see Lord Akuma ordering one of his men to take care of the disturbance on the cliff. The man bows to Lord Akuma and then leaves. The scene now switches back and forth between you and Lord Akuma's minion until you close for the fight.

The technique is very effective, and you are soon engrossed in the game. As you get closer and closer to accomplishing your mission, the cinematic feel of Karateka adds to the tension. When you first enter the palace, the scene shifts to Princess Mariko in her cell. She hears the disturbance and she raises her head to listen. Later, as you descend to the next level of the palace, the princess stands up in expectation of being freed.

But, setting the princess free is no easy task. As you progress in the game, Lord Akuma's minions get harder to beat, and their strength increases. You, on the other hand, grow fatigued and your strength decreases.

Each opponent you face must be defeated using only fist and foot. You can punch or kick in high, medium or low zone, using joystick or keyboard to control your movements. In Karateka, there are no fancy weapons, jump-spin-kick moves or back flips.

This simplicity of control makes Karateka seem more playable than many of the other karate/streetfight games. Instead of trying to remember some convoluted sequence used to accomplish a rolling summersault, you're busy kicking the butts of Akuma's minions.

Once you've defeated all the men Lord Akuma sends against you, the game really gets tough. Now, you must defend yourself against the beak and talons of Lord Akuma's trained hawk. Each time you don't succeed in punching or kicking the hawk, the bird will score a hit on you. A few hits and you're dead. If you're good enough and you defeat the bird, then Lord Akuma awaits in the next room.

Lord Akuma is, by far, the toughest opponent you face in the game. Aggressive and quick, he will take the initiative. If you defeat Akuma, Princess Mariko is yours; if you fail, there's always tomorrow...once your hand and your joystick recover from today's battles!

The graphics and sound effects in Karateka are quite good and complement the game very well. But, Karateka is probably not a game you will boot up to inspire awe and praise from your friends. On the other hand, Karateka probably won't end up on the shelf with the "awesome" games that look great but just aren't playable.

Tony Husband

'Wait for it!'

Tomahawk -- A Helicopter Simulation for the 8bit Atari

by Rich Link

I guess I tend to buy things by the "theme" method. When I get the yen for an adventure game, I end up with five! If I get hooked on a particular type of arcade game, suddenly there are 3 more boxes of the same type sitting beside it on the shelf. While some people might think that this is a silly way to buy software, it has its advantages. It's really easy to make comparisons when you have 'em all at once!

The latest "theme" seems to be based on the name "DATASOFT." After a period of not getting anything new (meaning not much available on the shelves), my eye was caught by a list of titles in the American Technivision ad in Antic. There were lots of Datasoft programs at prices of only $12.50. So I decided to give them a shot. Now it looks like I'll need to buy another shelf to put this stack of boxes on!

Datasoft has alway produced quality entertainment software. Their forte has been arcade games like Zorro, Conan and Saracen, and the Alternate Reality role playing series. Knowing how good their games are, I ordered Tomahawk figuring that it would probably at the least be entertaining.

Now, you have to realize that when it comes to flying, I have all the ability of an apteryx (a wingless bird with hairy feathers). I can usually get the plane off the ground, but getting it back is another story. I have played Flight Simulator II on several different systems, and they all work the same...when I land, I crash. So, can I do any better with a helicopter? Can pigs fly? Of couse not! But I can have lots of fun crashing this baby.

For someone with a basic grasp of the dynamics of airplane flight, helicopters take some getting used to. First of all, the controls are just similar enough to make you feel comfortable until you want to make it do something.

For example, I know helicopters can fly in a stationary position, but it just isn't that easy to get the thing to stop when you're cruising along at 160 mph. And you can roll a chopper over just like a plane, but then it has a tendency to accelerate in a downward direction... CRASH!

If it sounds like I didn't like it, you couldn't be further from the truth. I LOVE IT! The program seems to give you just the right amount of feel for flying these fixed wing beasties.

What about the rest of the game? First of all, this is an attack helicopter, which means that you are supposed to be shooting at something. You are flying over a 3-D terrain with trees, mountains and other features. It looks every bit as good as FS II. Along the way, you will be shooting tanks, buildings, artillery and even other aircraft. You have several weapons systems, from guns to Hellcat missiles.

There are four mission levels from which to choose, including flight training. You can have different scenarios with clouds, wind and day/night settings. For those of you who have the same novice stature as I, there are four pilot levels.

Flight control is via a combination of joystick and keyboard activity. As with most flight simulators, it is impossible to put all the controls on the stick, so things like activation of weapons, throttle, collective and rudder are accomplished by pressing keys. Memorizing the commands takes a bit of time, but there is a Quick Reference Guide included with all necessary commands and an explanation of the screen.

The game display is very nicely done, with a combination of bar gauges, digital readouts and icons showing the status of the craft. In addition, a quick tap of the "M" key brings up a map showing your position. A Doppler Navagation system shows your heading and tracks enemy craft.

Documentation is very complete, with a thorough explanation of the workings of the controls. In addition, there is an insert with the history of the Apache Attack helicopter and a background on helicopter aerodynamics. You can have fun and learn too.

The program came on an Atari/C-64 flippy disk, so you can run it on both your system and a friend's system (to impress him with your flying ability of course!). The game is extremely enjoyable and well done. A clear winner from DataSoft.

Night Hunter

by Perry Bailey (PAC)

This article originally appeared in the Computer News, published by the Portland Atari Club and the Original Eugene Atari Computer Enthusiasts.

You awaken suddenly. Your eyes fly open and you see nothing; you feel trapped, smothered. A surge of panic runs through you. Jerkily, your arms fly forward, snapping an obstruction out of your way and suddenly you can see. Bathed in the soft silver light of the moon, you inhale deeply the fragrance of the night.

Then it hits...the hunger boiling inside of you like fire coursing through your veins. Suddenly, all your senses become so acute that you can hear the rats running through the walls, you can smell the blood coursing through their bodies. You feel powerful, strong, unconquerable. Then you hear the sound of footsteps, and the hunger flares to a bright glow. "Humans, this night, I, Count Vladmir Dracula shall feed well!"

While Night Hunter doesn't quite start out this way, it probably should. This is a vampire game with a twist — instead of hunting down or running from the vampires, you are the vampire, the Night Hunter. This is one of the very few games in quite some time that has really gotten my interest. I think I have played Night Hunter recently more than any other game. Let me describe it to you.

The opening screen shows you, the vampire, standing beside a coffin. In the room with you, you will probably see rats running along the floor. (Ignore them; they are harmless. But, should a witch fly by, duck as she could zap you and drain your powers.)

At the bottom of the screen, there are two power indicators. The first one is appropriately red. This one is you power indicator and is replenished from the blood of your victims. (By the way, one thing I would like to mention is that in this game there is no such thing as an innocent victim — either you kill them, or they will kill you!)

The second gauge is blue and indicates your powers of transformation. After all, what kind of a vampire would you be if you couldn't turn into a bat! Night Hunter gives you the option of turning into a bat (a highly necessary function) or a werewolf-type creature.

According to the documentation (which is the weakest feature of this game) there are 30 levels to play and a total of 20 screens per level. If you don't think that is enough, then you haven't played this game! I am still trying to get past level 4 (if it weren't for them durn vultures I'd have made it last time!).

This is one tough game. There are a large number of foes to fight, from bowmen to priests to mad scientist types in the higher levels. The only foe you really ever have to run from is Van Helsing — he just has to throw a wooden stake in your direction and it is curtains, nothing left of you but a little pile of ashes.

One of the best features of this game is the clever use of sound effects, from the twang of an archer's bow to the sucking noises your vampire makes as he drains the life blood from his victims, leaving no more left of them than bones that crumble and tinkle musically together as they fall to the ground.

There are also all the sounds of the night, as well as the sounds and songs of the birds in the morning that herald the coming of day and the death of any vampire not hidden away in his crypt.

I am also very impressed with the graphics of this game. For example, as time passes during the night, you can keep track by watching the moon as it sails through the night sky...or the fine details of the characters on screen, like the vampire's red eyes...or the fact that the bowmen actually draw their bows before firing.

A great deal of detail went into this game's design, both from game play which is excellent (the joystick is quite responsive) to the great sound effects and graphics. I would rate this game very highly; I would say at least a 9. I would go higher, but there are a few gripes that I have with it, such as:

- There is no "Save Game" feature documented.
- On bootup, the game asks you for some kind of code, though the documentation doesn't explain anything about it. This is frustrating, for all I know the proper code letters could get me to some of those levels I only dream about seeing.
- Once again, the documentation (two pages) just doesn't seem to tell enough to do anyone any good.

As for my final conclusions, I think this game, while off beat, is a real winner and a good addition to anyone's library. The only thing I need now is a "trainer version" of the game so I'll live long enough to see all 30 levels!!!!

A Novice Fumbles Around the Keyboard or AtariWriter+ Explained for People Who Don't Want to Read the Book

by Jimmy Boyce (CACE)

[Editor's Note: This article is the first in a series to help XL/XE users of Atari-Writer+ get the most out of their word-processing endeavors.]

It shall be my endeavor to rewrite the book and explain (from personal experience) what this word-processor is all about. STUDENTS, this will interest you, because I have used this program exclusively for ALL OF MY HOMEWORK at Jackson Community College and the Jackson Area Career Center. For statistical work and charts I use B-Graph. That I will get into at a later date.

First of all, there is an interesting article in the July 1988 issue of ANTIC about the subject at hand. Secondly, I will be just sort of rambling through the handbook without any sort of order. Opinions about the various aspects of AW+ will be my own and not necessarily those of CACE.

I received my copy of Atariwriter+ (AW+) as a birthday present from a very dear friend. To that friend, I say THANKS A THOUSAND TIMES OVER. One of the nicest parts about this program is that the disk has versions for the 800, 800XL, 1200XL, and the 65XE on one side and for the 130XE on the other. For me this is super because I have an 800 and 130XE, so both computers are usable with AW+ and the spellchecker works for all of the aforementioned computers. If you put in the wrong side (if you don't have an 130XE), it reminds you of that fact with a little message.

I am not going to go through the methods of setting up your equipment and how to load a disk. I figure you have already done that, so lets assume that you have got all of your equipment plugged in to the proper places and in the proper order, and you have turned on the system and booted up AW+.

After it has gone through all its grinding and flashing on and off, a menu appears on the screen. Lots of stuff with the first letter of each line looking strange when compared to the rest of the line. This stuff will begin the formal discussion of AW+. When ever you see <p#>, that is the reference page in the manual.

CREATE A FILE <P6> & <P13>

As the name implies, you are about to fill a blank page with some sort of literary genius of your own (or someone else's if you are copying). Stroke the letter "C" and the screen divides itself with the top being blank and, at the bottom, is a second little rectangle with arrows. The arrows are for tab spacing (more about that later).

Next, you will see INSERT MODE. This means that as you type and discover that you have something additional to put in the text, you can go back to the place that you wish to insert that information and start typing as it pushes the rest of the text ahead of it and nothing is lost. If you wish to type over something, then hold down the CONTROL key and strike the INSERT key and you will see the message TYPE-OVER MODE.

Be careful of this arrangement; if you forget, you can lose a lot of hard work. LOWERCASE is next...by striking the CAPS key that word would change to UPPERCASE. If you want to type in only capital letters, then change it and you'll know from the screen that the change has been made.

The bottom line contains a number and BYTES FREE. This number varies according to the type of computer and disk drive you have. BE AWARE OF THE MAXIMUM SIZE FILE YOUR COMPUTER WILL LOAD!!! I learned the hard way and had to do some fancy editing to save what I had written (more about that later).

C=1 is the next thing you see, and that locates you on the vertical axis of the screen. L=1 locates you on the horizontal axis of the screen. Well folks, that locates you on the computer so you can begin your creativity with the best of them, even Bill Shakespeare.

You should be sitting with a blank screen in front of you, so experiment. It's fun and not too many computers have been destroyed with the normal finger tip pressure applied to the keys.

Don't tell me, you are sitting in front of that blank screen too terrified to touch a key! I didn't think so! I mean you might get some sort of a rare terminal(CRT) disease like dry eyeballs or something.

EDIT FILE <P6>, <P13,14>

Once you have started a file and you need to do something else, like checking the formatting prior to printing, just hit ESCAPE (the [ESC] key in the top left corner of the key board) and the Main Menu returns. After you have done whatever you wanted to do and have hit the [ESC] key again, the Main Menu has returned.

Folk's don't panic...I know what goes through many people's minds when that four letter word jumps up, but in this case EDIT means return to the document you were working on. Sooooo, strike the letter "E" (remember it can be a lowercase E) and you are back to those little pearls of literary genius of yours...or hit the BREAK key (that's in the upper right hand corner of your keyboard) and you will be returned directly to your document.

Some of the handy edit commands are:

[SELECT][T]—This takes you directly to the top of your document. Handy when you want to make a change near the top.

[SELECT][B]— This takes you to the bottom of your document when you are done at the top and want to continue writing. Isn't nice how the commands make sense — T for top, E for edit, B of bottom?

[CONTROL]— By holding down the [CONTROL] key first and then holding down on an arrow key, you can scroll a line or column at a time to locate the cursor where ever you wish.

[SELECT][->] and [SELECT][<-] -- Holding down [SELECT][->] moves the cursor to the next word on the right which speeds up the process of moving the cursor; [SELECT][<-] does the same thing in the opposite direction. I found this to be a bit awkward as a key stroke, but that's my opinion.

[CONTROL][A] and [CONTROL][Z]— These are handy commands — [CONTROL][A] moves you to the beginning of the line you are on and [CONTROL][Z] moves you to the end of the line you are on. This is nice when scrolling up and you are on the left side of the screen and want to get to the right side in a hurry or vice versa.

[OPTION] Key Commands — To get to the bottom of the screen (not the document) try using [OPTION] and the down arrow. Use [OPTION] and the up arrow to get to the top of the screen.

DELETING TEXT

If you goof and need to delete a letter, place the cursor over the letter and hold down the [CONTROL] key then hit the [DELETE/BK SP] key then type in the correct letter. The [DELETE/BK SP] key when struck alone works like a typewriter and deletes the letter to the left of the cursor.

There are ways of DELETING BLOCKS OF TEXT <p24>. That sure sounds terrible. Why would anyone want to delete something they just wrote? Who knows? Maybe you decided that particular bit of literary genius stinks and wish to try over.

Anyhow, the first thing to do is move the cursor to the first letter of the first word you wish to get rid of. Next, exert continuous pressure with one of your fingers on the [OPTION] key, while exerting yourself push the [B] key. Notice down in the lower screen where it used to say "INSERT MODE" that it now reads "BEGINNING MARKED".

If you have a lot of text to eliminate hold down the [CONTROL] key and push down on the down arrow to move the cursor down. At this time you will notice that as the cursor moves down everything is now in inverse print. If you go too far don't worry, because all you need to do is back up the cursor with your arrow key to the point you intended to stop. Notice how the inverse disappeared one letter at a time. Now you have all of your text to be deleted in inverse characters, right?

OK, next key strokes are [OPTION] and [DELETE/BK SP]. Please take note of the little message down in the lower left hand side of your screen. It says something like DELETE BLOCK Y/N? This is the biggy, because when you gently touch that [Y] key, ZAP...it is gone! But not forgotten, at least not by the computer.

"Holy cow," you shriek. "What have I done?"

Never fear folks, just place the cursor where you want to replace all that lost composure (pardon the pun) and gently stroke [OPTION] and [X], and as in X marks the spot, there is your lost composure (OOPS did it again). It was saved in the failsafe buffer.

Now let's see, oh yes, dumping everything from the cursor to the end of the file. Let us suppose that you decided that your talents as a writer were in the toilet that day and what you had was garbage. Try this, push the [SELECT] and [DELETE/BK SP] keys. It is gone, and I mean gone — no failsafe buffer, nothing — just gone! (For you 130XE people, this is just to the end of whatever memory bank you are in at the moment.)

OTHER TEXT BLOCK OPTIONS

By the way, before I forget, this is the same procedure for pasting a block of text <pg 25>. Just place the cursor where you wish the first word of the deleted text to pop up at, and push down on the [OPTION] and [X] keys. Nifty, huh? (Attention 130XE users — you can go from memory bank to memory bank with pasting operations, just remember your failsafe buffer is 8K of memory. First get the block deleted, next press [START] and [B] to get to the memory bank of choice and then hit [OPTION] and [X].)

Suppose that you were not writing garbage...suppose that you were so proud of what you wrote that you wanted to see it twice! That is called DUPLICATING BLOCKS OF TEXT <pg 25>.

The main difference between deleting or pasting is that instead of punching [OPTION] & [DELETE/BK SP] at the end of the highlighted text you push [OPTION] & [E]. This leaves the highlighted text in place, removes the highlights and places a copy of the text in the failsafe buffer, where it sits until you place the cursor and strike [OPTION] & [X]. (130XE devotees can carry this action across memory banks as well.)

Another nice editing feature is the ability to take a random list of words and alphabetize them. Lets suppose you have a list of jobs that you have to do and you prioritize this list.

As it sets there on the monitor with the first priority job being the fifth one on the list and the second being the last, why not try this and they will be shuffled into numerical sequence. Press [OPTION] and [B], do the highlighting bit and then press [OPTION] and [A], a few seconds later — voila — they are in their new and proper sequence and you can run off to the garage knowing that the attic is next to be cleaned (or ignored because you discovered that the TV slated for the garage sale works).

To count the number of words in a file just type [OPTION] & [W], and down in the lower left, the program will tell you how many words are in your document. Go ahead and count them!

SEARCH AND REPLACE

Let's suppose that you have written an article about winter. Let's suppose you are now bored with winter. Let's suppose you have a magic wand (an Atari computer), and you are going to change winter into spring. Well this is kind of silly I know, but how else can I lead into SEARCH AND REPLACE (S/R) <pg 26-27>.

According to the manual, you can search out and replace 21 characters at a time (130XE owners can cross memory banks with this procedure). Here is how you get rid of Old Man Winter. First, type [SELECT][T]. This puts the cursor at the top of your article. Next, hit [START][S].

Notice down in the lower left where INSERT MODE was? It now reads SEARCH STRING. Type in "Old Man Winter" without the quotes (or whatever it is you wish to replace with no more than 20 characters) and hit [RETURN]. Now type [START][R], and notice the lower left of the monitor screen reads REPLACE STRING. This is our chance to turn winter into spring, by typing in "Spring" and [RETURN].

You notice that the cursor has moved all by itself to the first occurrence of Old Man Winter! Press [SELECT][S] and the lower lefthand side of the screen reads STRING FOUND. Now for final revenge! Your fingers pounce on the [SELECT][R] keys and Old Man Winter is replaced by Spring. Wouldn't it be great if we could do that with the weather?

What I have described is the case by case method of SEARCH and REPLACE. Another method is to simply hunt out the offending word(s) and use [SELECT][R].

When you are all done with your search and want to make sure that Old Man Winter no longer exists in your file try using [SELECT][U]. This will take you back up through your file looking for a last time for any appearances of Old Man Winter so you can enjoy your newly created Spring.

This may seem a bit tedious, so let's make it easy. Once you have gone through all of the first steps of defining the string and you have typed [SELECT][S] try [OPTION][G]. From where the cursor is setting to the end of the document, Old Man Winter will be replaced with Spring and down in the lower left screen you will see the following: GLOBAL SEARCH/REPLACE COMPLETE. (130XE owners, this will not cross banks. However, you only need to find the first occurrence in each bank, place the cursor as described and strike [OPTION][G] in each bank.)

Here are a few little additional items to help with search and replace. If you have a word like NOT and you wish to replace it, be aware of the word. Those letters appear in other words like NOTHING for instance. So, when you use S/R you must put a [SPACE] in front of and behind the word so that the S/R function of AW+ does not get confused and change parts of a different word. Another function is that S/R will change control characters for you, and you can use [?] as a wildcard.

One final note: you can use S/R as a search and delete function by typing [RETURN] instead of [START][R]. Well folks, that is it for this month. Next month we will try our hand at merging files and some other things that may be of interest to you. In the meantime, punch the keys and see what happens, but save as you write. Periodic saving of your text just may save you a lot of retyping!

New Publication Focuses on Shareware Programs!

Computer Publications, Unltd. (CPU) announces a newsletter for Atari ST/MEGA enthusiasts and shareware programmers. This publication contains news and information specific to the world of public domain and shareware programs.

Shareware authors will find THE SHAREWARE CONNECTION the perfect link for communicating with the ST community. ST enthusiasts will find THE SHAREWARE CONNECTION a valuable resource for information on public domain and shareware software found nowhere else in the industry.

THE SHAREWARE CONNECTION offers:

Reviews of public domain and shareware programs including in-depth feature reviews as well as many "Quick Views," mini-reviews that will give you all the information you need on shareware and public domain programs at a glance.

The latest information on shareware software including the newest versions and upgrades available from shareware authors.

Advance information on shareware programs currently in the works and when we might expect to see the finished product.

Interviews with and features on the top ST/MEGA shareware authors.

Help columns featuring hints and tips for your favorite programs.

THE SHAREWARE CONNECTION'S "Disk-Of-The-Month" which will include only the best and newest public domain/shareware software. The "Disk-Of-The-Month" feature will also include overviews of all programs on the disk.

Unique, easy-to-use forms to provide a convenient method of forwarding shareware contributions for your favorite programs to ensure continued shareware support.

CONNECTION CLASSIFIEDS, PROGRAMMER'S DIRECTORY and much more!!!

Don't miss this exciting new venture which will link ST users and shareware programmers! A subscription to THE SHAREWARE CONNECTION is $15 for 12 issues

COMPUTER PUBLICATIONS, UNLTD., The Shareware Connection, P.O. Box 2224, Arvada, Colorado 80001. Our GEnie address is S.SWANSON1. You can also call 303/423-6805 and leave your name and address.

Hard Drive Myths and Mysteries

by David C. Troy

(c) 1989 Syndicated Networks of Toad Computers, All Rights Forfeited

[Editor's Note: This is our first installment in a series of articles from Toad Computers. Although this was not originally written as the first article in the series, it is the best introductory article to the series.]

While I feel I have addressed the intermediate to advanced users with my previous "HDM&Ms" files, I don't really feel like I have reached the true beginners, the guys who just want to know what the hell is going on. So, this time, instead of talking just to you folks who wanted some explanations of buzzwords, I will talk to the beginner as well, and between us all we can make some sense out of this whole hard drive thing.

You have an Atari ST and a single or double sided floppy drive, maybe you have two, and you're used to it, but you find work sometimes tedious, annoying, or cumbersome because of disk swapping, labeling, or filing.

Your friends say you need a hard disk. They say it will speed things up. "Once you get one, you won't be able to live without it," they say, coyly, knowingly, while you mutter that you're just fine with your floppies. You say, "I don't need to spend the five hundred dollars." And you're secure in that. How much can it really be worth?

But the suspicion nags... Gee, maybe I really do need a hard drive —what if I could try one without anyone knowing? Maybe an all-night computer store... No one would know...

Finally, your lower instincts inch into the decision making part of your brain — you want speed, capacity, and convenience. And you admit it. If passion is a crime, then lock me up. One goes quickly. As long as the wife doesn't find out, you're well on your way.

You start hanging around with the wrong crowd — at the computer stores. You start asking, "So, how much would 20 megabytes be?" "What about 30, or 50... or maybe 85?" You're addicted. Just one use of a hard drive is 99% addictive. "I'll just use it socially," or "I can control it...really." Sure. That's what they all say..

So, now you're looking to buy a hard drive. What, oh what should you buy? Let's look at a few basic factors, and you can determine that by yourself. Price, speed, capacity, physical size, expandability, and warranty.

Price

This is frequently the most important factor. Hard drives are in a weird situation now where you can enter the market for as little as $499 (for a 20mb), or you can spend literally thousands.

The way the pricing breaks down is a little weird. You can get 20 mb for $499, or 30 for $539, or 40 for $599, or 50 for $599, or 65 for $679, or 85 for $709, or 100 for $899, or 170 for $1399. (These are cheap, Toad Computers prices by the way :-)

But anyway, the point is, you'll get yourself caught in an endless loop of "Well, if I spend $17 more, I'll get 20 more megs." All the way to the top of the line. That's why most of the drives I sell these days are 50 or more megabytes. It's simply a better deal. But, if the money on hand is a constraint, the smaller drives are always going to be available. You decide which is right for you. You might choose to analyze it by megabytes per dollar.

Speed

Speed is a factor in choosing a hard drive. The median access time for hard drives sold today is 40 milliseconds. As I explained in my last HDM&Ms file, access time is a measure of the time the drive takes to move from one random point on the disk to another, on the average.

Just to give you an idea, 65 is slow, 40 is good and healthy, and 28 or less is for people who need it or are just weird. The place where access time is going to make a difference is if you have prolonged disk access. Most people don't.

Most people have spurty, once every fifteen minutes disk access. People that run BBSes, or who print with GDOS a lot, or other similar things where the hard drive will run for 5 minutes straight, will get a cumulative increase in speed. You decide which is right for you based on the way you anticipate you will use your drive.

How Much Do I Need?

A good general rule is that a hard drive will hold as many floppies as it has megabytes. Of course, ST floppies are not 1 meg disks, but a hard drive needs to have constant boot programs & desk accessories, and the leftovers will be taken up by that. So, if you have maybe 20 programs you use regularly, a 20 megabyte hard drive might be just about right for you. Although the larger sizes are more popular, don't buy something just because everyone else is. If you don't need the extra, don't buy it.

Another thing you will want to think about is the way in which you will use your hard drive. Will you be using it as a replacement for all of your disks, or as a place to put your most frequently used programs. If you try to put everything you've ever run across on there, you'd want the bigger drive. If you just have your spreadsheet & DTP program on there, you might only need the smaller drive. You decide which is right, based on the way you anticipate you will use your drive.

Physical Size

Drives come in 3.5" and 5.25" sizes nowadays. People sometimes think that 3.5" drives are ALWAYS FASTER, some people think that 5.25" drives are more reliable, some people think that 3.5" drives are always more reliable. These are mostly myths.

Drive size is just a factor of what is convenient for the manufacturer. Most 3.5" drives share almost identical specifications with their 5.25" counterparts. The biggest difference is that some capacities are easier to make in 5.25", others are easiest to make in 3.5" sizes. Don't really worry about physical size when thinking about reliability and speed. (How many times have you used that line in the bedroom?) Worry more about transfer speed and access time.

Physical size can become an issue when it comes time to mount it, though. (What about that one?) For instance, the ICD FAST cases can hold 2 3.5" drives or one 5.25" drives. We at Toad Computers have some cases which will hold 2 5.25" drives, or two 3.5" drives. So know your case and your desire to expand before you committ to a drive size.

Expandability

This goes pretty much hand in hand with physical size. Most drives nowadays are SCSI (scuzzy) drives, and so that makes the issue of a controller moot, thus making remaining case space the only remaining issue. For the most part, with ST hard drives, if it's got the room in there, you can expand it. If it has a controller and the room, you might be able to expand it a little cheaper.

Some drives (like the FAST) have external SCSI ports, so even if it doesn't have the room it's expandable. But you need to get another power supply and case in addition to the drive if you want to do this. You want to make sure that you will be able to format an expanded drive, too. Check with your dealer/manufacturer/streetcorner salesman.

Warranty

(I'm tired — it's 2AM). A warranty is a good thing to have. Don't buy a drive without a warranty. While hard drives are for the most part very reliable, errors do occur, and it's nice to be able to get the thing replaced if it dies. If you can't get it replaced, it's a fair amount of money down the drain. We at Toad Computers have a 1 year warranty on all of our drives. It seems to work pretty well.

Oh well, I guess that's all for now. I'll be back the next time I feel inspired. I hope this has enabled you to decide if you do need a hard drive, and if you do, what size and type of hard drive.

I think next time I'll write about beginner applications and set up of hard drives.

TOAD COMPUTERS

AtariFest '89 -- COMDEX for the Common Man

by John Barnes (WAACE)

East Coast Atarians don't have to travel to Chicago, Atlanta, Las Vegas, or even Anaheim because they can get the straight scoop on the latest Atari doings right here in the "seat of government."

AtariFest '89 is scheduled for October 7th and 8th at Fairfax High School. The event is sponsored by the Washington Area Atari Computer Enthusiasts and the Adult Education program of the Fairfax County Public Schools. Admission is free and the Fest is open to the public.

Since its humble beginnings in a hallway at Fairfax High School in the fall of 1985, the WAACE AtariFest has grown to become the premier East Coast event for Atari users. The 1988 Fest drew people from 26 states and a couple of foreign countries.

Something for Everyone

The fact that nearly 3000 people attended the 1988 Fest is a clear indication that WAACE is providing something people want. The WAACE member clubs, who cover the ground from Baltimore to Richmond, put a lot of effort into providing a varied and interesting experience. There is something for the inveterate shopper, the serious hacker, and the bewildered user interested in learning more about his Atari.

Hardware and software from all over the Atari computing world will be on display and, in most cases, on sale. Leading retail outlets and software developers will be represented. The educational side of the program will feature seminars, demonstration rooms, and a desktop publishing contest. Subjects covered will include desktop publishing, personal finance, computer languages, telecommunications, games, graphic arts, and business uses. Music applications will occupy a special demonstration area of their own. A hardware and software swap meet will also be in operation.

Seminar speakers on Saturday and Sunday will present timely information on the latest products, trends, and problems.

A special feature for 1989 will be "The Best of Atari Desktop Publishing", a contest for anyone who feels that itch to be creative. Download file 10387 for a Publisher ST version of the Contest Rules.

Everyone gets a chance to unwind and mingle with our out of town guests Saturday night at a chinese banquet at the Hunan Lion restaurant in Fairfax. WAACE is recruiting an outstanding speaker and there will be special awards, including the prizes in the DTP contest.

Users Helping Users

WAACE is a confederation of user groups, people who are dedicated to the proposition that someone who has been there is in the best position to help someone else. These groups get front page billing at AtariFest with their disk libraries and membership campaigns.

Public domain software for Atari computers is a vital part of the mix and there are plenty of experts on hand to help you find your way.

Uninitiated members of the public who have never been in a user group are in abundance at the Fest and the groups can recruit very effectively. Anything that can inspire this much loyalty has to be worthwhile.

It's Your Fest

While the Fest doesn't cost the public anything it does cost the sponsors a lot of sweat and tears. It takes about 150 people to set up the space and tear it down again, to staff the demonstration rooms, to assist the vendors, to print the program, to register the visitors, to plan the banquet, to sell advertising, to generate publicity, ... the list goes on and on.

For the 1989 event the organizers will be canvassing over 300 vendors from all over the world. Additional vendor space has been arranged for, and a dressier look will pervade the whole Fest. Additional print advertising is being laid on to encourage attendance at the Fest.

A bigger and better AtariFest means a bigger bill for labor. Something like 20 percent of WAACE's total membership will have to help. People from other clubs and other areas are welcome wherever they can help. There are lots of opportunities in the seminars, the demonstration rooms, advertising sales, graphic arts production, you name it.

The only profit the organizers and their workers take home is a feeling of satisfaction in sharing the joys of Atari computing with the rest of the world.

Compuserve folks who want more information on the Fest can send E-Mail to WAACE Vice-Chairman, Charles Smeton at 73047,2565. I would encourage everyone to capture this and spread the word throughout the land.

What Atari Left Out of Some STs

by Bill Pike (PAC)

This article originally appeared in the Computer News published by the Portland Atari Club and the Original Eugene Atari Computer Enthusiats

When Atari started making the ST series of computers there were some computers that were made with an RF Modulator and a composite video output. Atari has also constructed quite a few ST computers without these items.

You might ask, of what use is RF output and a composite video output to a person who already has a RGB monitor? Well, yes, a person with an RGB monitor has a much clearer picture in both low and medium resolution modes than a person who is using a standard TV or a composite monitor.

However, what about the person who has just purchased an ST and doesn't have the necessary funds (near $400) for an RGB color monitor? Or what can you do if you want a bigger than 13" picture to show in front of a larger group of people, like 50 kids that just found out you have a computer and want to play video games, and most of them are your bosses's kids? Or maybe your monitor goes "bye bye" right in the middle of an article that you have put off for about the 20th time with a deadline of last week, and you have a composite monitor that you use on your 8bit machine.

Well, if you happen to be one of the lucky ones that have a 520STfm or 1040STfm, you are still in business even if the video isn't quite as clear.

If you don't have either of these machines, you are stuck, sorry.

Atari has not installed either an RF Modulator (used with a standard TV set) or a composite (standard video signal) output on any machines except the 520STfm and 1040STfm machines. Now you can do something about this.

Practical Solutions has come up with the VideoKey. VideoKey is a unit that plugs into the monitor output jack on ANY ST or Mega computer. It changes the RGB output to three different outputs: RF [suitable for a standard TV] Composite Color [suitable for any composite monitor] Monochrome video [suitable for a green screen or amber screen monitor]. By the way, you also have the audio output along with the video.

Ok, you still have the equivalent resolution (sharpness) of a standard TV in all three outputs, but this sure is a lot better than nothing or 50 people gathered around a 13" color RGB monitor.

A small digression, even your 520STfm and 1040STfm might not have the clearest video that your computer is capable of producing in the composite mode; the VideoKey produces the best available.

The output of the VideoKey is standard 75-ohm video and 1 volt of audio into 1-kohm. These are the same values that your stereo amplifier or VCR uses. The RF output can be set for channel 2 or 3 if you wish to use a standard TV.

The connection to the computer couldn't be simpler — just plug the cable from the VideoKey into the monitor jack of the computer. Plug an RCA-type jumper cable into the connections you want: RF for Standard TV, composite video and audio into your VCR, audio into your stereo amplifier, etc.

The only problem that I had with the unit was adjusting the ColorLock (a small screwdriver adjustment on the bottom of the unit) for a picture without rainbowing (colors drifting across the screen). Just follow the instructions included with the unit to adjust.

Once this has been adjusted, it is quite stable and will not need to be readjusted until you change TVs. However, the adjustment is a little touchy (a little change has a large effect), so take it slow and easy.

The suggested retail price of the unit is $99.95, however it can be found at prices in the $60-$70 range with a little shopping. I would suggest the purchase of this unit for anyone who has the needs mentioned above. It is also a good, lower cost, back-up for your existing monitor.

For 520ST, 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.
Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A: Socketed, no RAM	$129
520B: 1 MB, socketed	$249
520C: 2.5 MB, socketed	$495
520D: 4 MB	$795
520-1: 1 MB, non-expandable	$199
1040A: 1 Bank sockets, no RAM	$110
1040B: Fully socketed, no RAM	$149
1040C: 2.5 MB + 1 bank sockets	$495
1040D: 4 MB	$795
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 3-22-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own	- $385		
10 MB	- $485	30 MB RLL	- $695
20MB 48 ms	- $595	40 MB ST251	$795
30 MB f. ht. 45 ms autop. CDC	- $745		

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own	$295		
10 MB	- $395	30 MBCDC	- $565
20 MB 48 ms	- $525	40 MB ST251	$745
65 MB 22 ms autopark RLL drive	$845		

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB	- $349	30 MBRLL 48ms	- $570
20 MB	- $485	40 MB ST251	- $645
63 MB h. ht.22 ms auto parking	- $795		

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:

10 MB	- $295	20 MB 48ms	- $398
30 MB full ht. CDC 45 ms	- $465		

Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.
Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available!
Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts (CACE) is the Atari club in and around the Jackson County area. The main purpose of the club is to help inform new users and to promote the use of Atari computers in the community.

President	Brent Fisher	764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The current membership dues are $10 per year, or $14.80 if you wish to subscribe to Atari Interface Magazine, and are payable at any of the CACE monthly meetings, or by mail. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter. Any written communication with CACE or payments by mail should be sent to: CACE, P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place at the East Side Lounge, on the corner of Horton and Gansom Streets in Jackson, MI.

Fishin' Around by Brent Fisher

Greetings and salutations fellow CACE members. This coming month we will have the August meeting which will be held Sunday the 13th from 1 pm to somewhere around 4 pm at the East Side Lounge on the corner of Ganson and Horton.

To All of you ST people out there, hey listen up. Some of you might know this and some of you might not. Anyway, the club maintains a Post Office Box here in Jackson. We receive quite a bit of ads and other computer related information through this box. If you are interested in what the newest stuff is that you can get for your ST, or even for you 8bit people, come to the next meeting. I will have tons of this stuff all set out and ready for you to take home. Some material that you might be interested in: Issues of ST World, The WordPerfect Corporation newsletter (if you haven't seen these you really need to check them out), and issues of STing, a ST newsletter from Coopersville (you've really got to check this one out — NICE). And while I'm on the subject, we also receive newsletters from Great Lakes Atari Digest and MAGIC. So as you can see there is plenty that you have been missing if you haven't attended a meeting in a while.

Those of you who didn't make the World of Atari Show missed out on a lot of software and hardware for some really decent prices. I picked up a 1020 color printer for $10. Those of you who don't know about this little printer should come to the next meeting and see a demonstration.

Lately I've been hearing rumors that Roy Goldman, the author of Daisy Dot and Daisy Dot II (What do you mean you have never heard of these programs, this is a program that allows you to use whatever near letter quality font you like with your Epson compatible dot matrix printer?), will soon be coming out with Daisy Dot III. It has been said this program will allow use of near-letter quality fonts with almost all dot matrix printers and has expanded font capability. I personally can't wait for this one. If you don't have either of the Daisy Dot programs mentioned above, you can get them from the club's library.

This next part is for those of you with modems. Bob Puff has released his latest version of BOBTERM. Version 1.1 allows direct use of the SpartaDOS command line, those of you who have been using DeTerm will appreciate this. And if you have been using 1030 Express! this is the program for you. If you don't have access to the club's board yet, get on. Or, if you would prefer, you can get the program from the club's library.

BOBTERM and Daisy Dot are two of the finest shareware programs around for the Atari 8bits.

Well, anyway I know that those of you who receive AIM have not had an issue since May. I called Pattie again today and left a message on her machine (I just hate those things, don't you?), so hopefully we will be getting those issues soon, and maybe this one a bit earlier.

I think that this is about it for this month. As Dennis Miller would say 'That's the news and I am out of here.'

CAPITOL HILL
ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

For Sale

GENESEE ATARI GROUP

Serving the Flint area

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Inc.

GAG meets on the second Wednesday of the month at the Neithercut school, located at 2818 Crestbrook Drive, Flint. (Off Atherton between Hammerberg and Van Slyke). Meetings begin at 6:30 pm. All are welcome. GAG is a participating member of the Atari Interface Magazine, and members can purchase subscriptions at a greatly reduced rate. GAG is also affiliated with the Great Lakes Atari Digest, and members receive a free subscription with their membership. Membership is $15 per year for the family.

GAG has an exceptional public domain library of 8- and 16-bit software. Contact one of the officers to receive a complete catalog. GAG also has a large magazine library for use by it's members, including Antic, Analog, ST-Log, Start, and several others. We do not support piracy. Piracy is theft!

For more information contact:

FACTS BBS		736-3920

President's Report by Jerry Cross

Not much to report this month. With the school closed we can't hold our July or August meetings. The next meeting will be in September, same time, same place.

The FACTS bbs is now running the new Michtron BBS software. This is a multi-line bbs supporting 3 lines, just like the NiteLite software I used to run. It works far better, had many more features, and so far I have not had any major problems or crashes. I'm sure you will enjoy it's features. The number is 736-3920, and supports 3,12,2400 baud. That's it for now, see you in September.

For Sale

520 ST Upgraded to 1 Meg
2 DS & 1 SS Disk Drive
Color Monitor
PC Ditto, Business Programs
and some game software
Asking $1000
Call Nate at 548-8029

GKAUG GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets on the second Saturday of each month at 11 a.m. in the Dewing Hall, Room 305, on the Kalamazoo College Campus, corner of Academy and Monroe. Dues are $25/yr and include a subscription to Atari Interface Magazine.

President	Frank Fellheimer	657-6106
Vice President	Dan Youngs	
Treasurer	Open	
Archiver	Dave Oldenburg	
Librarian	Bill Berner	
SysOp	Alex Stevens	
GKAUG BBS		(616) 657-2665

Next meeting: Saturday, 09 Sep 89. We are not scheduling meetings for August this summer. Your AIM will come in the mail as usual...if your dues are paid, of course.

A few of us devoted members managed to make it to the Dearborn computer show. I can only say that it was most impressive. There were tons of ST programs and hardward devices available. I also was able to look at a number of 8bit programs, but there wasn't as much available as there was at the last show I went to.

A note here for you users of the GKAUG BBS. Shortly, maybe even already, the BBS will be changing location and we will have a new number. It will be in Kalamazoo so a lot of you will have access to it without a long distance call. There are currently 85 active users and we hope it will grow a bit. We will be adding additional drives so there should be a greater selection of programs and activities. Our new number is: (616) 385-2448.

You will need to log on again, get a new ID number, but you should still be able to use your old password if you get on quick and no one else gets there first. I hope to keep you informed through the summer, so check your AIM.

Call me if you want to consider a new position of leadership in the club. I may not be able to continue in this position this next fall. If I cannot, the club will be limited to those who have access to a modem, and all business will be handled by phone.

M.A.C.E. MACE

MICHIGAN-ATARI-COMPUTER-ENTHUSIASTS

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)
MACE East	(313)978-1685	(3/1200)
The College Board	(313)478-9647	(3/12/2400)
DownRiver Outpost	(313)675-4660	(3/12/2400)
Molin's Den	(313)420-0407	(3/1200)

The July meeting of MACE was held on Tuesday, 7/18, in the Southfield Civic Center. Meeting Coordinator Bob Retelle called the meeting to order at 7:45pm announcing the feature topic would be "Those Excellent Programs You Should Avoid." Bob noted the topic was chosen tongue-in-cheek and that no malicious intent was to be inferred.

President Bill Rayl announced the annual officer elections would be held during the September meeting, and that nominations would be entertained in August. There is really no need for only one person to run for each office. Bill announced that ST Librarian Ed Hanson would be selling blank disks in bundles of 10 for $8, while 8bit Librarian Ted Newkumet would have blank disks (also in bundles of 10) for $2.50. Ed also would be selling 3.5" disk labels and the STICKER III program for $6.

Bill and Bob spent about 20 minutes discussing Atari News. The big topic seems to be the "un-release" of TOS 1.4; no one really seems to know when Atari will be making this upgrade available to end users, however developers are reporting having received the new chips. There was quite a bit of discussion amoungst the membership about the ST World of Atari Show held in late June, both positive and negative reactions were aired, however, the general consensus among those who attended the show was that it was worth attending even though some of the announced exhibitors DID NOT.

Member Steven Sturza started the demonstrations of "excellent programs" by showing Reeve Software's "All Pro Hockey." Steven noted "This is one program you would NOT want to buy," and showed some painfully slow graphics. Other programs that were demonstrated: Star Trek, The Next Generation (good initial graphics and sound effects, but the game is little more that a glorified text game); The Hippo Almanac; Metropolis by Paradox (this silly game laughs at you when you lose!); the Dungeon Master Hint Disk (this is really not a bad program at all, simply that it's virtually useless unless the user owns 2 STs or is willing to jump out of game play to load up the hint program then finally re-load Dugeon Master again); and ST Talk Pro (a much ballyhooed terminal package from QMI that is prone to crashing.)

On a lighter note, Bob Retelle showed the Fun Face program which allows the user to develop facial drawings from a variety of pre-drawn ear/eyes/nose/mouth/hair sketches. This program was released as a demo of a commercial package that never materialized. The members got a number of chuckles out of the various faces Bob developed, and one loud boo for not having any female sketches to work with.

The next meeting will be held on August 15th.

Michael Olin, MACE Rec. Sec'y

TINKER ACE OF OKLAHOMA

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at Route 5, Box 539, Blanchard, OK 73010 or at the TACE BBS (405) 755-9561, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Corrrespondence - $15.00.

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the last Saturday before the 18th of the month, at 2pm at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township. Upcoming meetings are August 12th, and September 16th, 1989. Officers:

President	Steve Volker	793-2955
ST Librarian	LeRoy Valley	686-6796
Treasurer	Marty Schmidt	792-6029
8Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20, which provides support for both the 8Bit and ST, and full access to the club's PD library, along with a year's subscription to the Atari Interface Magazine. Check your mailing label, if you need to renew,(or haven't joined us yet!), DO IT NOW!

First Up

What a nice meeting! It seemed as if EVERYONE had a story about a great software or hardware deal found at one of the two most recent Atari shows (M.A.C.E. and World of Atari), held in May and June respectively.

Pro and Con discussions on excellerator boards, 4096 color upgrades, the portable Atari ST-STACY, the VCR tape-sized PORTFOLIO, and upcoming SOFTWARE, began in small groups before the meeting, and continued on after, to become a number of informative and interesting debates. Questions surfaced as to what was available in the area, and where, and the topic of local dealers was brought up. A poll was taken on who had visited either of the local stores, MIDI-TO-GO and SIMPLY SOFTWARE (both on Euclid in Bay City just a few blocks from each other), and there was a good show of hands. It was agreed that support of these two shops was an important and beneficial part of membership in the local Atari community.

Officially, four proposals were presented, with the first two tabled and the other two passing without dissent. Steve Volker opened a forum on membership, with ideas of greater visibility in the community, a membership form (introduced by Jerry Monroe), club identity with t-shirts, buttons, or hats, an elected officer with the duties of membership goal setting and fulfillment, etc. Topic was tabled for next month when hopefully more members will be present. Leroy Valley made a motion to raise the cost of copied library disks to provide cash flow into the club treasury and to facilitate upgrading the library to double-sided disks. This was tabled, with nods of general agreement, until the new cost for the disks is determined and will also be reopened at the August meeting.

The proposal to convert our ST Library to a double-sided only medium was motioned from the floor by Leroy, and seconded by Jerry Monroe. It was passed with a note on converting programs on an individual basis for those few who still have single-sided drives. The final proposal, presented by Leroy and seconded by Steve Volker, was a recommendation to purchase 50 blank disks for the ST library. Leroy agreed to place the order.

What YOU Missed

Wayne Fenior showed remarkable familiarity with the object of his demo, MasterCAD. Despite having the software only one month, he easily zipped through the programs myriad of pull-down features, such as ANGLE, ZOOM, PLANES, VIEW-POINT, POLYLINE, 3D AND 2D modes, like a pro. Some of the pluses of MasterCAD include the ability to view your creation from the inside out, a SPIN with up to 99 points, GROUP, FLIP, COPY, and PROPORTION processes, and two ways to print your output. The only major downside mentioned was the lack of dimensioning capabilities, and a less than spectacular med-rez display. MasterCAD from MichTron comes on a single, Double-Sided disk, and requires at least one Meg of RAM. Wayne reviewed it on his Mega 2 with TOS 1.3 and a blitter, and it was impressive.

What YOU Shouldn't Miss

We've managed to coax Leroy Valley back to tne podium as he demos LAZER 'C' debugger. Though the application is for use only with the LAZER 'C' package, LeRoy suggested that it would be a good tool for introducing the "uninitiated" to the uses and functions of a good debugger. (I know I'll be taking notes!)

Coming up at the October meeting (hopefully) is a demonstration of the TouchUp/Hand Scanner package available from MIGRAPH. From what was shown at the World of..show, this should be something. On the 8Bit side, Ted Beauchamp was unable to make the club meeting and our newest member, Hank Kaufman was the only eightbitter present. Hopefully Ted will be able to do his demo next meeting.

On Another Note

We have an exciting raffle coming up next meeting for the game TOWER TOPPLER. We have picked up one new member at each of the last two meetings. Leroy will have our new ST Library disk catalog done, and our new members drive is growing steadily with newspaper ads, a mention on TV-5's Community Calendar, posted signs at local dealers, and with, hopefully, each of us bringing along a friend or relativeto the next meeting. We have the potential for an extended period of growth as Atari finally gets itself together in America. Let's all take time to promote the Tri-City Atari Users Group whenever the opportunity presents itself. Remember: A BIGGER CLUB MEANS BIGGER AND BETTER THINGS TO COME!

Equipment Volunteers for August: Leroy Valley Mega4 Bryant LeFreniére Color Monitor Ted Beauchamp 8 Bit Computer and Drive Jerry Reno 8 Bit Monitor

Remember, if your bringing equipment, please bring all the necessary cables,(i.e. power cords, monitor cords, mouse, or whatever.)

July Minutes

The July meeting of the Washtenaw Atari Users Group was held on Tuesday, 7/11, in the Wolverine Room of the Michigan Union on the campus of the University of Michigan. There was a bit of a scramble at first as no one seemed able to remember where the monitor cable had been stored, and we nearly had President Craig Harvey convinced that the meeting would not start promptly at 7:30pm as is his goal. It turned out the cables were hiding inside Dick Selke's brief case (which we'd have known if we'd only asked... "If you ever don't know something, just ask me!" was Dick's only comment!) Mike Olin demonstrated the improved sound quality resulting from the Tweety Board upgrade kit and described the installation procedure.

Craig introduced himself and the club to the visitors and announced the feature topic for this meeting would be MIDI/Music. Craig also announced the August meeting topic will be "Hard Drives," September's will be "Utilities" and October will be "Emulators" (pending any of the members have received their Spectre GCR or PC Ditto III by then...) Craig showed a newsletter he had received from Gadgets by Small which gives a list of functions the Macintosh emulator can/cannot do and then went on to briefly discuss some of the various "speed-up kits" for the ST.

Craig then turned the meeting over to Vice President Richard Schrader who spent the majority of the evening treating us with his musical talents by tweaking and peeking a considerable array of MIDI hardware which he was kind enough to bring from his home studio. Rick showed us many of his techniques for recording and editing his compositions, and then went on to show how his experimentation is ultimately printed into musical score using his deskjet printer.

Co-Editor David Brzezinski demonstrated the Antic Music Processor (Dec. '88) showing how .AMS files can be converted to this system and then edited and saved as new files. On a fanciful note, the lyrics can be displayed on-screen during replay resulting in an interesting graphic presentation.

8Bit Librarian Mike Millage sheepishly announced he had forgotten to bring the library with him. (Mike graciously volunteered to let Wilma spank him, but word has it she took a rain check...) ST Librarian Russ Crum announced he had disk specials of some MIDI utilities from the library as well as a new update for the catalog disk. Dick Selke gave us a financial report, after which the meeting was adjourned so the curious could seek further MIDI enlightenment from Rick.

Michael Olin
WAUG Rec. Sec'y7/12/89

A Word From The President

Having survived my first general meeting as WAUG's new President, I thought it was time to let you know where WAUG is headed in the coming year. As you can see from the meeting minutes, we started things off with a (musical) bang with a great midi/music show thanks to the particular interests of a couple of members. I intend to continue having meetings that will both entertain and enlighten us all on the many capabilities of Atari computers.

For instance, the August meeting will cover the creation and/or purchase of a hard drive for your computer (8bit or ST). In September, the topic will be utilities, and I'm working on getting Darek Mihocka (creator of many great shareware utilities for the ST as well as the 8bit emulator) to demo his creations. For October, you will get to see how to run IBM software at 12 mhz on an ST, how to slip a Macintosh disk into your ST drive and run it better than a low-end Mac can do it, and how to attach your 8bit disk drive to your ST and then run your 8bit software on it (no, you can't do all three of these things at once!). Another topic that we plan to do is "Packet Radio" which allows calling around the world without the use of phone lines (or long distance charges), almost as if you were calling a local bulletin board. December, as usual, will be the games meeting.

If you do anything with your Atari that not everyone else is also doing, or if you want to see something that you've only heard about, let one of the officers know (or better yet, come to an officer meeting yourself).

Craig Harvey

From The Treasurer

We had four Renewals in June, the David Brzezinski family, the Don Neff family, Jay Skotcher and the Bruce Urbanski family. We must be doing something right. Welcome back folks.

If you missed the July meeting (MIDI demos) you should kick your butt, Rick and David educated and entertained us to the Max. If this was only some of the equipment that Rick has in his lab, I would really like to see his BOOM ROOM. Fantastic Night Rick, THANKS, from all of us...

Remember, if you would like to join or renew your membership. Send your $15 check or money order to Dick Selke, 31139 Cooley Dr. Westland, MI 48185. Till next time, keep cool.

for sale at $2.50 for 10 disks!
There is a limited quantity
of blank ST Disks
priced at $8 for 10!

Some Spellers are Better than Others.

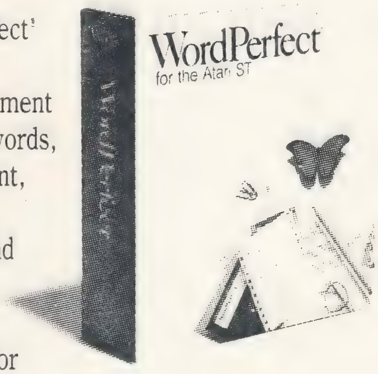
Before she won her regional spelling bee, Margaret Hollingsworth pored over seven different dictionaries for more than three hundred hours.

And while we'd all like to be champion spellers, most of us just don't have that kind of time.

So may we suggest putting the WordPerfect® Speller in your corner.

Not only will the Speller check your document (or any section of it) for errors and double words, it will instantly count the words in a document, page, or block of text.

You can look a word up phonetically to find the correct spelling, and the Speller will give you a list of replacement words with similar sound patterns. Or if you're looking for just the right word, and you know it begins with "s" and ends in "-ology," use a wild-card character to replace the unspecified letters. The Speller will show you a comprehensive list of your options.



With the WordPerfect Speller (included in your WordPerfect software for the Atari), more than 115,000 words are at your fingertips. No other speller can match that kind of power.

Not even Margaret.

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM

(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory
(Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) Only **$39.95**

Digisound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only **$39.95**

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs **DIGISPEC!**

Only **$39.95**

Polydisk Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**

(Clock option card is also available for Polydisk $29.95)

Enhance your publishing power.

Migraph Hand Scanner.

Add scanned graphics to all your projects quickly and easily with the Migraph Hand Scanner.

The Hand Scanner provides a scanning window over 4″ wide with four scanning resolutions: 100, 200, and true 300 and 400 dots per inch. It also offers adjustable contrast, three dither settings for scanning halftones, and a special setting for line art.

Build your own library of images. Logos, photographs, books, illustrations . . . provide you with an unlimited supply of art.

Touch-Up,™ Migraph's high resolution image editor, lets you scan *and* edit your images. Powerful editing tools include crop, invert, resize, flip, cut and paste, multiple zoom levels, a full array of paint tools, and much more.

When your images are "pixel perfect", import them into your favorite ST publishing programs like Calamus, Fleet Street, PageStream, and Publisher ST. In addition, several save formats let you use your images on the PC and Mac.

The Migraph Hand Scanner and Touch-Up. Powerful tools for professional publishing.

For all Atari ST and Mega systems with monochrome or color monitors, 1MB memory and 3.5″ DS disk drive.

See your dealer today for more details or call us direct. Dealer inquiries invited.

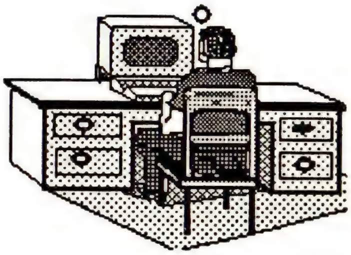
AIM is produced on a 2.5 Meg Atari ST, HP LaserJet II, Timeworks DTP and PageStream.

Atari Interface Magazine is a monthly publication that also serves as the official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS. A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable). Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of AIM or any participating club. Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp.



Editorial Ramblings

With the "revolving door" at Atari in full swing again, we thought it appropriate to take a quick look back at all who've come and gone.

Mike Dendo, Joe Mendolio (and secretary) and Chris Roberts have all left Atari in the past two months. Chris Roberts was hired only a short time ago to replace Cindy Claveran, who in turn replaced Sandy Austin. Joe Mendolio was hired a few months ago and Mike Dendo was made Vice President of Sales and Dealer Relations only a few months before that.

Mr. Dendo and Mr. Mendolio were hired to fill vacancies left by Larry Samuels, Tony Gould, Vincent Giammettao and Chuck Babbit. Others to recently leave Atari include Les Player (General Manager of the STacy project), Shiraz Shivji (ST Designer), Richard Frick (Entertainment Division head), Neil Harris (Communications) and programmers John Scrutch and Roy Goode. Cindy and Chris had the distinction of being fired, while all the other people mentioned apparently left of their own accord. Doubtless, there are others who were less publicly know who have also left Atari.

With all of these people leaving Atari, many of them within months of coming aboard and many of them holding key management positions, one is inevitably left wondering about Atari's ability to formulate any plans for the "long haul." How can a company with "short-term management" ever hope to design and implement long-term planning? It is our opinion that Atari's lack of direction and commitment, at least from all outward signs, is a direct effect of Atari's inability to hire and retain quality people in key positions.

The most important question, of course, is this -- why can't Atari keep these quality people on the payroll? Most speculation points directly at the Tramiel family and their peculiar style of management. One on-line personality on CompuServe likened the problems Atari Corp. and the Tramiels are having to troubles faced many years ago by then-family-owned Ford Motor Company and the Ford family.

If indeed many of these executives left Atari due to clashes with the Tramiel family, the Tramiels should look carefully at the devastating effects their "style of management" could have on Atari's future. We've seen a lot of talented, knowledgeable people leave Atari in the past two years. We've also seen an Atari that vacillates from one project to the next with little tangible result. For Atari to overlook or ignore the connection between these observations, or worse, to continue on as if there was no problem within Atari headquarters, could be disaster.

In the computer industry, image is very important. Atari's seeming lack of direction, due in large part to high executive turn-over, is giving Atari a "Keystone Cops" image. If Atari Corp. is ever going to be a credible force in the computer industry, the underlying problems contributing to Atari's poor public image must be resolved.

Bill & Pattie Rayl

From the Reader's Viewpoint

Dear Editor,

Enclosed you will find a check to restart my subscription. I am most interested in your 8bit articles. I think your magazine and Current Notes are the two best Atari publications on the market.

Dave Harris,
Selfridge, ND

PS. Any news on an 80 column version of Paperclip? I have AtariWriter 80 and it is just as pathetic as AtariWriter Plus. The 80 column screen is nice though.

[Editors' Note: Dave, we haven't heard anything about an 80 column version of Paperclip. Sorry that we can't help you, but the column from Jimmy Boyce of CACE may help you get more from AtariWriter.]

The Sniper's Column

In the June issue of AIM, there was a vehement argument between the editors of AIM and Leo Sell of CHAOS/Great Lakes Atari Digest (GLAD) fame. In the ensuing battle of text that followed, we noted that a reference was made to the publications of Z*Magazine and ST Z*Magazine, in which these publications were referred to as Z*Rag and ST Z*Rag.

We at CACE regard these comments as an infringement upon our publication rights, as it is well known that we publish the only "rag" in Michigan. Should such references occur again, we shall consider legal and/or military action against these parties (or we may even give these would-be offenders a dirty look and a nasty innuendo).

Also, we feel that we have not been given adequate magazine space in AIM to express our snipes. And we resent the fact that no one has ever argued with us, or complained in the slightest degree about our articles. As a result, no one reads our articles anymore.

Should anyone wish to bicker, contend, dispute, fight, hassle, quarrel, quibble, squabble, tiff, wrangle, or call us something derogatory, we can be reached through the CACE post office box:

C.A.C.E.
P.O. Box 6161
Jackson, MI 49204

For those of you who would prefer to argue with us online, we may be reached through the CACE BBS at (517) 787-4011.

Thanks for your support.
Tim Sharpe and Brent Fisher

Atari Bulletin Board

by Bill and Pattie Rayl

Things certainly have been happening in Sunnyvale since last month, and not all of the happenings have been good.

Atari's Revolving Door

About a month ago, Joe Mendolio "unexpectedly" left Atari, taking his secretary with him. When asked about the reason for his departure, a credible source within Atari stated that, although they could not discuss why Mr. Mendolio left, "his leaving came as a complete surprise to us."

Also gone is Atari's recently-hired User Group Coordinator, Chris Roberts. According to Atari, Chris was fired, but no details would be discussed. Possibly the STacy "accident" that occured en route to the Dearborn World of Atari show may have had something to do with the firing. Other sources have indicated a possible clash between ST World's Rich Tsukigi and Chris Roberts may have played a part as well.

New User Group Coordinator

The good news here, though, is that Atari has already named a new User Group Coordinator. Bob Brodie, an active User Group supporter and past contributor to the online Z*Mag, replaces Chris Roberts. Atarians who know Bob Brodie personally say he is very capable and an excellent choice for the position.

Finally, in the "revolving door" category, Mike Dendo, Vice President of Sales and Dealer Relations has also left Atari rather suddenly. Again, no word as to why Mr. Dendo left has come from sources within Atari.

Dealers in the Michigan area were very impressed with Mike Dendo on his visits to this area.

Profits Decrease Dramatically

One other bad note before we move on to more positive news.

The August 15 Edition of *The Wall Street Journal* reported that Atari's second quarter profit "plunged 94 percent to $327,000 or one cent a share." Atari reportedly blamed depressed video game sales due to unfair practices by Nintendo and foreign currency rate fluctuations as the cause for such a dramatic drop in profits.

Atari's Color Portable Entertainment System, unveiled at the Summer CES in Chicago, has been renamed. The handheld game machine is now called the Lynx and it will reportedly be shipping in the next few months.

Portfolios Sold to FedEx

Federal Express has reportedly contracted to buy an undisclosed number of Atari's new IBM-compatible Portfolio. Rumor is that most key executives of Federal Express will be issued a Portfolio. The Portfolio was also on display at the *PC Magazine* Editor's Day held on August 18. Sig Hartmann and other Atari representatives were on-hand to answer questions.

New ST, the ST-E, Announced

According to Matthew Seitz, an employee of Moses Computers and an attendee of the *PC Magazine* Editor's Day event, Sig Hartmann said that the ST-E was available as of mid-August.

It seems from the information given by Sig Hartmann that the ST-E is the "Amiga Killer" we've all heard rumored to be in the works. Mr. Seitz reportedly contacted Gayle Johnson, Atari's Developer Coordinator, who knew absolutely nothing about the ST-E. No dealers who were contacted had heard anything about the ST-E, either.

SIGGRAPH Show

Frank Foster of Atari US and representatives of Atari UK and Perihelion attended the recent SIGGRAPH Computer Graphics show in Boston, MA.

The ATW (Atari Workstation) was being "unveiled" for the first time to the US market. Two ATWs were running, one with 13 transputers running a flight simulator and the other (with only one transputer) showing an array of color demos. Atari's small booth at the show was reportedly getting a lot of attention!

One attendee, Thomas D'Alimonte of Missing Pieces, a software and consulting firm, reported on CompuServe that "The flight simulator was fantastic! The smoothest shaded polygon rendered landscape and plane I've seen in real time.... Nothing short of ILM (Industrial Light and Magic) would be better."

Atari Front Page News

Finally, on the Atari homefront, the front page of the *Detroit Free Press* recently mentioned Atari in their "Sound-off" call-in poll column. The column mentioned that "In the West German branch of the US Computer firm Atari, non-smokers have been given an extra six days of vacation per year to compensate for the cigarette breaks that smokers get."

Glendale Atari Show Cancelled

The annual Glendale Atari Show has been cancelled this year. According to show producer John Tarpinnian, the show will not take place due to ST World scheduling a World of Atari Show in San Jose just two weeks after the Glendale show was set to take place.

Similar to problems faced by the Michigan User Group, MACE, the Glendale sponsors decided to call it quits. "The ST World show cancelled the [Glendale] show," John Tarpinnian informed us.

In the wake of this conflict, ST World has also cancelled the San Jose show, but not soon enough to allow the Glendale Show to continue. "The wheels are in motion," said Mr. Tarpinnian. Dates for the Glendale Atari Show have already been set for 1990 and 1991.

According to an ST World spokesman, no more shows are planned for the rest of this year.

Viruses on the ST

Reports have been coming in concerning a "sleeper virus" or "trojan horse" that has become fairly widespread, at least in the Midwest. Information from User Groups in Michigan, Ohio, Illinois and even Ontario, Canada indicate that this virus may be reaching epidemic proportions. Although this "sleeper" does no damage, ST owners are urged to wipe this virus out before someone creates an accompanying "key disk." For more information on this virus, see the article "Neo STAG Struck by Virus" elsewhere in this issue.

Across the pond, a particularly nasty virus has been discovered in pirated copies of Leisure Suit Larry. Sierra On-Line, producers of the game, reported on the virus in their Spring '89 issue of the Sierra Newsletter. According to the Financial Times (London, November 30,1988), the virus "copies itself to the hard disk. After a pre-determined time or a certain amount of use, the virus obliterates any data stored on the hard disk." The virus has been reported in Switzerland, Germany, The UK, The Netherlands and has even reached the US. Most notable, the virus reportedly infected hard drives on the Dutch government's network and has hit a number of banks and trading houses in London. Sierra On-Line has stated their absolute assurance that "software leaving our plant does not contain any virus."

New Products

Very soon, ST gamers are going to be able to purchase a game that is guaranteed to be a smash hit. Bloodwych, soon to be released from Mirrorsoft of the UK, can only be described as "two-player Dungeon Master." With game-play and graphics similar to FTL's bestseller, Bloodwych is sure to be a big seller. The game allows two players to each recruit a party of four to explore Castle Bloodwych. The object of the game is to find the four crystals in the castle's towers, bring them together in the center of the castle and defeat the horrible Bloodwych. According to Mirrorsoft, the ST version of the game should be available by the time you read this. For an excellent, playable demo of Bloodwych, contact your local User Group or download the demo from the major on-line services.

A Colorado-based company called Maxwell CPU has announced release of the GoGo ST, a program similar to CodeHead Software's Hotwire. At a retail price of $34.95, GoGo ST allows ST owners to create lists of programs and then execute the programs with a single mouse click. GoGo ST also has the ability to keep track of how much time you spend in each program. Also available from Maxwell CPU is a product called MegaSTender, an "extension cord" for your Mega ST keyboard. The MegaSTender comes in 6, 8, 12 and 25 foot versions, and the 25 ft length starts at $24.95. For more information, contact Maxwell CPU, 507 W Baseline, Lafayette, CO 80026 or (303) 665-4849 voice or BBS at (303) 666-4470.

K-Products of Salt Lake City, Utah recently bought rights to produce and market an 8bit hard drive interface for Supra hard drives. The K-P Hard Drive Interface is available from K-Products, 4267 W. Midway Dr, Salt Lake City, UT 48120.

XL/XE owners who have been wanting to add a light gun to their system can now purchase a light gun from BEST Electronics. The gun offered by BEST is fully compatible with the new light gun cartridges, comes with a 9 foot cord and retails for $34.95.

For the ST (and XL/XE) computers, BEST Electronics has begun shipping the BEST Mouse at a retail price of $49.95. For a review of this new mouse, see elsewhere in this issue. For ST owners with a Taiwan-made mouse, BEST is offering an upgrade called Mouse +. This kit replaces the current photo-optic interruptor shafts in your mouse and adds Teflon rollers for smoother, near maintenance-free operation. BEST Electronics, 2021 The Alameda, Suite 290, San Jose, CA 95126 or (408) 243-6950.

If you're an owner of any 8bit Atari machine and you're looking for some of the older, hard to find software/cartridges or books for your computer, chances are that American Techna-Vision has what you need. American Techna-Vision carries many hard to find items and even stocks 8bit motherboards, chips, accessories and Sam's ComputerFacts manuals. In fact, they have "one of the world's largest inventories of Atari 8bit material." For a catalog or more information, contact American Techna-Vision, 15338 Inverness St, San Leandro, CA 94579 or (800) 551-9995.

Last, but not least, is a newsletter now available for all ST desktop publishers who want to get the most from their machines and software. DeskTop Publishing:Atari Style gives useful tips for the most popular DTP programs and reviews of new products that make the desktop publisher's job easier. This newsletter will be a great help to the novice who wants to learn the fundamentals of typography, publication design and page layout. The power DTP-er should also find the newsletter useful. Six issues are only $9.95. Contact E&L Productions, 27 Cedar Hill, Sumter, NC 29154 or call (803) 494-2201.

Turbo-Info #3

What is the Turbo-OS and What Does It Do?

by Chuck Steinman (DataQue)

This is the third part of a multi-part information article on the Turbo-816 from DataQue Software for the Atari XL/XE computers. The previous installments went over the basic system and the memory, and this article will explain some of the unique functions of the Turbo-OS.

What is Turbo-OS?

Some background on the Turbo-OS for those of you which have just tuned into the AIM Channel #816.... The Turbo-OS is an operating system for the Atari XL and XE computers which either can fully replace the Atari OS you now have or be used in addition to the Atari OS. The latter application requires the addition of a toggle switch to allow for user selection of which Operating System is active. A version for the 800 computer will be offered also. The Turbo-OS will only operate in systems with the Turbo-816 CPU adapter card installed.

My original intent was to have both the Atari OS and the Turbo-OS in one PROM. This would have reduced the amount of hardware needed and simplfied installation.

Due to my not being able to aquire an acceptable agreement for the Atari OS, the Turbo-OS is a seperate PROM, without the Atari OS included. This results in an additional 28 or so solder connections if the "Dual-Prom" option mentioned above is installed. Another option is to use one of the commercially available OS switchers, which include a PC board with multiple OS sockets and a selection switch.

There are two sections to the Turbo-OS, the normal CIO/SIO system interface and the new user interface. The latter is a menu system which allows the user to perform many new unique features. Also there are many new CIO vectors, which perform memory management and system control functions.

The Turbo-OS menu features include the following:

- A non-interactive NotePad mode which is similar to the Atari 400/800 memo pad mode. While not too useful, kids get a kick out of it, and it does come in handy for certain applications.
- A full 16 megabyte hexidecimal and ATASCII dynamic memory dump utility. This will continuously dump the contents of a specified block of memory to the screen. There are several command keys to make moving about the large addressing range a breeze.
- A system configuration key, which will scan the addressing range of the Turbo-816 for applications and memory. If applications are found, they are installed into a menu, where they can be executed by a key selection. Up to 8 of these applications can exist.
- There is a memory option to clear areas of RAM including: Standard RAM, Banked RAM (extended), Application RAM (explicit), and Expanded RAM. There are several options as to exactly how the RAM is cleared.
- There are many built-in keyboard "hot" keys which can be made active from the Turbo-OS menu. An indictor shows the current status of the hot keys. These keys will allow the cursor to move about the screen quicker, and turn the video, key-click, and SIO noise on and off. Also key repeat and delay rate are adjustable from the keyboard.
- A built-in diagnostics screen will allow for verification of all memory types, including the Turbo-OS PROM. Also, there are provisions for testing the keyboard, joystick controls, paddle controls and other peripherals.
- There are also keys to select either a cold start of the system, or an option to return to the users application program if one is active.

The new CIO (Central Input/Output) system calls include the following:

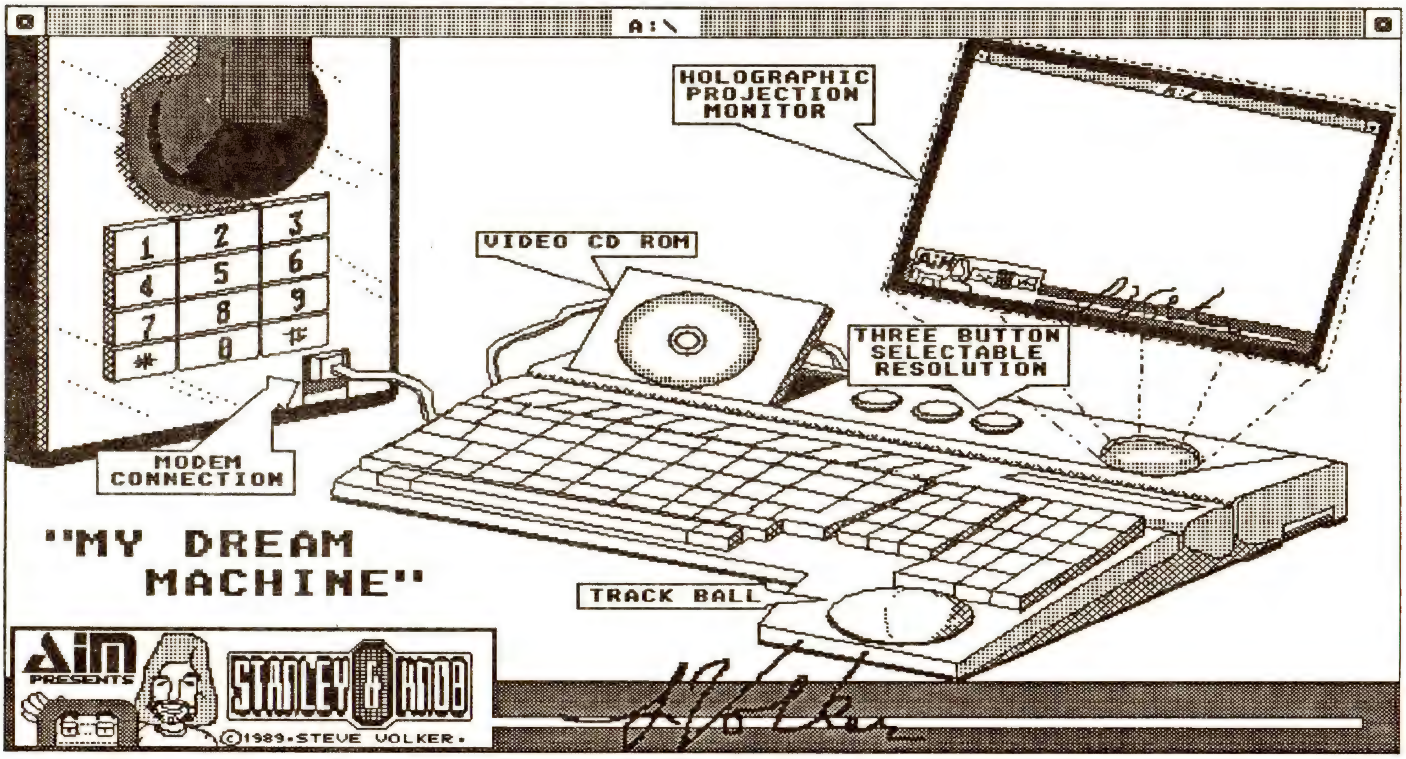
- CalcOS: Calculate and return the checksum of the OS ROM in register A.
- TRAMCk: Scan one (or all) of the three types of non-standard RAM.
- TAlloc: Allocate a specified amount of one of the four types of RAM.
- TDaloc: De-Allocate a specified amount of one of the four types of RAM.
- TExecu: Execute an installed Turbo-Application.
- TIniti: Initialize an intalled Turbo-Application.
- DoBank: Select one of the 16 possible Extended RAM banks.
- NatVec: Call an OS function from outside the 64k address range.

- CpyBuf: Copy up to a 64k block from-to anywhere in the 16MB range.
- FilPat: Fill a block anywhere in the 16MB addressing range with a pattern.

Another feature of the Turbo-OS is the improved floating point package. These routines are called by many application programs and languages such as the Atari BASIC and Atari Assembler/Editor cartridge. The amount of increase in speed ranges from 10% to over 300% and is being improved further. The improved routines were originally coded by Charles Marslett and were merged with the Turbo-OS under his direct authorization.

Some items, which should be noted about the Turbo-OS and compatibility with current applications, are:

- The C: (cassette) handler was removed to make room for the Turbo-OS enhancements and Turbo-menu. If the C: device is used, there is an installation option to allow the original Atari OS to be selected by a toggle switch. Anytime the cassette is needed, a flick of the switch will allow the system to communicate with the cassette.
- The extended character set table was also removed to free up more memory. This should not be a significant problem for domestic units, and like the cassette device, could be selected by switching in the Atari OS.
- Two routines to support the uploadable device linker from the 1090 interface were deleted. Their entry vectors terminate with an appropriate error. It was felt that there was no need to support this device in the Turbo-OS, and again, the switch option could be used if needed. Insufficient documentation would have precluded me from being able to write the routines from scratch anyway.
- A few games, and even fewer applications, scan the OS and compare it against the Atari OS. If any OS other than the Atari OS is resident, either an error message is printer or some other abnormal sequence follows. The switch option will allow these programs to run as normal.
- Some user written programs, and a few commercial programs, have used illegal entry points into the OS. The only valid entry points in the OS are on page $E4xx as listed in several reference documents. To simplify coding, or reduce code size, some people feel that using subroutines in the OS, other than the vectored ones, is a way to reach that goal. This is not as common as it was before the XL series was introduced.
- A very rare compatibility problem exists where a program either uses an unpublished 6502 op-code or feature. This has only shown up in two programs out of the several hundred programs tested by the beta testers. There is no easy fix for this, unless the program itself can be patched to remove the conflict. This would be evident if the program would not run with either OS activated.
- Finally there is a compatibility problem with certain pbi devices which do not buffer the address and data lines properly. The problems of this type are limited, but I am looking at modifications to the motherboard to correct the problem in all cases. The problem occurs only when the pbi device is attached to the Atari and is related to noise generated when that device is accessed.



The Right Brain

by Paul D. Stampfli (El Paso)

Author's Note: For the purposes of this paper the terms IBM and MS-DOS will be taken to mean any computer operating on the MS-DOS standard as its native operating system, as popularized by, and including, IBM. IBM, APPLE, Mac, MS-DOS, and other terms are registered and/or copyright by their parent companies, International Business Machines, Apple Computers, and Microsoft respectively. (Gee, I hope that's right, and am I ever glad that it's over!)

My second disclaimer is that this is actually a slightly revised issue of the article that I wrote for the August 1989 issue of the El Paso ST Club Newsletter. That is the last issue that Tim Holt, our club president, and I did together as Co-editors prior to hooking up with Atari Interface Magazine. Frankly, I just didn't have the time to do a totally new article before the deadline rolled around. Now to the more serious stuff...

Sorting It All Out

What the heck is going on over at IBM/MS-DOS and Apple? I'm confused. Have you ever noticed that no matter how much you don't want to look at a car wreck when you drive by it on the road, you somehow feel compelled to look anyway? That's how I am in this situation. I really don't want to look, but the magnitude of the disaster forces me to look.

I'm still getting those darned MS-DOS magazines that the subscriptions haven't quite run out on yet. (I subscribed to those back in the days when I wanted a "serious" computer.) And I sometimes make a mistake and look at them.

It's a mistake 'cause I feel so bad for the poor consumer who is reading this trash like it's just come down from the Mount of Olives. And boy is this chicken getting plucked in fine fashion! I don't get Mac magazines (fortunately I never wanted a Mac), but if I'm any judge at all of the human condition, those chickens are taking a major change in feather style as well. (They're getting plucked even worse than the MS-DOS guys.)

IBM Imitates MAC

Ok, let's try to make sense out of all of the "bru-ha-ha" and get organized. First, the MS-DOS world is trying to "re-invent" the Mac. Finally, after all this time, after all the ignoring of the Mac, not to mention the languishing of Microsoft Windows, IBM has jumped on the bandwagon.

Now, suddenly, they say that "their research" indicates that business people want a graphic interface to reduce training and retraining time and, therefore, money.

What they don't want to talk about is that with the wave of DTP (DeskTop Publishing) in the computer world today, the IBM standard is in some danger. It just doesn't have the tools to do the job quickly, cleanly, and conveniently.

DTP is best accomplished with a mouse. I know. I've used a keyboard command set and the mouse. The mouse wins without question. I haven't used a Track-ball, but I understand that they are difficult to use in intricate maneuvers because they amplify "user jitters," that slight motion that we all have in our hands all the time.

So IBM wants to re-invent the Mac. To get the mouse, the basic software, and a decent starter system, get that *big* checkbook ready.

You need to know that IBMs (and all its numerous clones) come in just a few basic designs.

- The PC – Not much used anymore, the original.
- The XT – the one we are most used to seeing in the ads, based on the Intel 8086/88, or NEC V20, series chip, generally a basic system, mono, no bells, no whistles, can be had in the $1000 range.
- The AT – based on the Intel 80286 and 80386 chips. These are the speed demons you hear about running at 20, 25 and even 33 mHz! Buy in for the basic, no bells, no whistles, mono, AT class machine is in the $2000 – $2500 range.
- And finally, the PS/2 machines. This is a new line of IBM (and a few clone makers) that covers from the XT through the AT style with some new bells, whistles, cases and wiring.

The newer idea is a bigger (wider) bus (pathway for data) which leads to more information flow and higher chip and throughput speed. The bottom line is that they go awfully fast. Probably faster than is necessary for a personal, at home, computer.

These are clearly business oriented machines, meant to handle very large databases and huge volumes of numbers in spreadsheets. They also have opening price tags in the $5000 and up, UP, UP, range. And let us not forget that huge operator training "curve" lurking out there. Anyone tried to explain 1-2-3, or maybe WordPerfect or WordStar to a novice user lately?

Let's Hear it for PC Ditto!

PC Ditto, at this time, makes us PC compatible, the hardware version of Ditto II is going to make us XT compatible. And faster than most of the garden variety XT's out there. I think that Ditto II with JATO will make us a slow AT class machine, but able to run 286 specific software. I have JATO and when I run the "Norton" I see I have the world's SLOWEST 286 system! Now do you see why I'm confused?

Apple has already re-invented the Mac with the new SE-30 version. It's supposed to be an IBM killer, what with the mouse, one meg of RAM, 40 meg hard drive, and built in mono monitor. Why, it's new SUPERDRIVE can even read/write MS-DOS format disks!!! (Something my little Atari 520ST "Game Machine" has been doing just fine without modification for over three years now.) Aren't you impressed? If not, stand by, the price tag, basic, is $5000. Color will cost you additional $$$$$. Now that's impressive!

Intra-Compatibility

What about intra-compatibility? I think that's going to be the wave of the future. Business is tired of all this "custom applications, raise the price, raise the training cost, lower the profit margin" stuff. They want to buy whatever they like in software, take it to the office and use it. They do NOT want to have to make the devastating choice of either waiting and hoping it comes out for your machine, or scrapping all your hardware to match the software.

By the way, for all of you who believe in the MS-DOS standard, well, it just ain't so. It was once, but now it's like driving a "Chevy." "Is that truck, car, what model, what options, which engine, etc, etc? Oh, and by the way, you can't haul wood in your Berretta." Ok? Since the introduction of OS/2, the operating system for the PS/2 series of computers, there is no such thing as an IBM "standard" unless you ONLY deal with IBM and no one else. In which case I've got some land for sale...

MAC Imitates IBM

Mac talks a lot about a "DOS Bridge" that will make Mac *The Name* in computers. Remember that SE-30 we talked about before? The salesman at a local authorized dealer (This is El Paso, remember?) was VERY careful to tell me that the bridge did NOT make it fully compatible with MS-DOS — just "some selected applications like WordPerfect and Excel." By the way, the bridge goes for "$1500-1600 depending..." I didn't have the guts to ask what it depended on. We were already up to $8000 plus for my color Mac SE-30 and I didn't have a printer and *no software* for either IBM or MAC.

If you say "intra-compatibility" to IBM/MS-DOS salespeople they mostly laugh. One even had the guts to tell me, (I was playing dumb) that there was NO software written for which an IBM version didn't exist that was better and (hold on) *usually cheaper.* I was nice, you would have been proud. I didn't even bite him. (Well, not too hard anyway. Maybe all this civilization stuff is taking the edge off my instincts.) To make a long story shorter, to get the mouse ($150) and "WINDOWS", a Microsoft product that is supposed to be as good as GEM, (check the resolution, I don't think so!) ($99) will require an AT class machine. That works out to slightly less than $3000 without a printer at a local dealer out at "Computer Plaza" on the freeway. The salesman was polite, courteous, and very helpful. I felt kinda guilty about being less than truthful with him. He did make the point that these are RETAIL prices and could be negotiated if I bought a package deal. I might even be able to get some software thrown in on the package...

To the Point

"So Stampfli, you've done a lot of talking and 'BSing', what's your point?" My point is that Nick Sullivan wrote an outstanding article in the July issue of Home Office Computing that started all this. Here are a few paraphrased quotes that got my blood pressure working.

"A Mac gives me a greater sense of power and control that an MS-DOS machine does. I love the ability to size and move windows around the screen, to cut and paste between any two programs, and to quickly move to the middle or end of a file by just moving the arrow on the edge of the window. The ability to store a grab bag of pop-up programs (called desk accessories on the Mac) is also a big advantage. The Mac is more fun to use... It's now clear that the original design concept of the Mac was rock solid... "

My point is that I sat down, spent the time on the phone, and came up with the price comparison between the three systems (see table 1) here in El Paso, not in New York, not in some second rate magazine from some fourth rate company that may never deliver. All these companies are local, established, and have a reputation in the city. They aren't chain stores that can afford to loose money. I only identified Jenkins' Computer Store because he was the only one who gave me permission to reprint the facts and figures.

My point is that for roughly the same, or much much less, money, *never more,* I can run all the software I have ever found made for the Big Three of personal computing. Pay attention class, this is the wave of the future here! Neither of the other two even come close to making the compatibility jump, and the solutions of IBM, (to re-invent the intent of the Mac interface), and the Apple solution, (make it kinda sorta compatible and charge as much as a good, separate, XT machine for it) are totally unacceptable to me.

My point is that the Software is *there* for the Atari, WordPerfect, DTP in lots and lots of flavors, dBMan (a dBase III Plus like program that runs on the Atari and shares files with the MS-DOS version), and then a new program LDW (Logical Design

BEST ELECTRONICS

ST/Mega

First shown at the World of Atari show in Anaheim our **New ST/Mega Compatible Mouse $49.95**

The very **Best** mouse cleaning kit we have seen, it's so good it has an U.S. Patent on it!

"The 360 Cleaner" $16.95

Hard drive builders and Megafile 30 owners, check out our new low price on 3 ft molded hard drive cable male to male $15

6 ft ST **Monitor cable** male to male $19

Happy Discovery Cartridge Option 1 upgrade kit, clock, 3rd+4th drive circuitry $27

Right Angle ST 40 pin connector $4

ST/Mega CX22 **Trackball/mouse** $24

Back in stock! with 1987 pricing 6ft Disk drive cables $15 ea. 25" Disk drive cable $12

520ST Owners thinking about selling your computer to upgrade? Make that computer look like a new computer with a new 520ST case set. Reg $40 **Sale $29**

Mega Owners! Need a longer keyboard cable? Try our new cable that is 5"-7" longer in its coiled form. $12 ea.

Goldstar **ST Monitor** TH901 Thermistor $8

Xformer Cable The Xformer Cable allows Atari 8 bit peripherals to be used on ST/Mega systems and data transfer from 8 bit to ST. Xformer software and Documentation not included $19

Mouse + Upgrade for the Taiwan-made Atari Mouse CALL

BEST ELECTRONICS
2021 The Alameda Suite 290
San Jose, CA 95126
(408) 243-6950

Works) Power, a Lotus 1-2-3 program that the authors refuse to call a clone, it does however share files and Macros with Lotus 1-2-3 version 2. LDW Power goes for a retail price of $149.95, check the price of Lotus the next time you're out there. And if you just Have to have that 1-2-3 come up on screen, get PC Ditto II and run Lotus, WordPerfect, dBase III Plus, or any other MS-DOS program faster than most XT clones. Now where else can you find an XT clone for $300? Just try it, I dare you.

Hurray for the ST!

What the heck is going on over there, anyway? I'm just as happy as a pig in stink with my TOS/MS-DOS/Mac(able) little GAME MACHINE. (Or as Jim and Tom call it, the "STIB-MAC") I like that name, perhaps it will catch on.

While on a recent vacation in the Pacific Northwest, I wandered into an MS-DOS clone store. Nice folks, polite and patient. When I told them what my machine was doing and what I could do with it, they got VERY interested in who owned the patents and when they could get some to sell in the greater Seattle area. When I told them it was an Atari at first they didn't believe me. So I talked them into calling a local Atari dealership and asking all the right questions. When I asked if they would start dealing Atari, they laughed and said "Only if we can put it in a PS2 tower case and put someone else's name on it." I'd like to change that image, but it still haunts us.

And finally, if Mr. Sullivan thinks that the Mac design was rock solid, what would he think of the design of the Atari ST and Mega series of computers? Besides, how much more bang for the buck can you get? Think we should tell those other guys that the ship has already sailed? Nah...

Mac SE-30
Basic — Mono **$5000** Mouse, 1 meg RAM, 40 Meg Hard drive
Extra — Color (Monitor & card) $15 - 1600 MS-DOS bridge $1700, 5& 1/4 inch PC Drive $ 329 **$8529 PLUS**

MS-DOS CLONE — AT Class (Intel 80286)
Basic — 20 Meg Hard drive **$2500** 640 Kbytes RAM, Color monitor
Extra — Mouse $ 150, MS Windows (software) $99 **$2749**

Atari 1040 ST (At Jenkins' Computer Store)
Basic — 1040 ST (1 Meg) RAM **$1000** Mouse, Color System
Extras — 5 & 1/4 PC Drive $ 200, 30 meg ICD FAST HD $650, PC Ditto II $ 300, Spectre GCR $ 300, Mac ROM's $100 - 200 **$2550 - 2650**

NOTE: These prices are retail and making a good "deal" is possible. Also note that the MS-DOS clone will only run MS-DOS software, The Mac will run Mac and "some" MS-DOS software. The Atari will run TOS, Mac, and MS-DOS software. The difference is not just the dollars, it's the utility.

Madame Librarian

A Magazine Article DataBase

by Gordon Totty (MACE)

Madame Librarian was written by David Plotkin, one of the more prolific writers on the Atari scene. It was published by Astra Systems Software, a branch of Southern California Astra Systems, Inc. The copy I reviewed is identified on the disk as "v 1.0, 9/13/88" and in the documentation as "Rev 7." It was written in OSS's Personal Pascal.

You might have trouble finding Madame Librarian with the demise of Astra, but if after reading this you think it is for you, I suggest you write to David Plotkin at the following address:

Dave (Madame Librarian) Plotkin
488 Walnut Avenue
Walnut Creek, CA 94598

Madame Librarian is a special purpose database which you can use for cataloging magazine articles. It comes with its fields set up for that purpose alone. While you could, I suppose, put any kind of information into these fields that you want, you would be limited by the sizes of the fields and use the titles given them.

The fields are: Title, Page, Description, Magazine, Issue, Author, Type, and Language.

You can search for records that match words or phrases in any of these fields except issue date. I looked at about 200 of the entries and the earliest date that I noted was December, 1985. The latest was September, 1988, so this database contains almost three years worth of records of ST articles. The records represent articles about the ST that were published in Antic, Analog, ST-Log, ST Resource, STart, Compute's Atari ST and Compute.

In case you are wondering, I already checked and learned that I didn't write any of the articles in this database. I am prolific in other pursuits and arenas. At least, I think I am! You can add any articles from any magazine that you wish to the database.

You can print out listings from the database. One word of caution, however. The program does not send line feeds to the printer, and so you may have to configure your printer to compensate, unless you like to sit and watch your print head blacken one line for a few minutes.

There sure are a lot of Atari magazines, aren't there? Sometimes I feel like we have more magazine support than software support. Plotkin's database can help you bring order to some of this pleasant chaos. In my home, all of the piles of magazines in my study can be moved to the basement after the articles I am interested in are added to the database. Then, one small diskette and maybe a printout can remain in the study with the rest of the material "archived" in "remote storage."

Without a database like this, I would be (have been!) reluctant to move the magazines to the basement. I felt that if I did, I would never use them again. The database is the key. I can use it for quick reference and, if I find something that looks interesting, then go to the basement to dig it out. I would know as I started down to the catacombs exactly which issue I wanted. Gosh, if I arrange them in order this could get to be downright efficient!

The documentation is complete and clear, owing no doubt to Mr. Plotkin's skill as a writer. I have always had a suspicion that some software houses would publish much better documentation if they would only let a professional writer prepare it. While this instance proves nothing, it is valuable data that reinforces my hunch. Heck, I can show you documentation that could have been improved if the software house had only let a reader look at it before printing!

I'm getting off the subject here, but one final thought: Wouldn't it be fun to be on a panel of documentation pre-publication reviewers? "OK, Smedley, you read it. Now, what do you do first?" "Uh, ... gosh, I don't know." Mr. Plotkin does not leave you with that feeling of not knowing what to do next.

Madame Librarian came with a coupon that could be used to order upgrades, which are available monthly. Perhaps once or twice a year would be enough for you, but with monthly updates you'll know when you order an upgrade that it should be up to within two months, at most, of being current. This used to cost just $5.00, plus $1.25 shipping and handling, and was available directly from Dave Plotkin.

Unfortunately, though there is provision for you to save your own input as part of the database that you first acquire, I saw no information on how to merge this revised file with a new update from Plotkin. A couple of smaller databases, perhaps split by magazines (his and yours), might be more efficient than one big one.

Do you really need to buy this database? I imagine most of you have a word processor, spreadsheet, database program or all three. Although most spreadsheets, and some word processors, lack a search function, you could still do a fairly nice job of simply organizing data with these programs. A database program would give you more functions and flexibility than Madame Librarian.

However, if, like me, you do not have such a database already established, for a small expenditure you can now have most of the work done for you. I don't know about you, but I am lazy. My time is worth more than a few bucks. Well, at least sometimes it is!

Review of the Tempus II Text Editor from MichTron

by Craig Harvey (WAUG)

I purchased Tempus II from Michtron at the World of Atari show in Detroit, and my first reaction was WOW! That's FAST!

And I saw all the features it had like character redefinition, macros, sorting, choice of cursor motion from line to line, comparing files, etc., and I said another WOW.

However, I quickly realized that there are a couple basic features that any editor should have, and the lack of them sticks out like a sore thumb when you actually try to use Tempus II.

For instance, I started writing this in Source mode (no wrapping) since I had tried Wrap mode enough to know that it did some really weird things. Source mode meant that I had to hit Return at the end of each line.

Of course, I eventually found something I wanted to go back and change, but when I did I was hit with the alert "Warning: Line 7 too long!! The desired command cannot be executed because the maximum line length would be exceeded." (As an aside, trying to type those quotes was interesting, since you have to hit shift-2 to get a double quote. Hitting the quote key gives you the @ sign. Luckily the user can be fix this in the keyboard definition table.) The alert did not provide any choices for how I could remedy the situation.

However, having become familiar with the editor, I knew I could either reset the line length to something greater than 80 characters (not a good idea for anything you plan to print out eventually) or to switch to "Word wrap mode." I went ahead and switched to word wrap mode, and some fascinating things occurred.

It went ahead and performed word wrapping of ALL the text instantly (remember what it does, it does FAST). This sounds good, but on all those lines where I had put Returns at the end of the line, the last word of that line became one with the first word of the next line, and thus was all put at the beginning of that next line.

So.... I went back and inserted spaces between the two words. And now I'm typing away in word wrap mode thinking that all is fine UNTIL I decide to start a new paragraph. The first time I hit Return now, it will simply display a little 'cr' in the cursor without moving anything anywhere.

Then I hit Return again, and finally it moves the cursor to the start of a new line, while sticking that cute little 'cr' at the end of the line I was on. Note that it didn't bother putting any such 'cr' symbols after all the other lines.

So, what does this little 'cr' mean? It means that instead of ending a line with the standard CR/LF (or whatever other characters you care to specify in the setup parameters) it adds an extra CR (ascii 13), resulting in a CR/CR/LF combination in the saved file — just what one needs when you thought you were dealing with a straight simple text editor. I still haven't figured out what I'm going to do when I want to print this thing out. (Later note: it does print out fine from either Tempus or the desktop.)

Now that I've made both source mode and word wrap mode sound perfectly wonderful, let me add my biggest peeve about source mode. Even if you have specified some nice long line length (it will go up to 255) and you have two nice short lines that you wish to merge onto one line, you CANNOT do it by simply hitting delete at the end of the first line or backspace at the start of the second. Either of these approaches does absolutely nothing.

The only ways I've found to do it are (a) select one of the lines (which requires double clicking with the left mouse button at the start of the line, and then double clicking with the right button at the end of the line), move the cursor to the desired insertion point and execute the Block Move command (from the menu or with a CTL-V), or (b) create a macro that will do the actions of (a).

And if you think it ought to be possible to delete the second line and then undo the action with the cursor at the end of the first line, you're right — it OUGHT to, but it isn't. The undo command ('undoable undo') will only undo the last deletion and it will only undo it by placing the deleted characters exactly where they were originally. (Give me my Flash editor!)

Working my way down my list of gripes, we now hit the subject of search and replace. Yes, what it does, it does FAST, and it even has some really great search/replace features like allowing the search string wildcards of '?' and '*' for one or any number of characters, respectively. (And I thought I had written the only ST search/replace routine that allowed wildcards <smile>)

Another feature I haven't seen before on the ST is the ability to specify a column range for the search/replace function. For instance, you can tell it to replace '111' with '123' only when the '111' occurs within columns 10 – 20 of any line. However, it will not let you search for whatever characters it is using as end-of-line markers (normally CR/LF), and it will therefore not let you find any string that starts on one line and continues to the next line.

And now for a couple final minor grievances. Access to the macro recorder can only be obtained from the keyboard and not from any menu function. (In trying this out right now, I just lost ?ccess to the first letter of the ?lph?bet by defining ?ssigning ? m?cro to it, so be c?reful.)

OK, I'm back now, with full alphabet in hand, after saving, quitting Tempus, and returning. The last thing I noticed was that in the keyboard definition file someone apparently truncated the lines at 60 columns when there had been text going beyond that point describing various key functions. There is enough text remaining that you will probably be able to figure out what the missing pieces should be, however.

Let me close with some additions to the list of good fun things Tempus II has to offer, which I began way back in the first paragraph.

- Edit 4 files at once (with block move/copy among them)
- Optional full justification in word wrap mode
- Configurable file auto-save, screen-saver, and corner clock.
- Upper/Lower case conversion.

And especially for you programmers:

- Cross reference generation (which also allows using compiler error output to go to the line and column of an error in the source code)
- Checking for balanced structures (e.g. pairing of comment symbols in source code).
- Built-in RPN calculator with decimal/hex/octal/binary conversions.
- Run another program (e.g. compiler) from Tempus with parameter passing (the parameter passing was not compatible with my TDI Modula-2 system but hopefully is OK with other compiler systems). Also, go the other direction and run Tempus from another program with parameter passing.
- Shift blocks right or left (great for adding/deleting execution loops in programs).
- Optional print out of line numbers in the text.

In closing, there are other things Tempus can do, but the above are the ones I considered most fascinating.

Tempus II is small and fast for all that it does (the prg file is about 70K and it's all done in assembler). It will run in either high or medium resolution. Tempus II costs $79.97.

Final note: everywhere above that says "fast" should read **INSTANT**.

How much is YOUR time worth?

Turbo ST turns your 520/1040 ST into a speed demon. Check out **Turbo ST** at your local dealer or download our free demo from your favorite bulletin board.

Upgrades to version 1.6 are only $5 with your original disk. For more information, call (407) 657-4611, or write to SofTrek, P.O. Box 5257, Winter Park, FL 32793.

The ToadFile 44

The first LOW PRICED Removable Cartridge Hard Disk Drive!

We at Toad Computers wonder why good technology always has to mean high prices and long waits. We have the Toadfile 44 **now**, available in varying configurations with fixed drives up to 129 megabytes, while other companies are still telling you to wait. We also have **the lowest price** available. We use the same drive Atari™ will be using in their drive, and compatible cartridges will be available at your Atari™ dealer, or through us. Finally, the capacity of a hard disk with the convenience of a floppy. Only from the leaders! Toad Computers.

ToadFile 44 - ONLY $899!

Basic unit includes drive, one 44 megabyte cartridge, case, power supply, fan, ICD™ host adapter, clock, formatting and partitioning software, and a 3' DMA cable. Please specify an under-the-monitor case or a shoebox style case. Both may hold two 5.25" or 3.5" drives. Extra 44 MB cartridges are $99 when purchased with drive, or $109 later.

ToadFile 44 *Variations*

ToadFile 94 *(44 MB Cartridge + 50 MB Drive 40ms time)*	$1279
ToadFile 109 *(44 MB Cartridge + 65 MB Drive 40ms time)*	$1309
ToadFile 129X *(44 MB Cartridge + 85 MB Drive 28 ms time)*	$1399
ToadFile 88X *(2 44 MB Cartridge Drives & Carts, 25 ms time)*	$1549
ToadFile 44S *(44 MB Cartridge Drive, Case, Power & SCSI In)*	$799
ToadFile 44D *(44 MB Cartridge Drive Only, No Power or Case)*	$699

Toad *Hard Disk Drives*

Toad 30 *Drive 40 ms Access Time 3.5" Mechanism*	$539
Toad 50 *Drive 40 ms Access Time 3.5" Mechanism*	$599
Toad 85 *Drive 28 ms Access Time 5.25" Mechanism*	$709
Toad 100 *Drive 40 ms Access Time 2 3.5" Mechanisms*	$899
Toad 170 *Drive 28 ms Access Time 2 5.25" Mechanisms*	$1399

Hard Drive Myths & Mysteries
Part Two

by David C. Troy

(c) 1988 Toad Computers

This article explains many myths & unravels the mystery of hard drives a bit. It may be distributed freely, and is considered to be public domain, provided it remains unmodified, and credit is given to the original author.

So, you want to get a hard drive? Well, I am going to quickly go over a few solid facts about hard drives so that you may become better acquainted with the technology and thus pose more probing questions, allowing you to learn more on your own. I do not intend to go over every little detail, as I don't believe it's necessary.

The Basics

The first thing we need to recognize is that the DMA plug coming out of the back of our ST is NOT standard. Its heart is in the right place, but in order to hook up a hard drive to our DMA port, we need some more circuitry. That more circuitry is called a Host Adapter. It converts the ST's non-standard DMA port into something that is standard called SCSI, or to draw it out, Small Computer Systems Interface.

Now that we have a SCSI (pronounced Scuzzy) connection, we can attach standard SCSI devices. Standard SCSI devices include: Hard disk drive controllers, hard disk drives with imbedded controllers, tape backup controllers, and other amazing things. What Atari and Supra drives use are MFM hard drive controllers. ICD FA•ST drives use drives with imbedded controllers. You can't use a hard drive without a controller. It may be an imbedded controller, but you need a controller. You can't use an IBM hard drive controller. They aren't SCSI — they use the IBM bus, another non-standard interface.

So at this point, just for laughs, let's say that we have an ICD ST Host Adapter with an Adaptec 4000 MFM Hard Drive controller hooked up to it.

Now that we have a hard drive controller, we can hook a hard drive up to it. (See, this does make sense.) Virtually all hard drive controllers connect to ST506/412 flavor hard drives (Don't taste them: they have a 20 pin card edge connection and one 34 pin card edge connection, that's how you can tell.), most HDs are ST506/412 though, so don't worry too much. You CAN hook up IBM hard drives (not hard cards) to your ST by way of your SCSI controller, but be sure to chuck the IBM controller — remember, it won't work.

So at this point, you have an ICD ST Host Adapter, an Adaptec 4000 MFM hard drive controller and a Seagate ST225 20 Mb hard drive connected to your ST.

Add a Little Juice

What's missing from this picture? Power, and cabling too. Electricity makes it work better. You will need a power supply with 2 disk drive connections (+5 & +12 Volts). Let's say, just for laughs, that you're using the power supply & case from Toad Computers. You'll have a fan & all the power you need to get this thing going.

As far as cabling goes, you need to connect your ST to your host adapter. The DB19 cable comes with the host adapter. You need to connect your host adapter to your controller. For this, you need a 50 pin array female to female cable, which comes with a ST Host/Controller Kit, but may need to be purchased/manufactured separately based on your needs. You need to connect your controller to your hard drive. For this you need a 34 pin cable, as well as a 20 pin cable. These can be purchased with an ST Host/Controller Kit or with a whole drive system kit.

Things You Should Know

Most SCSI controllers can handle 2 drive mechanisms each, but some take as many as 4. You can run up to 7 controllers on one host adapter board (which means probably 14 hard drives). Drives with imbedded controllers cannot handle a second slave drive. To expand such a system, a second controller, or second drive with imbedded controller, must be purchased.

MFM and RLL are terms which refer to capacities of hard drives. Think of MFM as single density & RLL as double. Some mechanisms are certified for RLL and others are not. It is possible, and is becoming increasingly discouraged, to format MFM drives in RLL, although with older drives it can be done usually successfully. RLL controllers cost more, as do RLL drives, but they don't cost much more, and they provide about 150% increase in storage over their MFM counterparts. But different people have different needs.

Ask a dealer like Toad Computers for advice if you have any questions. We'll be back next time with some more exciting hard disk facts!

Neo STAG Struck by Virus Origin Unknow -- Members Seek Help

by W.D. Parks & Chet Walters

Copyright 1989 This article first appeared in the August NEO STAG News and may be reprinted so long as it is not modified in any way and this preface is included in the reproduction.

There's a trojan afoot in the Atari community! Beware! Write protect all your diskettes NOW! This trojan 'virus' spreads without any ill effects, unbeknownst to you or anyone who comes in contact with you, until it's too late! You can spread it as innocently as giving your friend a disk full of pics to look at. We have found this beastie on commercial disks, magazine disks, club disks and many more. No disk is safe. Check all your disks!

What first alerted the WWiz to the fact that "all was not right with the world" was when I wrote an executable boot sector to the floppy in drive A: with DC Formatter. The boot sector was to bypass the harddrive auto boot and execute the auto folder on the floppy instead of the one on the harddrive. I copied a few files to the disk and rebooted the machine. Alas! The executable boot did not work as advertised. So, I wrote the boot sector again. Again it did not work. Hmmmmm.... it always worked before. Let's get DiskDoctor to take a look.

Ok, the $60 BRAnch looks alright. The $38 offset looks ok. Let's see what's there. Yikes! This ain't no bypass! And why does the 'Dclick' that DC formatter always writes to the disk now say "00 00 00 00 c k"???? Hmmmm..... So, just for a lark, I ran a virus detector program and checked the disk. LO! A virus! Type 1. Known! Yikes again! There was something there overwriting the boot sector and spoiling the harddrive bypass routine. What?

In closer examination, we found a routine that is explained in greater detail later in this article. However, we must first emphasize that the programs mentioned above had absolutely NOTHING to do with the virus. They were as innocent as we. They were victims. This trojan is all too easily passed around.

All one needs do is boot with a disk infected with this virus and any disk placed in the drive thereafter will become infected whether it is read or written to and disks that need their own boot sector to work properly will be destroyed. If the drive motor spins for any reason — ESC pressed to update the window, a file copied to or from it, a program calls up the fileselector, just open the window — it gets infected. This trojan can spread rather quickly throughout your system, your club, your community in this way.

The virus itself seems only floppy oriented, infecting only floppy disks, but the KEY DISK might just do more harm to a harddrive than anything else.

I discovered the culprit late Wednesday night (7-26-89) but was very occupied Thursday getting ready for a short vacation so I had little time for an extensive investigation. I did, however, sound the alarm to the other members of the club.

In the limited time I did have, I found that nearly 50 of my disks were infected. Others of our club found more than that in their library, others not so many, but one fact is clear — it seems that *everyone* in NEO STAG is infected.

I spoke to a friend in Cleveland and mentioned it. He called me back an hour later and said he'd found numerous disks in his library infected as well.

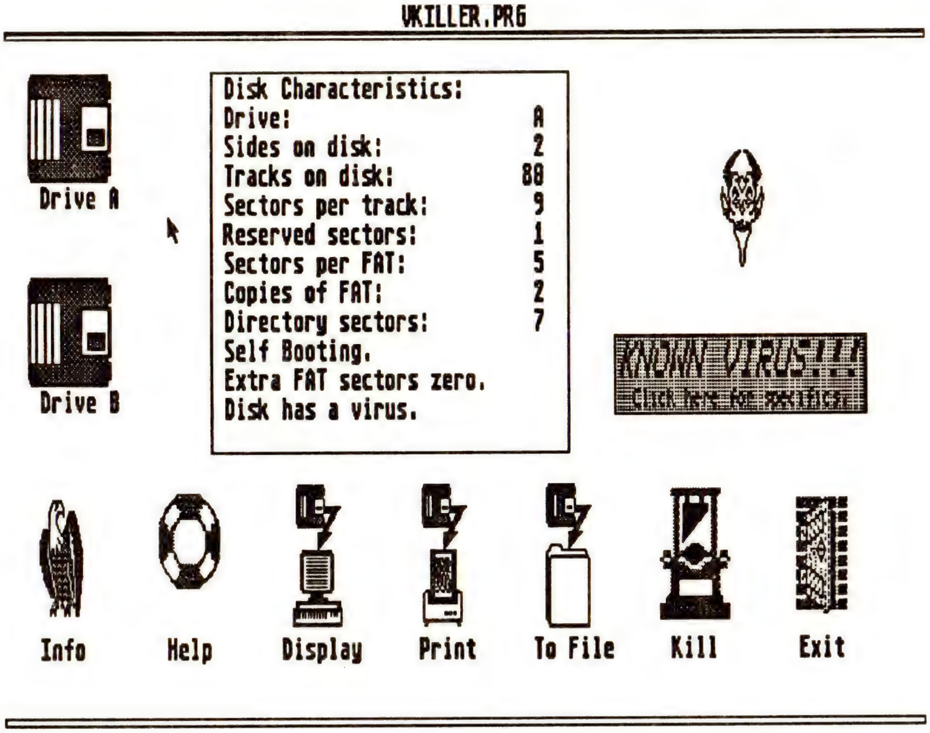
A friend of his had two disks from the WOA show in Michigan that were infected and the man insisted that he had not written nor read the disks without the write protect tab in place which means that the disks came from the show in their present ill condition. This little beastie may well be very wide spread and a real threat to the entire Atari community.

Whether this trojan is an old one that has resurfaced, or a new one that's newly circulated we can't tell. In perusing the reports from various members of our group, we seem to think that we first got infected here in early spring 1989. Judging from the disks infected and scouring our memory, it seems disks not placed in the drive since March or April are 'clean,' but many of those used after that time are dirty.

This is a standard trojan that spreads silently and waits for a key disk to set it off. We haven't found the key disk. We want you to help. Here's all the information we care to release about this little beastie (if we give out any more there may be some unscrupulous individuals at large who could create and spread their own variety of key disk for this trojan).

The lion's share of the digging was done by Dr. Bob. Because of his unique investigative skills and the fact that I was leaving for a four day hiatus at Virginia Beach, I turned the 'dirty work' over to him.

This Trojan program seems to have come into it's 'hazardous' phase. Dr. Bob calls this a trojan because that is what it is. It is not a virus. In Dr. Bob's inimitable



```
Disk Characteristics:
Drive:                    A
Sides on disk:            2
Tracks on disk:          80
Sectors per track:        9
Reserved sectors:         1
Sectors per FAT:          5
Copies of FAT:            2
Directory sectors:        7
Self Booting.
Extra FAT sectors zero.
Disk has a virus.
```

style of phrase: "A virus is a glorified term given to personify and to create a mystique for a simple off-color, fornicating device; to wit: a program that will damage your diskettes.

These kinds of programs do not deserve ANY public relations other than jail sentences. So let's snip the 'hero cult' where it can't have any offspring (preferably with something rusty!)"

Dr. Bob's findings: The Trojan program that we have here is sometimes called TYPE 1.

Identifiable Characteristics

At the very beginning of the boot sector the first 6 bytes are hex codes: $60,$38,$00,$00,$00,$00

The $60 .... BRAnch instruction of self booting disk (normal); the $38 .... tells offset to which to BRAnch (normal); the 4 zeroes.... There should usually be something! (abnormal)

NOTE: Many self booting disks or disks with executable boot routines built into them have the $60 $nn sequence as the first word of the boot sector. The $60 is a flag which tells TOS to execute the routine at the $nn offset in the buffer.

Disks with these codes are not always trojanized, they are simply boot-disks. Indeed, these are the very codes that alerted the VViz to the trojan since the second byte had been modified so the 'bypass HD' boot routine wasn't executing. The two trailing zero words (4 zero bytes) are the quick identifier of the trojan in this case.

Immediate Symptons

Few to speak of, other than all floppies get this auto boot sector written to them if the trojan is hooked into the system. It's a sneaky one, writing itself to all disks accessed in either floppy drive while you are unaware except that you might notice a slowdown in floppy access time.

The purpose of a Trojan is to duplicate itself on all diskettes and to wait for a key disk.

Day in the Life

This trojan is started by placing a diskette that contains the viral boot sector on it into drive A: and booting the machine which causes the trojan to wedge itself into the operating system's HDV_BPB vector... pointing that vector to itself.

Hence forth, any calls to read a new floppy will pass through this new vector. Hard-drive owners are not immune since the ST always reads the boot sector in floppy drive A: first and executes a 'flagged' boot sector that starts with the BRAnch instruction.

After it's 'hooked in', the trojan first calls the old vector then, before returning to say...the desktop or PageStream or whatever program accessed the disk, it will sneak a peek at the boot sector. If it doesn't find a $60 $38 as the first two bytes it then knows there's a 'clean' disk in the drive and proceeds to copy itself to that diskette's boot sector. This is done before the diskette has stopped spinning from the initial valid call so no one's any the wiser.

It then simply 'falls through' to the calling program which first accessed the diskette and all proceeds as normal. But the work is done! If the diskette accessed wasn't write-protected it will now have the trojan on it!

That's what it does if it finds no $60 $38 as the first word. However, if it FINDS the $60 $38 already there THEN we got some action going. It will check the diskette's 'identity' at offset 2 and later at 4 looking for the code $10 $xx (again, we won't tell you exactly what this 'ID number' is so there won't be anyone else making KEY DISKS for this trojan other than the original SOB that started it) immediately following the $60 $38. If it finds the $10 $xx it knows that: THIS IS THE KEY DISK!

It then goes through a little song and dance that can only be explained as "The Trojan's Author's need to check to make sure his routine worked." It checks the next two bytes also and compares them with itself. If the keydisk's number is larger than itself it acts!

Now...remember the identifying marks? 60 38 00 00 00 00? EVERYTHING is going to be bigger than 0000! Right? So why bother checking? I told you why! The programmer wanted to test it and not write over his own key-disk by accident....

What does it do now? That is a very good question. It does whatever the key-disk tells it to do since the key disk has an entirely different routine residing at the offset BRAnched to and THAT is where this little trojan jumps to when it finds the key-disk. It RUNS the key disk program (which appears to anyone viewing the diskette as though it were just another auto boot program; but now we know better!).

It could do something as innocuous as print a "hello world" message on the screen and return your system to you. It could also do something as harmful as zeroing all the directories on your harddrive!

So that's the key-disk to look for. It will have $10 $xx at the 3rd & 4th bytes in the boot sector (offset 2,3) right where the first two zeroes are on the trojan. It would look like:

$60 $38 $10 $xx $nn $nn

If the "$nn $nn" also contain zeroes then the key disk will be dormant.... maybe............

If you encounter the key disk, DO NOT erase it! Send us a copy so's we can dig in there and find out first: what this sucker is supposed to do when it executes and second: identify the SOB that started this thing circulating! Send to:

NEO STAG
PO Box 45
Girard, OH 44420.
You will be rewarded.

So, what do you do to prevent this virus spreading if you have it? You can, of course, get hold of a virus detector/killer program and examine all of your disks. We can't recommend a particular program for you because our bylaws forbid it.

You see, the members of NEO STAG will not purchase, donate for, publish the name of, nor support in any way any single virus detector/killer program on the premise that the author of such a program is not above first releasing the virus eradicator then subsequently releasing the actual virus the program is designed to detect and kill thereby creating a demand for the original virus detector/killer program.

That's that, though we can say that there are some out there that will detect and kill this trojan effectively. We can recommend you use a simple sector editor and look for the patterns described in this article. If you find the pattern, you can kill the trojan by writing a single zero byte to the very first byte of the boot sector.

However! Don't overwrite ALL disks that have the $60 as the first byte. If it's a known boot disk (game, executable boot, etc.) then DON'T overwrite that $60 or the disk will be destroyed. Look for the trailing zero bytes like you see in the illustration, then you can feel comfortable killing the virus with the zero byte.

The best way to prevent yourself from getting a virus is to always keep the write protect tab in the open position and always boot with a disk you know is clean. Again, if you find a disk with the 'KEY' sequence, make a copy and send it to us. We want to see it!

[Editor's Note: This particular "sleeper virus" or trojan horse seems to be near epidemic proportion in the ST community, with reports of the virus from many clubs in the U.S. and Canada. According to Jerry Cross, president of the Genessee Atari Group, their club library was found to be infected, and they contacted other clubs who have found this virus in their club libraries.

In checking our own personal library, we discovered a handful of disks that were infected with this particular virus! It is VERY important that you check ALL your disks to insure that they are virus free, and to check every disk you receive from outside sources. If you receive an infected disk, inform the person/organization you receive that disk from IMMEDIATELY.

If you have friends who own an ST and have not read this article, please inform them of this virus. We all need to share this information and work together to kill this virus before a "key disk" comes along that does real damage.]

Space Station Oblivion From Epyx

by Bob Retelle (MACE,WAUG)

This is one of those games with a really silly premise that turns out to be a very playable game in spite of the silliness. The scenario for the game tells you that the moon of your planet is threatening to blow up, due to gas pressure from below the surface. Your job is to explore the 18 different sectors and set up drilling rigs that will vent the gas and save the day.

Somehow, I don't think the idea of designing a game based around a planetoid that has gas would have ever occurred to me, but here it is.

You begin the game in a ground-based crawler equipped with a laser cannon and a transporter to teleport the drilling rigs from your home planet. Somewhere on the moon, in one of the sectors, is an air vehicle that will let you fly around and view everything from overhead, but it can't place any drilling rigs.

Each sector is named after a different mineral, such as Amethyst, Graphite, Obsidian, and so on. There is an optimum place in each sector for your drilling rig, but unfortunately, except for a very few sectors near the beginning, it's a guessing game as to where to place the drill. You CAN pick up the drilling rig and try again, but that action expends a large amount of valuable energy. Your score depends a great deal on how closely you guess at where to drill.

The graphics in the game are very nicely done. The cockpit of the vehicles is well detailed and colorful, and the landscape of the moon is done as filled polygon shapes. You can view the objects you encounter from all different angles and see their shapes change as your point of view changes.

Unfortunately, the sound doesn't measure up to the quality of the graphics. Most events are accompanied by one or another of the limited repertoire of beeps and bongs provided by the game.

Something I'm always picky about is the kind of controls a game provides. Happily, the vehicles in Space Station Oblivion have a versatile and easy-to-use control system. The mouse can be used for all movement and positioning of the vehicles or the keyboard cursor keys can be used for the main directional controls.

You have full control over rotating the craft around all three axes and raising or lowering its height. The distance travelled each time you click on "forward" can be set and changed, as can the angle turned when you rotate. You'll find situations when you need the utmost speed to get through dangers and other times when you'll need to creep along slowly and precisely.

The crawler and aircraft are armed with a laser that does double duty, both as a defensive weapon and to activate the various switches and controls in the sectors. Doors and other obstacles can be opened by shooting their controlling switch. Some sectors have devious puzzles which can make getting to the proper drilling site pretty tricky.

Switches in one sector can also control things in other sectors, resulting in a lot of trial and error searching through the sectors. The sectors are always the same every time you play, so the game is mappable.

On the other hand, this also results in having to play through all the sectors you've already solved to get to the ones that are giving you trouble. Happily, there's a Save Game option so you can save the game at your current position.

The laser sight is fast and responsive, and you'll need fast reflexes to take out the enemy laser cannon and orbiting platforms that appear suddenly. You can blast most of the things you see without any problems, and a lot of objects are worth points even though there's no particular reason why.

For example, if you watch the self-running demo in the game, it blasts a rectangle on top of a tall pole in the first sector. This target is worth something like 1000 points, even though it doesn't look any different from any of the other essentially similar rectangles in the game.

Your energy and shields can be replenished by finding and shooting two different kinds of crystals. The supply of crystals is limited, so you have to be careful not to waste energy or take too many hits from enemy lasers. You also have to be careful not to fall off the edges of the sectors or any of the high platforms and ledges you'll have to cross.

Space Station Oblivion isn't the kind of game you'll boot up and play over and over again, for months or years, once you solve the puzzles. It IS fun though, and complex enough to hold your attention until you do solve it.

Incidentally, while browsing at a computer store recently, I came across the same game in the "Imports" software section, with the title "Driller."

The Way the Other Side Sees Us

by Tim Holt (ST of El Paso)

First of all, let me give you some exact quotes from the July/August issue of INFO magazine, a magazine for the Amiga and Commodore computers. Please remember, these are all from *ONE* edition:

Page 13, under the column "Rumor Mill": *"On the topic of piracy, one big US Amiga software distributor estimates piracy in the Amiga market at 50% — he speaks of the 'Atari-ization' of the Amiga market...."*

Page 14, under the column "Show Report" a report on the Chicago COMDEX a picture of the STacy laptop and the following: *"Elsewhere, Atari took first place in the Vapor Hardware catagory, with the 'introduction' of the STacy, a laptop version of the Atari ST. The model they showed was under glass and looked like it had been put together with a hot glue gun just for the show. The LCD screen had horrible contrast but it makes little difference, since I would bet my Commodore Max Machine that no one will ever see one on a store shelf anyway. Not satisfied with a single new vapor product, Atari also announced a tiny hand-held PC clone called the Portfolio."*

Page 71, under the column "Summer Slump" the author gives a reason NOT to subscribe to Antic's Amiga Plus: *"Antic's Amiga Plus: Do you really want to get your Amiga information from an Atari publishing company hedging their bets at this late date as the Atari slides?"*

I don't know about you, but these three quotes made my blood boil! Atari slides? Vapor Hardware? Atari-ization of the Amiga market? It seems that the editorial policy of INFO magazine is to bash the Atari line of computers.

As a long time user of the ST line of Atari computers, I have been reading Atari-related magazines for a *long* time, and I have *never* seen an attack on the Amiga like I saw on the Atari in this issue.

The Amiga is a nice machine. One of my best friends has one. The Atari is a nice machine. I have one. I don't go calling my friend names just because he has an Amiga, and he doesn't call me names because I have an ST. We love to COMPARE what we both have, and whenever I go to Houston, he pulls out the latest AMIGA graphics and sound demos, tells me how it multitasks and has great stereo sound.

When he comes to El Paso, I whip out the latest ST graphics demos, show him how I can word process and download files at the same time, and play a few tunes through my MIDI keyboard for him. He leaves with his mind unchanged by my sales pitch, just as I leave with my mind unchanged by his sales pitch. We are still friends. We don't call each other names.

The INFO articles made me think. There are several explanations for an entire magazine to bash the Atari ST. Here are the ones I could think of:

1. The editors and staff of INFO magazine have poor informational sources. The STacy IS coming out. The Portfolio IS coming out. If the folks at INFO don't know this, then the people that gave them the information are poorly informed. I contend the piracy problem is *industry-wide*, not Atari specific.

If you look further into the issue of INFO, there is a regular feature called "COPY CORNER" (page 58), an article that tells you how to use copy programs! Atari pirates? I have never seen a "How to Copy Programs" article in ANY ST magazine.

2. The Amiga community is jealous of the ST and Mega line of computers. They are jealous that the Atari stock is now near $10 a share and rising. They are jealous that Atari is introducing and producing new and exciting computers, while other companies do not. Like a trapped animal, it seems as if the only response is to lash out at the predator. It seems as if Atari is doing some preying, and the prey looks trapped.

They are jealous of a laptop like the STacy, so they misrepresent it to the public. (Put together with a hot glue gun? ha!) They are jealous that Atari has a hand-held PC clone and Commodore does not.

Anyway, I just thought that you, as ST and Mega users should know how we are looked upon in the AMIGA community. Should you like to respond to these gross misrepresentation, address your letters to:

Benn Dunnington
Editor INFO Reader Mail
123 North Linn Street, Suite 2A
IOWA City, IA 52245

Mr. Dunnington "bet his machine" that there would never be a laptop ST...I wonder how we are going to divide that by a few thousand people???

Titan from Titus Software

by Bob Retelle (MACE,WAUG)

I always hate to write a bad review of a game. I've written games myself, and I know how it feels to put your time and energy into writing a game, especially one which has several fairly unique features. But sometimes things just don't come together no matter how unique the features may be. TITAN from Titus Software is one of those games. In a word it's, well, boring.

TITAN is somewhat similar to the Arkanoid/Breakout style of game where you bounce a ball against targets that disappear when they're hit. Like Arkanoid, there are many, many different screens with different layouts of targets and several varieties of targets, some good, some evil. Some targets have to be hit more than once before they disappear, and others change into something else when hit. So far, so good... I like games with a lot of variety in screens and targets (there are 80 screens in all). The graphics are also quite good.

To play the game, you bounce the ball off your "paddle," which in this game is square since you can hit the ball in any direction, not just up as in Breakout. If you're moving slowly, the ball simply rebounds off the paddle at an angle. If the paddle is moving more quickly, the ball passes through it and reverses its original direction. Unfortunately, the game uses the joystick to move the paddle, instead of the more quickly responding mouse. (The game also allows the use of the cursor keys to move the paddle, but that's such a ludicrous situation I won't even mention it!)

The screens consist of patterns of targets and obstacles. To complete a screen, you have to eliminate all the targets or hit the "EXIT" target. Some of the obstacles are completely solid, while some will let the ball pass through but block your paddle, and some are the reverse. Then there are squares that slowly rise out of the "floor" of the screen every time your paddle passes over them, eventually becoming solid obstacles. A few of the obstacles move around, causing the ball to bounce randomly, and just generally get in your way.

Of course, there are also the nasty targets that will do unfriendly things like kill you. If your paddle or the ball touches a white skull, you die. If the ball touches a green skull, you die. You can destroy the green skulls with your paddle, but you have do that while also keeping track of bouncing the ball.

So far, the game sounds pretty good. It begins to run into trouble though with the fact that the actual playing area is much larger than the screen area. This means that the screen must scroll around as you move your paddle to see all of the playing area. Because the ball moves independently, it may go off somewhere other than the area you can see, so there's also a "radar" indicator to show you where it is in relation to where you are.

Now, I like games with scrolling screens and radar indicators. It's just that those "features" don't work very well in this type of game. Because of the somewhat sluggish movement of the paddle, it's difficult to go chasing off after the ball when it disappears off your screen.

Another problem is that much of the time you may have to guard an area of skulls while the ball is off beeping and boinking against targets you can't even see. I don't know about you, but I like to see the action, not just listen to it happening somewhere off-screen.

This game makes it feel more like the computer's having the fun and you're just there to watch. The same "off-screen action" problem makes it awfully hard to aim at anything in the areas you can't see. You just have to hit the ball up there somewhere and hope it hits something. Aiming isn't all that accurate anyway, even when you CAN see the target. It seemed as if I was chasing the ball around rather than playing a game where the object was to actually hit a specific target.

If the ball gets past you, you may end up spending an awfully long time just trying to get it back to where you want it to be. There's an option to slow the ball down by pressing the spacebar or the joystick button, but that only makes it slowly frustrating instead of rapidly frustrating.

The game isn't all that difficult, except for the difficulties created by the lack of control and visibility. I easily reached Level 17 without dying before I decided I had better things to do with my time. The final straw came when the ball got past me for the second time and bounced its way back around a spiral maze that had taken me almost 10 minutes to painfully shepherd it through in the first place. Twice.

If you enjoy high levels of frustration or having the computer play the game for you, you might enjoy TITAN. Otherwise, I'd recommend you find a dealer who will let you playtest it first. You may find, as I did, that Arkanoid or even good old Breakout are more fun.

Millenium 2.2

by Tim Holt (ST of El Paso)

In the mid-seventies, there was a television series called Space:1999, where the commander of a base on the moon watched helplessly as the moon was blown out of the Earth's orbit, and the residents of the moon base had to fend for themselves. Pretty bad acting if I recall, but the IDEA was neat. Now, there is a game that has come out from Europe with a similar theme: Millenium 2.2.

You are the commander of a lunar base that is the last bastion of humanity. Seems as if the old Earth was wasted by a stray asteroid. Now it is up to you to repopulate the solar system. It won't be easy. There are only 100 folks on the moon, and the renegade human outpost on Mars decides that you are going to make good target practice. So, how are you going to do it? That is what Millenium 2.2 is all about!

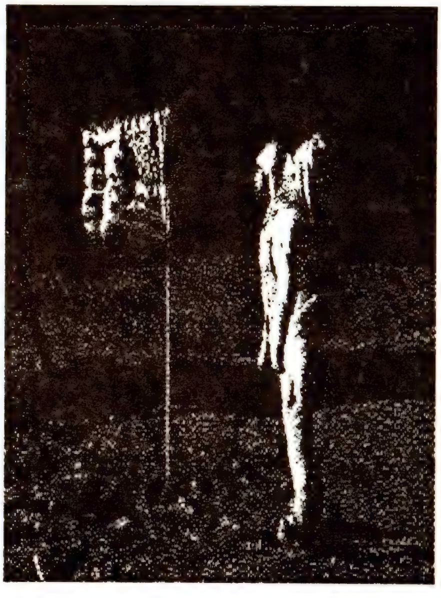
The moon base has six different areas that are under your command: research, energy production, industrial production, living quarters, the launch pad, and defense. By clicking the mouse on any one of these areas, you find out exactly what is going on at that moment.

When the game starts, energy and research are the most important areas, as the game progresses, production and defense gain in importance. All of the areas are important at one time or another, as you must constantly produce items such as energy cells, and must constantly research places where you can make colonies.

It is hard to tell about the game without giving away the secret to success. The ultimate object is to repopulate the Earth by producing a terraformer that can change the toxic atmosphere back into oxygen.

To do this, you must find certain substances such as silver, which are not available on the moon. These substances are available somewhere in the solar system, but you gotta find them. You find them by building probes, and sending them out to look for it. Once you find the stuff, you have to construct colonies there, so mining can take place. To get the items back to the moon, you have to build ships that can ferry the stuff from point A to point B. How you build your ship, and what you consider important is the key to the game. If you chose one thing as being more important, and it isn't, then doom awaits you.

All the while, Mars is attacking you, and your colonies, so you have to build defenses as well as regular ships.



It sounds complicated, and Millenium 2.2 is at first. The instructions are very skimpy, but I found that this ADDED to the tension of the game. I didn't know what was around the corner, and since the instructions didn't help, I had to use my head. (I am not used to this!)

The game switches from graphic adventure to arcade action whenever you are attacked, and that was a nice touch. The graphics are EXCELLENT. I won't spoil them for you. Go buy it and see for yourself.

I did have a few gripes about Millenium 2.2. Once you have finished the game, it is the same every time you play. It then becomes a race to see if you can beat your old time to repopulate the Earth. My best time is 18 years. Everytime you are attacked, the damage is done to the exact same type of equipment. I thought that was a bit unrealistic. The damage would be different each time in a real war. However....

If you judge a game by the amount of time you spend stuck in front of your Atari trying to get it done, then Millenium 2.2 has to be the most successful game I have ever played. I bought the game at 4 in the afternoon, and was stuck in front of my computer until 2 am. My wife threatened divorce during those eight hours, I think, I wasn't paying attention...

Great graphics, a nifty plot, and only minor complaints. Buy it, play it, become addicted, and when you are done, give it to your kids. Tell your wife it was an educational game (It really does have accurate information on the solar system in throughout the game.)...she might fall for it...

BEST Builds a Better Mouse
New Mouse Available for ST/Mega and XL/XE Computers

by Bill Rayl

I've never been totally satisfied with the design or durability of the ST mouse provided by Atari Corp.

On the design side, the ST mouse is a bit too large and oddly shaped for comfortable hours-long usage. As for durability, I've found from my own personal use that an Atari mouse, if cleaned on a regular basis, still ceases functioning properly in less than two years.

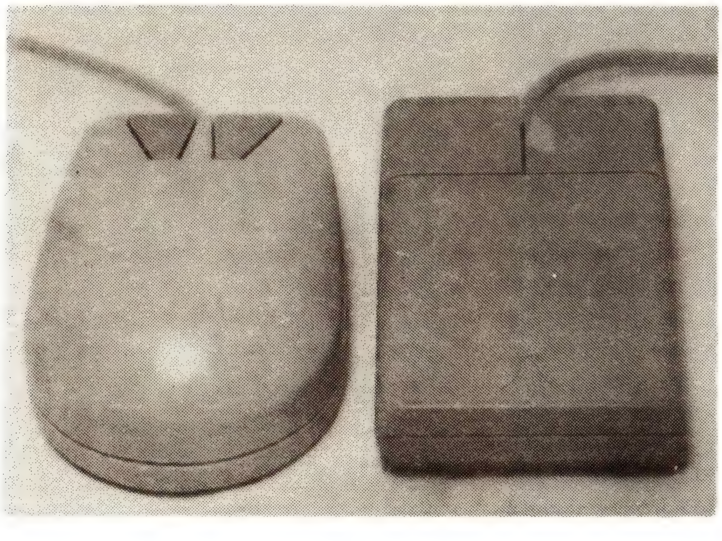
I consider myself an average to heavy user of the ST, putting in at least 20-30 hours per week in front of the computer. In the last three years, I have repaired or replaced the Atari mouse three times. Dungeon Master alone did one of the little rodents in!

Because of the almost constant cleaning, repairing and replacing of the mouse, I had a modified trackball added to my ST system. This solved the durability problem, but a trackball isn't the most comfortable thing to work with after a few hours either.

Add that to the fact that some operations are just plain easier to perform with a mouse than a trackball, and I was looking for a better alternative. I've used the MicroSoft(tm) Mouse on the IBM and I found its design and near maintenance-free operation to be far superior to my Atari's mouse. "Now why hasn't someone produced a mouse this good for the ST?" I asked myself.

Well, now someone has! BEST Electronics of San Jose, California has built a mouse that I believe even puts the MicroSoft(tm) mouse to shame.

Retailing for $49.95, the same price as the Atari mouse, the BEST Mouse is designed with the user in mind. From its sleek design that fits comfortably into your hand to the replaceable teflon "mouse feet" that make the device glide over your computer desk, the BEST Mouse is a joy to use.



No more cramped fingers and tired hands after a few hours of Desktop Publishing! The mouse buttons are responsive and quite firm — much better than the Taiwan- or Korean-produced Atari mice.

The BEST mouse boasts high resolution photo tracking of 200 pulses per inch, making this mouse approximately twice as fast and responsive as the Atari mouse. When using the BEST mouse, you don't need a mouse accelerator!

Not to be outdone by the exterior, a look inside the BEST Mouse instantly shows this mouse lives up to its name. The rollers that contact the mouse ball do not seem to be prone to the dirt build-up you get with the Atari mouse. No more scraping gunk off the rollers each month!

If you're an XL/XE owner using a GEM-like operating system such as Diamond OS, the BEST Mouse offers you an alternative to purchasing an Atari mouse. For a comparable price, the BEST mouse is truly the better buy!

Using the BEST Mouse on my spongy, cloth-covered mouse mat yielded less than satisfactory results. When used directly on my desktop, or on any hard surface, the BEST Mouse performed beautifully. This seems to be because the mouse feet actually lift the mouse slightly from the mat or desk surface, allowing the mouse to skate effortlessly over the desk. Using a spongy mat, the BEST Mouse simply isn't able to glide — sort of like roller skating on a carpet.

If your mouse is on its last legs or you're tired of the constant maintenance and repair of the Atari mouse, take a good look at the BEST Mouse. Chances are you'll decide the BEST Mouse really is the best mouse available for your ST/Mega or XL/XE.

For more information, see your local Atari dealer or contact BEST Electronics (408) 243-6950.

Atari Writer + for Those Who Don't Want to Read the Book -- Part II

by Jimmy Boyce (CACE)

Let's wind up the section on editing with some of those odd ball things that can save you some time and frustration. Like merging a file <pg27>. As editor of the CACE newsletter, I have to merge files a lot and this function has been of great help.

Merging Files Together

If you've seen the three column format of the CACE newsletter, you will notice that two or more unrelated items will fall in a single column. Since the number of contributing reporters has been growing, each article is saved on a disk as a seperate file. But, when printed they must be merged to fill a column. This is what I do to accomplish that feat:

First I load a file, and then I set the cursor to the end of the file with [SELECT][B]. Now, I press [OPTION][L]. In the lower right of the screen is the prompt: FILE TO MERGE. I type in the file name (if the file is on Drive 2, then I preface the file name with D2:) and type [RETURN].

That's it folks, I have just merged a file. When merging files, please make sure that you have enough free memory to make the merge (130XE owners — you cannot merge across memory banks).

Saving Blocks of Text

Another handy little option is the ability to save a portion of a file <pg28>. I don't know if you are like me, but on occasion I get to writing on the old 800 and forget that the file lengths are not as long as they are on the 130XE.

Next thing I know, I am stuck with a file that is too long to save. DO NOT PANIC! (I can say that because I did once, but now I don't.) Place the cursor at the beginning of the part you wish to save.

Remember when we talked about deleting blocks of text? Remember that command [OPTION][B]? Remember how you arrowed down using [CONTROL] [=]? Well that is what you do here until you have got enough highlighted text to make a shorter file.

"OK," you say, "what's next?" Try [OPTION][S]! Check out the lower right-hand side of your screen, it should read — FILE TO SAVE.

What I usually do is give my file a name and number (i.e., D2:TOOLONG1). Then I hit [OPTION] [DELETE/BK SP] and get rid of the saved portion. I repeat this process and save the next part as D2: TOOLONG2 and so forth, until my long file is all saved and I can recall it in logical sequence for hardcopy.

Additional Remarks

For 130XE people, here are a couple of notes: if you load up a memory bank press [START][B] to go to the next bank...you have two more available. It will save across banks and will reload to the same banks.

Let's say you need to add something to the middle of your file. Bank 1 is full, and that is where you need to place the additional information.

Try using [OPTION][F]. This command redistributes the file evenly across the three memory banks and leaves you space to make the insertion in Bank 1.

Put the cursor at the top of Bank 1 before you do it so you know where the cursor is when you are done. The first time I tried it, I had the cursor at the end of Bank 1 and finally found it at the end of Bank 3. Nothing serious, but it was unnerving.

Saving Text as ASCII

This next bit is kind of fun and interesting and, for serious writers or programmers, of great help. You can save your files in ASCII format by going to the Main Menu (by typing an [ESC]), pushing [CONTROL][S] and saving your file in the usual manner.

Now you can send this file via your modem to a friend with a different computer or a different word-processor, and they can receive it without the AW+ control characters. This will save them some time trying to unscramble your file. Make sure that you have deleted all AW+ global print format commands. These commands will screw up your file on any non-Atari program.

Programmers should save their files in the same manner, then ENTER the file into their compiler. Be sure to LIST your program. These files cannot be SAVEd.

Primarily AW+ files are compatable with any DOS 2.0 and 2.5 formated word-processors. So be it with editing. Bye for now.

[Editors' Note: The next installment from Jimmy Boyce will deal with spell-checking your Atari Writer + files. If you have any comments or questions, please share them with us.]

Spitting Image
Monty Python, Here I Come!

by Bill Pike (PAC)

[Review copy loaned by IB Computers. This article originally appeared in the Computer News, published by the Portland Atari Club and the Original Eugene Atari Computer Enthusiasts. Reprinted with permission.]

I was sitting down one evening in a generally foul mood and was sick and tired of the whole world. My generally foul mood was getting deeper so I decided to blow something up. Of course I went to my (Friendly?) computer.

I found something to cure my mood. It was a British game called SPITTING IMAGE. If you like British Humor or "the colonies" TV show "D.C. Follies" or "The Muppet Show" you will love this game. It is destined to become a classic for the ST.

The game package says, "Barry Manilow Free." On the back of the package you will find that "This game is guaranteed to contain no reference to Barry Manilow (except this one) (and the one on the front)."

There is also a "WARNING: DAMAGE" saying "A good way to really damage your cassette or disk is to smear marmalade all over it or leave it overnight in a bucket of creosote."

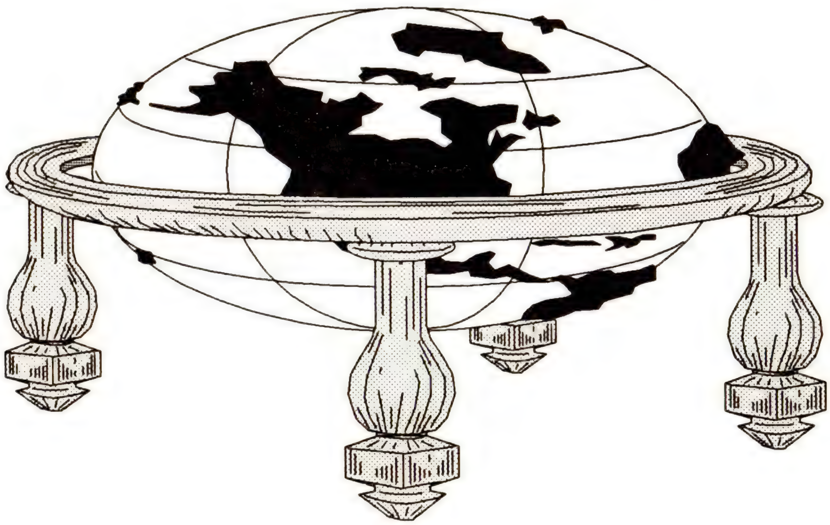
SAVE THE WORLD

Within the next seven years a world war will take place. A war so great that even the Swiss will get involved this time. A war so terrible the Italians have already surrendered.

One leader will emerge from this war to rule the world. It is your task to stop this leader and SAVE THE WORLD.

That is the title screen, and you are then shown a map of the world and the cursor will identify the various world areas for you.

You will also be shown your antagonists: Grovey Gorby, His Holy Coolness, Ms. T, Ronald MacRegan, Mr. & Mr. Ayotollia, and President Botha who is a very nice man (Report compiled under the South African Reporting Restrictions). You will also be introduced to Her Royal Reffness who will judge all contests.



Pick your champion, pick their antagonist and have at it. You have to defeat all antagonists, totally discrediting them. You will then have to face the Prince in a real mud-slinging contest. When you have successfully completed your task you will be shown who will rule the world.

Then, you are told what the instructions are. The game tells you, "This is the most confusing bit. Ronnie got completely lost here and even Maggie took 5 seconds to understand it." Anyhow, you also have a "sidekick" to help you if you need him/her.

The cost of this game is $37.95, why they don't just say $38.00 I still don't know. I know the cost is a might high, but the program is worth it.

This is the best program I have seen in a long time, however I do enjoy Monty Python. The graphics are excellent and watch the background scenes for some surprises during the combat sequences.

I spent about 3 hours playing the game when I first got the disk and this is a record for me. Even my 16-year-old son liked it. My wife hated it...she thought it was silly. She also thinks I'm silly, so take it for what it is worth.

P.S. If you get tired of playing against the computer you can also thrash your best buddy in a two player game. Ta!Ta!

For 520ST. 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with the tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

Upgrade your 1040ST or 520STfm just as easily as a 520ST! Send us your 520STfm and we will install the second bank of memory complete for only $269 plus shipping. Or install one of our 1040 memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes.
Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange the expensive 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

520A: Socketed, no RAM	$129
520B: 1 MB, socketed	$249
520C: 2.5 MB, socketed	$495
520D: 4 MB	$795
520-1: 1 MB, non-expandable	$199
1040A: 1 Bank sockets, no RAM	$110
1040B: Fully socketed, no RAM	$149
1040C: 2.5 MB + 1 bank sockets	$495
1040D: 4 MB	$795
1040K: Kit w/all parts, no RAM	$ 68

Clock Option on Memory Board	$ 30
Clock, stand-alone for 520/1040	$ 38

We ship COD ($3) or prepaid, sorry no credit cards!
Add the following amounts for shipping and handling:
memory upgrades - host adapters: 1st unit $5, add. u. $2
hard drive kits/CPU cases without drive $10/20, h. d. kits with drive need special shock resistant packacking $20/30
Texas residents add 8% state sales tax.

Above prices correct on 3-22-88. Prices of populated boards subject to chip adjustments to meet fluctuating DRAM prices.

520ST, 1040ST, 520STfm and MEGA are trademarks of ATARI Corp.

EXPANDABLE Hard Drive Kits:

All kits come complete with software and **all** parts needed to get the system **operational**, 1 year ltd. warranty. There are right now four different case styles available:

1. 10"wide x 6.8"high x 15"deep (desktop) with full SCSI interface and 'DMA-through' connector
-150 W PC power supply with fan
-room for up to 5 half-ht hard drives or combination - full/half height
-mounts on floor, under desk or on desktop
-can power up 520ST and external floppy drives.
-optional delay circuit for CPU allows fully automatic power-up!

No Drive--Install your own - $385
10 MB - $485 30 MB RLL - $695
20MB 48 ms - $595 40 MB ST251$795
30 MB f. ht. 45 ms autop. CDC - $745

2. 13.25" wide (same as MEGA) x 15" deep x 3.8"high with full SCSI/DMA through host adapter
-ready for up to 3 1/2 ht or 1 each full/half ht. hard/tape/floppy drives
-55 W power supply with 115V-fan
-can be placed under monitor

No Drives--Install your own $295
10 MB - $395 30 MBCDC - $565
20 MB 48 ms - $525 40 MB ST251$745
65 MB 22 ms autopark RLL drive $845

3. 4.5" wide x 6" high x 13" deep with single port host adapter
-ready for 2 1/2 height or 1 full height drive
-55 W power supply
-optional fan available (add $18)
No Drives--Install your own$249

10 MB - $349 30 MBRLL 48ms - $570
20 MB - $485 40 MB ST251 - $645
63 MB h. ht.22 ms auto parking - $795

4. CPU CASE, 18" wide x 12" deep x 8" high.
Upgrade your 520/1040 to the MEGA standard, separate CPU and keyboard, gain space for 3 each 3.5" and 5.25" half height floppy and/or hard drives in two separate drive bays.
* 150 W power supply with inbuilt fan supplies power for all possible combinations and keeps everything cool.
* a reset button on the keyboard makes a warm reset easy.
* an adjustable circuit delays the CPU on power up, allowing a totally automatic bootup.
* Your monitor can be switched on or off automatically, using an optional cable - complete **One** switch operation for the whole system is possible
* The plane immediately above the ATARI motherboard is reserved for future expansion. A 68020/68881-2 coprocessor board with sockets for up to 8 MB of high speed 32 bit memory is currently being developed.
Kit contains all parts for standard 520ST/1040ST/520STfm, please specify machine type - $295
Hard Drive kits for CPU case:
10 MB - $295 20 MB 48ms - $398
30 MB full ht. CDC 45 ms - $465
Please note that you get back about half of the CPU case costs after buying a Hard Drive Kit.
Host adapter cards are also separately available and come with software, either bare or with case and 6' long round shielded SCSI cable with embedded power supply lines. Up to 20' cable length and additional connectors, made to order available!
Two different types are available, both are full SCSI versions with DMA through connector, the higher priced one has also a real time clock.
Prices after the "/" are for host adapters with cas/cable..

$79/119 with clock - $119/159

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts is the Atari Club in and around the Jackson County area. The main purpose of the club is to help inform new users, and to promote the use of the Atari Computer in the community.

President	Brent Fisher	(517) 764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The C.A.C.E. BBS. is run by the club and is open to anyone with a modem. The number to call is 1-517-787-4011. The current membership dues are $14.80 per year, and are payable at any of the C.A.C.E. monthly meetings, or by mail to the P.O. Box. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter.

Any written communication with C.A.C.E. should be sent to: P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place in the basement of the East Side Lounge at 2214 East Ganson, Jackson, Mi.

Fishin' Around by Brent Fisher

Well, it seems that last month people tried to show up for the meeting, only to find a sign that stated that the East Side Lounge would be closed on Sundays during July and August. No one told me that we would not have a meeting place in August. And it seems especially strange since we did have a meeting at the Lounge in July. I would just like to take a moment to apologize to those of you who showed up after I had left, and hence I was unable to make other arrangements with you.

The next bit of business would be the late arrival of our issues of AIM. The editors and publishers of AIM are having a meeting with the principal contributing clubs on the 26th of August. I plan on being in attendance. Hopefully there I can work out something so that everyone gets their magazine on time.

Just so that everyone knows, this month's meeting is scheduled to take place on Sunday, September 10th, it most likely will be held in the basement of the East Side Lounge. I would ask that all interested parties show up as close to 1 pm as possible, this way just in case there is a problem with the meeting place, we can make other arrangements. If anyone has questions or comments, my phone number is published every month at the beginning of our header. By the way, I figure that it might be wise to tell everyone that the October meeting will be on Sunday the 8th, just in case he magazine comes late again.

Now for a bit of Atari news. I called and talked with Atari yesterday, and received some very interesting information. If you would like an inexpensive way to upgrade your disk drive, Atari has a plan for you. Send Atari your old 1050 and $75, along with a note stating that you would like to have a XF551 sent back in it's place. Oh by the way here's the exact address to send your drive, the note, and the money to:

Atari Corporation, Att: Customer Relations, 390 Caribbean Dr., Sunnyvale, CA 94089.

Now for some bad news for those of you who want to get Atari Planetarium, but it looks as though Atari has run out of stock on another good 8bit program. I was told that they have no immediate plans to produce another batch for us program starved hordes in the near future.

One last piece of news concerns Atari's executive revolving door process. It seems that Chris Roberts has left, so by the time you read this user groups will be dealing with another new user group co-ordinator. What does that make this, three or four this year? I don't know, I just don't know.

Anyway, it is time to get this off to AIM, so until next time, Come To The Meeting.

CAPITOL HILL ATARI OWNERS SOCIETY

CHAOS is the Capitol Hill Atari Owner's Society, serving the Atari community of the Lansing, Michigan area. The Campus Hill Atari Owner's Society is the Michigan State University chapter of CHAOS.

Membership dues are $15.00 per year and entitles members to a 1-year subscription to the Atari Interface Magazine, a free disk from our regular library, and access to our libraries and other resources. Dues may be paid at any CHAOS meeting or by mail. If not using an official membership application, please include your name, address, phone and a list of your equipment and interests.

Sysop John Nagy and CHAOS invite you to call one of the country's finest BBSes at 517-371-1106, 300/1200/2400 baud, 24 hours a day (Atascii/Ascii) serving both 8 and 16 bit Atari computers. Send inquiries regarding CHAOS, mail orders, memberships and so on, to:CHAOS, PO Box 16132, Lansing, MI 48901.

General meetings of the membership take place several times a year. 8bit and 16bit Special Interest Group meetings take place monthly. The S.T. INterest Group meets on the second Saturday of the month. The 8bit S.I.G. meeting, for 400/800 and XL/XE owners, takes place on the third Saturday of the month. Meetings begin at 10 a.m. sharp and last until 1 p.m.. Members and guests are welcome to any SIG meeting that interests them.

Illegal copying, or any violation of coyright laws, is not condoned or allowed at any CHAOS-sponsored function, including the club BBS.

GENESEE ATARI GROUP

Serving the Flint area

The Genesee Atari Group is a non-profit group of Atari owners in and around Flint, Michigan. Our purpose is to provide assistance to users of Atari personal computers. This organization is not affiliated with Atari, Inc.

GAG meets on the second Wednesday of the month at the Neithercut school, located at 2818 Crestbrook Drive, Flint. (Off Atherton between Hammerberg and Van Slyke). Meetings begin at 6:30 pm. All are welcome. GAG is a participating member of the Atari Interface Magazine, and members can purchase subscriptions at a greatly reduced rate. GAG is also affiliated with the Great Lakes Atari Digest, and members receive a free subscription with their membership. Membership is $15 per year for the family.

GAG has an exceptional public domain library of 8- and 16-bit software. Contact one of the officers to receive a complete catalog. GAG also has a large magazine library for use by it's members, including Antic, Analog, ST-Log, Start, and several others. We do not support piracy, Piracy is theft!

For more information contact:

GKAUG ATARI

GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets on the second Saturday of each month at 11 a.m. in the Dewing Hall, Room 305, on the Kalamazoo College Campus, corner of Academy and Monroe. Dues are $25/yr and include a subscription to Atari Interface Magazine.

President	Frank Fellheimer	657-6106
Vice President	Dan Youngs	
Treasurer	Open	
Archiver	Dave Oldenburg	
Librarian	Bill Berner	
SysOp	Alex Stevens	
GKAUG BBS		(616) 657-2665

Next meeting: Saturday, 09 Sep 1989

We managed to get reservations for room 302 again, but we will be making a final decision at this next meeting if we will be going to Star World for our next meeting in October. The decision will be in October's AIM if you don't happen to make it to the meeting.

It looks as if I will be able to handle the next year as President. I am back to work in my own area. If I don't have to work the overtime, I will be at all the meetings.

Next meeting:

- Discussion of Star World Meetings
- Richmans 80 column word processor: if it comes in.
- 1020 Plotter demos: they are so inexpensive to own now.
- General Discussion: Lots of new items to bring up.
- Looking for officers: it can be you.

See Yah, Frank

Great Lakes Atari ST Support — 'GLASS', Michigans only 'ST' only Users Group I ♥ my ST!

Meetings - First Thrusday every month, 6 p.m. to 9:30 p.m., Athens High School, 4333 John R, Troy, Mi., 1/10 north of Wattles <17 Mile> - Room 1528 - Mailing Address - P.O. Box 99737, Troy, Mi. 48098 Phone - (313) 828-1653 after 4 p.m. - Steve Mileski, president

Dues - $1.00 per month, ie:join in April - pay $9.00, all memberships expire on January 1, each year. Non-members welcome at no charge.

For Sale:
Each only $15

Terry Reine	Membership	(616)698-7244

President's Monthly: 17 August, 1989

Hi all, it is good to be back at the keyboard after a prolonged absense.

How have you all been since my last entry? I hope you have had a good a summer as I have. My computer useage the past couple of months have been on a PC trying to get several C.N.C. (computerized numerical control) machines all hooked up to a single PC to allow the use of a new CAD/CAM package. There are still a couple bugs in some of the connections, but all in all the system works well.

Now to old trusty... My Atari has had it very easy this summer, but now that things are slowing down, I hope to give it some of those long workouts that keep it (and me) active till all hours of the night.

I have not bought anything new so far this summer with the exception of a second XF551 drive, so I don't have to much to share with you until I get back into the swing and find out what all you have been doing and any new pieces that you've added to your collection.

Shortly after the September meeting, I am planning an officers meeting to get some sort of agenda for upcoming topics and demos. If you have any ideas for the demos, or have something new that you would like to demo, let me know about it and we'll try to get it in. Let's not be shy, I am sure that many of you have items that would make great demos.

One more item, Terry Reine has moved to Ohio. He has taken a promotion into the marketing field of the retail company that he works for. Good luck Terry, we wish you every success in your new job.

This leaves us in need of a new Membership Chairman. If anyone is interested, get in touch with me and the job is yours.

Come to the October meeting

Tim

M.A.C.E. MACE MICHIGAN-ATARI-COMPUTER-ENTHUSIASTS

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Bill Rayl at (313) 973-8825 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)
MACE East	(313)978-1685	(3/1200)

Molin's Den	(313)420-0407	(3/1200)

August Meeting Minutes

The meeting got off to a late start, with the night's first order of business dealing with Jerry Cross's loss of equipment at the Michigan Atari Computer Expo. After a lengthy discussion, the majority of members present voted to reimburse Jerry for his insurance deductable.

President Bill Rayl and Meeting Coordinator Bob Retelle then lead a discussion of recent events in the Atari world. They talked about the Atari revolving door, talked about a ST virus epidemic and the cancellation of prominent AtariFests on the West Coast.

Bob Retelle then talked about the upcoming elections in September and named those lucky MACE members who have been (unknowingly) nominated for officership. Remember, MACE needs your help to keep the club alive! (Volunteer before you are volunteed!) Nominations so far include: Bill Boles, Jim Samples, Kip Keifer, Harry Price, Gordon Totty, Bob Retelle, Brian Wilmoth and Frank Alexander.

Next on the agenda was a talk about hard drives from ST Librarian Ed Hanson. He talked about the utilities available for hard drive owners like FatSpeed, Turtle, Unturtle, DL2 and T_restore. These public domain files are available in the MACE ST library; they are disks U28 and U33.

The next meeting is September 19, and we will have a guest speaker from MichTron!

ST CLUB EL PASO

The ST Club of El Paso is the only Atari ST and Mega user group in the El Paso area. Founded in 1988, The ST Club has distinguished itself as great help to those that are new to Atari computing as well as helping those that are old "hacks" at computing.

Meetings of the ST Club are held on the second Saturday of each month at the Richard Burges Branch Library, 9300 Diana. Meeting time is 12:30pm. Each meeting features demonstrations of the latest in software, and help for those that are having problems with particular programs.

Membership in the ST Club of El Paso includes the following benefits: A one year subscription to Atari Interface Magazine, discounts on computer supplies and software at Jenkins' Computer Store, discounts on services at local merchants, access to a huge PD file area, access to the ST Club area on STEP BBS, technical assistance, regular club auctions and social events. Voting membership is only $20 a year! (A great deal, when you consider that a subscription to AIM alone is $18!) Sponsored memberships are $15 a year, and newsletter only memberships are also $15.

To become a member of the ST Club of El Paso, call 915-821-2048, or write to: The ST Club of El Paso 10953 Yogi Berra El Paso, Tx 79934.

President:	Tim Holt	(915) 821-2048
Vice President:	Morris Miller	594-1906
Sec't/Tres:	Joann Anderson	751-2710
Editor:	Paul Stampfli	821-4861
Librarian:	Norm Bates	593-6234

From the Prez...

I hope that you noticed the changed look of our newsletter! The members decided at the August 12 meeting to adopt Atari Interface as the official newsletter of our club. I think this gives us a more professional look and takes a burden off Paul. So, let me know what you think of our new "baby" at the next meeting.

Here is a quick rundown of what happened at the August 12 meeting: Paul Stampfli demo-ed HABA's Home Accountant. Probably the only decent program that came out of that defunct company. (I know, the program is old, but it is really neat!)

The club business discussed included: Adoption of AIM as our newsletter, possible second meeting per month (this looks like it might be the last Tuesday evening of each month, or possibly just SIGs meeting at various people's homes), selling raffle tickets for the $50 gift certificate to Jenkins' (drawing to be held at the September meeting), newsletter was distributed, the two new types of membership rates (sponsored and newsletter only), and a discussion on what the club wants to see in the future.

Four new members joined at the August meeting: Clarence Klaassen Jr., Billy Corbett, Mike McCown, and John And Pat Hawley. We wish to welcome them to our club.

The September meeting will feature a demonstration/lesson of how to run ArcShell 1.99, as well as a new game. Arcshell is a very important program for the ST, and if you are new to the club and the Atari, this is the meeting to be at! The raffle for the $50 gift certificate will be drawn, and the door prize this month is the latest album by Tangerine Dream, composed entirely on the Atari ST. I hope all of you can make the meeting September 9th.

Until next month, enjoy the new newsletter! Tim

TINKER ACE OF OKLAHOMA

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at Route 5, Box 539, Blanchard, OK 73010 or at the TACE BBS (405) 755-9561, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Correspondence - $15.00.

President	Michael Beard	(405) 793-7978
Vice President	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Greg Yelle	(405) 390-9184
BBS SysOp	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649

Secretary/Treasurer Report–July 1989

Okay folks, this was one of the most exciting times of the year. The volunteers for the various offices were pressed into service!

And here they are...

Greg Ray volunteered to be the President for the next year, Ron Hamilton volunteered (was volunteered?) to be the Technical Advisor (you would have called him for all those little problems anyhow...), Chris Hamilton is the new 8-Bit librarian, the vice-president is doing a repeat performance, and me as Secretary/Treasurer.

The new address for all Tinker A.C.E. correspondence is:

104 E. Northrup
Midwest City, OK 73110-5226

SpartaDOS X was shown at the meeting and no bugs were seen beyond those explained in the documentation.

Don't forget, Tinker A.C.E. dues ar now due (of course, if you are reading this, you probably have already payed them), the dues are prorated at $1.25 a month for correspondence membership and $1.66 a month for full membership.

August — Nice meeting

Both president and vice-president brought their ST's as well as one 8bit.

A survey was taken by Greg L. Ray as regards the club...he also gave out a printed copy of all the many Print Shop (tm) icons that he personally has.

We are currently payed up on all bills (except Puget Sound Atari News) at this time.... If you want a subscription to Puget Sound Atari News, you may get it through the club (me) for $ 1.08 an issue.

Please encourage your friends to come to the next meeting, we should have a demonstration of the Express cartridge (by Keith Ledbetter) by Advengar of Timewarp BBS at the September meeting (which, by the way, should be the second Saturday of September, rather than the first Saturday).

Stephen C. Moffit

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the last Saturday before the 18th of the month, at 2pm at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township. Upcoming meetings are September 16th, and October 14th, 1989. Officers:

President	Steve Volker	(517) 793-2955
ST Librarian	LeRoy Valley	686-6796
Treasurer/Sec'y	Marty Schmidt	792-6029
8 Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's PD library, along with a year's subscription to the Atari Interface Magazine. Check your mailing label, if you need to renew,(or haven't joined us yet!), DO IT NOW!

First Up

I would have to guess that ever since the days of 1K, gaunt, keyboardless computers, whenever a group or 'club' of individuals had agreed to come together on a regular basis, the president or chairman of that group invariably found it necessary to "chastise" the members for poor attendance records. (Especially during the summer months.) I would also hazard a guess that very few of these impassioned pleas were the least bit effective, so I think I'll skip mine. One small point though. I think it is interesting to note that the number of topics discussed at the August meeting outnumbered the number of members present. Hmmm...

Remember! Re-Up, then Show Up!!

What You Missed

Listening to LeRoy Valley demo a LAZER 'C' debugger, doesn't necessarily sound like the most exciting way to spend an afternoon, but even a program-specific tutorial, in the hands (and mouth) of an expert, can be very entertaining. Especially with the little side remarks and devastating mini product reviews which seemed to spring up unbidden as Mr. Valley deftly takes whatever application he is demoing through it's paces. No one walks away without learning something.

The tabled discussion on how much to charge for copies of club disks was reopened this month. After a brief flurry of comments and suggestions all around, a motion was brought to the floor by LeRoy Valley, that the cost for DS disks should be $5 per and the cost of SS disks should be $3 per, for disks purchased from the club with library software on it. Bryant LeFreniere seconded and the motion was passed.

Bryant also confirmed that he would be demoing Migraph's Touch Up and Hand Scanner combo, at the October meeting. He said anyone who wishes to bring something in to be scanned into an IMG. (like old photographs, hand drawings, etc.) should feel free. He will try to get to everyone.

The Forum on membership drives will be reopened at the September meeting. A number of negative comments were heard about AIM's recent inability to get us our "newsletter" on time (i.e. before the meetings), and also in reference to the seemingly counter-productive denials, explanations, and defensive rhetoric which have continued to fill the pages of the magazine, almost since it's inception, concerning the split with John Nagy et al. It is suggested that you make a point to attend the next few meetings, in order to have a voice in any upcoming decisions that may have to be made.

(Presidential Note: There is a General Order meeting between the AIM's staff and participating Users Group representatives scheduled for the 26th of August in the AIM offices. Topics to be addressed are magazine content and club participation, among other things. Our concerns will be voiced at this meeting also, and a full report will be presented at our next meeting.)

What You Shouldn't Miss

Steve Volker will be showing off SHADOWGATE by ICOM Simulationsand MINDSCAPE, and explain why it is a Moral Imperative to own this game! (By the way, what IS that THING on the front of the box? Look for a demo of Fast Technologies new 16 mhz upgrade board soon, and see CMI's version, with a socket for the BLITTER chip, in person! (And For Sale?) The 8bit section is on hold temporarily, until some 8bitters, besides Ted Beauchamp, decide to SHOW UP!

BOTH MasterCad (by Michtron), and Speller Bee (by First Byte), are available for members who wish to take them home and explore them for a month. Ask STEVE or LEROY...

On Another Note

The Fall Consumer's Showcase at Fashion Square Mall will be coming up soon, and we've been invited! We need to start making a list of volunteers who will bring and man their machines at this event. LET'S HAVE A GOOD SHOWING!

Equipment Volunteers for September:
Steve Volker - ST System
Ted Beauchamp - 8 Bit System
Remember, if your bringing equipment, please bring all necessary cables, (i.e. power cords, monitor cables, mouse, or whatever.)

Looking for Public Domain Software? MACE has it!
Over 300 disks in the ST Library and 400 disks in the 8bit Library!
Only $4 each for ST and $3 each for 8bit Disks!
MACE PO Box 2785
Southfield, MI 48037

The August meeting was held Tuesday, 8/8 in the Wolverine Room at the Michigan Union. President Craig Harvey called the meeting to order promptly at 7:30pm, as promised. He immediately suggested that intermission take place at the beginning rather than the middle of the meeting so he could dash home and get his ST monitor since there was no telling when V.P. Rick Schrader would arrive with the club monitor.

Guest speaker Ed Hanson, of Hurricane Systems, hosted a very informative discussion about hard drives for the ST. Ed described the various hardware/ software options available to persons who wish to assemble their own system, and then went on to show some of the formatting/partitioning software from ICD.

Member Mike Pieronek described some of the pitfalls of installing a hard drive internally in his Mega 2, and then proceeded to show how well it worked while running the Spectre 128 Mac emulator. The ensuing Q&A session was quite lively and eventually ended with a discussion centering on the uncertain release of TOS 1.4 for the end user.

Craig announced the September meeting feature topic will be "Utilities" and October will be "Emulators" where we will be showing the Spectre GCR and PC Ditto II (assuming they are available by then).

Mike Pieronek noted that he had tried to order his Spectre GCR earlier in the day and had been told that orders were only being taken every other day and that he'd have to call back again! Who would have guessed that Gadgets By Small would have gotten so finicky about taking money from the adoring public?

ST Librarian Russ Crum announced a new update to the catalog disk which may be purchased for $2 or traded for a previously-purchased disk. Russ also had a special package of two disks containing a variety of hard-drive-related items from formatting programs to 40-folder-fixes to backup and restore systems.

8Bit Librarian Mike Millage had some bundles left over from previous meetings and also announced a new catalog disk would be available at the October meeting. There are now nearly 240 different disks available in the 8Bit library.

The meeting was adjourned at 9:30pm.

Michael Olin

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

DigiSound ST

● ● ● ● ● ● ● ● ● ● ● ● ●

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

● ● ● ● ● ● ● ● ● ● ● ● ●

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC**, and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs DIGISPEC!

Only $39.95

Polydisk

Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

BRAND NEW ITEMS

$\$199^{95}$ The "BLACK BOX"!© $\$199^{95}$

The **Black Box** is a device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It has two buttons, two switches, and a set of dip switches visible from the outside. It plugs directly into the back of the 600XL, 800XL, and 130XE computers. Custom cases may be an optional expense. The **Black Box** performs three main tasks: interface to a SASI/SCSI bus device (hard disks), Parallel printer port, and a RS232 port. A fourth option, available soon, will be a floppy disk port, especially useful to XF-551 owners. The SASI/SCSI port provides the necessary signals for hooking up most common hard disks. You may partition your hard disk into as many drives as you wish; up to 9 can be accessed at at time. By pressing one of the buttons on the **Black Box**, you will enter the configuration menu, where you can re-assign drive numbers, etc. When you exit, you will be right back in the program you were running when the switch was pressed. Each hard disk can be write-protected. The Parallel Printer port will allow you to hook up any printer that uses the standard Centronics interface. As an option, you can use the computer's extra memory as a printer buffer, or order the **Black Box** with 64K of on-board RAM. You may assign printer number and line-feed options within the menu (for use with multiple printers). Another amazing feature of the **Black Box** is the built-in screen dump. By pressing a button (on the box), the contents of your screen will be dumped to your printer (you can define text or graphics modes with a switch)! The RS232 port supplies the full RS232 spec signals for connection to a modem, or another machine (for null-modeming). The handler for the **Black Box**'s modem port is built in and takes up NO memory! The port handles rates up to TRUE 19.2K BAUD! A future upgrade for the **Black Box** is a floppy disk interface board. This will allow the addition of up to four 5.25" or 3.5" mixtures of floppy drives to be used with the system. The drives will act like standard single/enhanced/double density disk drives, but MUCH faster! All drives will be Super Archiver compatible, and support up to 2 sides of 80 tracks. Along with this hardware upgrade will come software capable of reading, writing, and formatting disks in IBM's MS-DOS format and the Atari ST format, and allow you to transfer files between those disk formats and the Atari's format. In addition, a machine language monitor has been added to allow memory disassembly, memory/register changes, and more. The Price of the **Black Box** is $199.95 for the basic unit and $249.95 with 64K of RAM (for printer spooler) plus $8 for S/H/I.

$\$199^{95}$ The "MULTIPLEXER"!© $\$199^{95}$

This device brings the power and flexibility of larger systems to your 8-bit. The **Multiplexer** is a device (actually a collection of modules) that allow up to 8 Ataris to read and write to the same drive (typically a hard disk), printer, and talk to each other. One 'master' computer (any 8-bit) is equipped with the master **Multiplexer** interface. Then up to 8 'slave' computers can hook up to the master, each having their own slave interface. The 'common' peripherals (things that are to be shared) are connected to the master computer. On each slave, all disk and printer I/O is routed through the master, so no drives are needed on them. The master computer can be configured in any manner you wish - you can for example have certain peripherals 'local' to the slave, or routed to a different number on the master. Under development is a BBS system that will make full use of this device, allow ing up to 8 lines/users to be using the system at the same time! A multiuser chat mode is a feature of this program, however, you do not NEED this program to run a BBS with the **Multiplexer** (but be warned that not all BBS programs will run concurrently). All slaves are independent, and do not need to have the same program running on them. This system is excellent for BBS SysOps, because you can be using your hard disk(s) while still running your BBS uninterrupted! Another example is in a classroom situation, or anywhere a disk needs to be shared by different people. This is an EXCELLENT programming/debugging tool as well! The **Multiplexer** price is $199.95 for a master and two slave units (plus $5 S/H/I). Additional slave units are $69.95 each.

$\$149^{95}$ The "SUPER E-BURNER"!© $\$149^{95}$

This device plugs into your Atari's cartridge port, allowing you to program PROMs or EPROMs. (EPROM stands for Erasable Programmable Read-Only Memory.) A PROM is a type of integrated circuit that will store information permanently. This is what is used in cartridges, and even in the computer to hold the operating system program. The **'Super E-Burner'** will program the following chips: 2732, 2764, 27128, 27256, and 27512 PROMs/EPROMs, with any suffix. The burner will let you make multiple copies, read data, burn from a file, etc. but does so EXTREMELY fast! It can fully burn and verify a 27128 in 15 seconds. Also under development is a gang-burner module for the **'Super E-Burner'**, allowing it to program up to 8-chips at a time, with this same insanely-fast speed! The **'Super E-Burner'** sells for $149.95. A deluxe version capable of programming 1 MEG EPROMs is available for $179.95. Add $5 for S/H/I

$\$99^{95}$ The "POWER PLUS"!© MEMORY UPGRADE $\$99^{95}$

(for 800XL'S and 130XE's only)

C.S.S. has made the **'Power Plus'!** memory upgrades available on an "unadvertised" basis to our regular patrons. These upgrades have become so popular we are now making them available to everyone! For those of you unfamiliar with **'Power Plus'!** upgrade, it is the most COMPATABLE upgrade available for the 800XL or 130 XE. All other upgrade kits have some degree of INCOMPATABILITY with certain software programs. C.S.S. studied this problem and developed the **POWER PLUS** upgrade which, to the best of our knowledge, appears to be 100% compatible. To upgrade a 130XE to 320K is only $99.95. To upgrade an 800XL to 320K is only $149.95 (circuitry from a 130XE is actually transplanted into the 800XL). Add $5 for S/H/I. C.S.S. will install these upgrades for only $20 if you wish.

$\$39^{95}$ The SIO "POWER BOOSTER"!© $\$39^{95}$

Weak data signals are often the problem of errors in data transmissions, especially when working in High or Ultra Speed modes! Long cables, modems, interfaces, and other devices that draw their power from the computer rather than having their own power supply often degrade the waveform of the signals between your computer and other peripherals, sometimes resulting in errors. The **SIO Power Booster Cable!** will amplify the signal to and from your computer 20 to 100 times providing perfect square-wave data transmissions regardless of peripherals used. The **'SIO Power Booster' Cable!** looks like a standard SIO cable and simply plugs into your computer! Only $39.95 plus $5 S/H/I.

BEST SELLERS

$\$69^{95}$ The "SUPER ARCHIVER"!© $\$69^{95}$

(for ATARI 1050 drives)

The new **SUPER ARCHIVER**, obsoletes all copying devices currently available for the **ATARI 1050!** It eliminates the need for Patches, **PDB** files, Computer Hardware, etc. Copies are exact duplicates of originals and will run on any drive; without exaggeration, the **SUPER ARCHIVER** is the most powerful **PROGRAMMING/COPYING** device available for the 1050! Installation consists of a plug-in chip and 6 simple solder connections. Software included. Features are:

- **TRUE DOUBLE DENSITY**
- **ULTRA-SPEED** read/write
- **FULLY AUTOMATIC COPYING**
- **SUPPORTS EXTRA MEMORY**
- **SCREEN DUMP** to printer
- **TOGGLE HEX/DEC DISPLAY**
- **SECTOR or TRACK TRACING**
- **AUTOMATIC DIAGNOSTICS**
- **DISPLAYS HIDDEN PROTECTION**
- **ADJUSTABLE/CUSTOM SKEWING**
- **AUTOMATIC SPEED COMPENSATION**
- **AUTOMATIC/PROGRAMMABLE**
- **PHANTOM SECTOR MAKER**
- **ARCHIVER/HAPPY ARCHIVER**
- **COMPATIBLE**
- **BUILT-IN EDITOR**-reads, writes, displays up to 35 sectors/track short
- **BUILT-IN CUSTOM FORMATTER** up to 40 sectors/track
- **BUILT-IN DISASSEMBLER**
- **BUILT-IN MAPPER**-up to 42 sectors/track
- **DISPLAYS/COPIES** Double Density **HEADERS**
- **AUTOMATIC FORMAT LENGTH CORRECTION**
- **SIMPLE INSTALLATION**

The SUPER ARCHIVER is so POWERFUL that only programs we know that can't becopied are the newer ELECTRONIC ARTS and SYNFILE/SYNCALC (34 FULLsectors/track). If you want it ALL...buy the "BIT-WRITER"! also... then you'll be able to copy even these programs! Only $69.95 plus $5 S/H/I.

JUST RELEASED

$\$99^{95}$ The "SUPER ARCHIVER II"!© $\$99^{95}$

(for ATARI 1050 drives)

NOW! **COPIES** all **ENHANCED DENSITY** programs plus retains all of the features of our World Famous **SUPER ARCHIVER!** (see above). Allows you to **COPY** or **CREATE** single or **ENHANCED** density protection schemes (including **PHANTOM SECTORS!**). Completely automatic; compatible with the **BIT-WRITER !**; the **ULTIMATE BACKUP/PROGRAMMING** device! Only $99.95 plus $4 S/H/I. **NOTICE!** If you already own a **SUPER ARCHIVER!**, you can upgrade to a **SUPER ARCHIVER II** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$\$69^{95}$ The "ULTRA SPEED PLUS"!© $\$69^{95}$

Imagine a universal XL/XE Operating System so easy to use that anyone can operate it instantly, yet so versatile and powerful that every Hacker, Programmer and Ramdisk owner will wonder how they ever got along without it! Ultra Speed Plus puts unbelievable speed and convenience at your fingertips. Use **ANY DOS** to place an **ULTRA SPEED** format on your disks, boot any drive (1-9) upon power-up, format your **RAMDISK** in Double Density, activate a built-in **400/800 OS** for software compatibility, plus dozens of other features too numerous to mention! Below are just a **FEW** features you'll find in the amazing OS:

- **ULTRA SPEED** SI0 for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from **RAMDISK**
- Special timer circuits not required for 1 or 2 Meg upgrades
- Background colors adjustable
- Reverse use of **OPTION** key
- Cold-start without memory loss
- Built-in floppy/disk configuration editor (1-9)
- Built in **RAMDISK** configuration editor(1-9)
- **RAMDISK** exactly duplicates floppy drive so sector copying and sector editing are now possible
- Built-in MINI Sector Copier
- Toggle **SCREEN OFF** for up to 40% increase of processing speed
- Toggle internal **BASIC**
- Ram resident disk loader program (**MACH10** menu)
- **DOUBLE DENSITY RAMDISK** capable
- Entire **MEMORY** test that pinpoints defective **RAM** chip
- Boot any drive (1-9) upon power-up or cold-start
- Supports memory upgrades up to **TWO MEGABYTES**
- **THREE** Operating Systems in one (**XL/XE, 400/800, ULTRA SPEED PLUS**)

$\$39^{95}$ The "RICHMANS"!© $\$39^{95}$

80 Colum Word Processor

Easy to use, very **powerful**, and **NO ADDITIONAL HARDWARE** required! Works with TV or Monitor! This **"DISK ONLY"** 80 Column Word-Processor is simple to use while offering numerous features such as:

- Completely Menu driven
- Self contained DOS
- Complete Text formatting
- Built-in Printer Drivers
- Page numbering
- Justify and Endfill
- High speed Cursor
- Spell Checker
- 80 COLUMNS ON THE SCREEN!
- Insert and Delete
- Search Mode
- View only mode
- Memory Statistics
- Alternate Output
- Change screen Colors, borders, luminesce
- Mouse compatible
- XEP-80 Compatible

One expert has compared 40 domestic and foreign word-processors and concluded that the RICHMANS 80 Column Word-Processor is the best! Only $39.95 plus $5 S/H/I. (64K required).

$\$79^{95}$ The "BIT-WRITER"!© $\$79^{95}$

The Super Archiver **"BIT-WRITER"!** is capable of duplicating even the "uncopyable" EA and SYN series which employ 34 FULL sectors/track. The **"BIT-WRITER"!** is capable of reproducing these and **FUTURE** protection schemes of non-physically damaged disks. Simple installation... **PLUG-IN** circuit board and 4 simple solder connections. The **"SUPER ARCHIVER"** with the **"BIT-WRITER"!** is the ultimate **PROGRAMMING/COPYING** device for Atari 1050's. **EXACT DUPLICATES** of originals are made! Copies run an **ANY** drive. Must be used with Super Archiver. Only $79.95 plus $5 S/H/I.

$\$39^{95}$ The "QUINTOPUS"!© $\$39^{95}$

The **"QUINTOPUS"!** is an inexpensive device that provides a tremendous amount of convenience while eliminating the problems associated with the endless "daisy-chaining" of peripherals (eg: drives, interfaces, printers, modems, cassettes, etc.). The **"QUINTOPUS"!** is an I/O port expander that converts a single I/O output/input into five additional outputs/inputs. Instead of daisy-chaining all your peripherals (which often times results in passing a signal through 30 feet or more of cable!), the **"QUINTOPUS"!** allows each device to be connected directly to the computers through only three or four feet of cable. This is particularly useful when attempting to use **ULTRASPEED** or **WARPSPEED** data transfer rates. The **"QUINTOPUS"!** also provides the "extra" I/O ports often needed to connect devices not having daisy-chaining capabilities. Cable resistance and compacitance are greatly reduced thereby significantly improving the opportunity of accurate data transfers! Only $39.95 plus $5 S/H/I. SIO cable is $5 extra if needed.

$\$59^{95}$ The "QUINTOPUS"!© $\$59^{95}$

(with SWITCHABLE PORTS!)

This Deluxe version of the **"QUINTOPUS!"** has all of the above features with the additional benefits of two **SWITCHABLE PORTS!** This means you can connect two computers to one printer or two printers to one computer; you can switch in a computer/printer combination and while you're printing out a long document, switch in a second computer to access a modem, disk drive, cassette deck, etc! Switch multiple combinations of peripherals or computers without the hassle or re-arranging I/O cables...simply flip a switch! Only $59.95 plus $5 S/H/I. SIO cable is $5 extra if needed.

LIMITED SPECIALS

These specials are available on a first come first served basis. Pre-owned items are in exceptionally clean condition and are in perfect operating order. All items are warrantied. Sorry ... no rainchecks. Order 5 or more items and we'll pay the freight. These SPECIALS are for C.S.S. customers only - NO DEALER DISCOUNTS! Add $5 to order for S/H/I.

	NORMALLY	LIMITED SPECIAL
1. SIO Cable (Standard)	$ 15	$ 5
2. Generic Power Supply for XL/XE computers (5 v.DC regulated - also ± 12 v available)	$ 35	$ 12
3. EXTRA HEAVY DUTY version of GENERIC POWER SUPPLY	$ 45	$ 19
4. 130XE with 320K POWER PLUS upgrade and Ultra Speed Plus installed (with power supply and cable)		$ 250
5. 1050 DISK DRIVES with SUPER ARCHIVER II and SILENCER installed (with power supply and cable)		$ 250
6. 20 MEG hard Drives complete! just plug in and turn on! No extras to purchase! Surplus industrial 8" originally sold for over $2000. Super dependable!	$ 2500	$ 595
7. SUPER PILL (without case)	$ 80	$ 22
8. XL FIX ROM	$ 70	$ 29
9. ULTRA MENU/DOS	$ 30	$ 19
10. DISKCRACKER (Newest version)	$ 50	$ 19
11. ELECTRONIC PHANTOM SECTOR MAKER DELUXE	$ 60	$ 35
12. MIRACLE (Disk only Version of Impossible)	$ 70	$ 19
13. IMPOSSIBLE for 800 or 800XL	$ 150	$ 69
14. XL MATE	$ 30	$ 15
15. COMPACTOR	$ 30	$ 15
16. KLONE II (Generic HAPPY Backup)	$ 100	$ 75
17. SILENCER	$ 30	$ 19
18. BLACK PATCH (MASTER)	$ 50	$ 25
19. BLACK PATCH DATA DISKS 1&2	$ 20	$ 10

REPAIRS

For 24-48 hour repair service on Atari computers or drives, call our repair department at (716) 586-5545 day or night. All work is guaranteed, NO minimum estimate fees: If you have two or more items for repair and don't want to spend any money .... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE ... we'll keep the other defective item for parts!

and MORE...

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

Digisound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs DIGISPEC!

Only $39.95

Polydisk Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

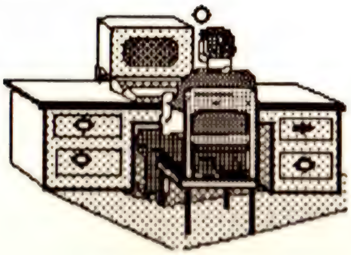
AIM is produced on a 2.5 Meg Atari ST, HP LaserJet II, Timeworks DTP and PageStream.

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS. A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable). Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of AIM or any participating club. Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp.



Editorial Ramblings

Welcome, CCCC, RACC, MAUG and LACE! Welcome to the AIM "Family" of Atari User Groups!

CCCC stands for the Central Connecticut Computer Club from Bristol, CT. They boast as one of their members the Atari GEnie SysOp Darlah Pine. Their club president is Rich Scheidel, otherwise known to CIS callers as Yankee Rich.

RACC is the Rockford Atari Computer Club from Rockford, Illinois. RACC members are receiving AIM as a supplement to their own newsletter. As you know, Rockford, IL is also the home of ICD, Inc., and this Atari Club has hosted meetings with ICD people like Craig Thom. We look forward to the report from the next meeting he has with RACC!

MAUG is the Mid-Ohio Atari User Group. Their club president is none other than Chuck Steinman, the creator of the Turbo-816. Readers of AIM have been enjoying his articles on the Turbo-816, the 16bit processor for the 8bit Atari line, for several months now. MAUG is based in Ontario, OH.

LACE is the Layton Atari Computer Enthusiasts. Their club is based in Roy, Utah. Irwin Brooks is the president of this small, but very devoted, Atari club. LACE is trying AIM out for this month to see how we fit their needs. We hope to have them along for as long as they find us useful!

On another note, the Genesse Atari Group (GAG) has changed status to an Affiliated club, and the Capitol Hill Atari Owners Society (CHAOS) has dropped relationship with AIM altogether.

We are happy to say we anticipate many more clubs joining the magazine as Participating Groups. We have four clubs now waiting to jump on with the November issue, and we may hear from others before the November deadline passes.

Bringing user groups more closely together to share ideas and experiences is what Atari Interface Magazine is all about. We would like to take this opportunity to give a special THANK YOU to all the clubs (and their contributing members!) that have participated in making AIM a first-class user group oriented publication.

Oops!

We made an error last month in saying John Scrutch was no longer employed at Atari Corp. We apologize to him and to his family for saying he was out of a job! In fact, John Scrutch is in charge of marketing for the 8bit systems at Atari.

Bill & Pattie Rayl

Atari Interface Magazine Offers User Groups a Low-Cost, Hassel-Free Newsletter Alternative

Press Release

ANN ARBOR, MI — Has your Atari user group found itself spending a large chunk of its funds to produce and mail a club newsletter? Do you have an overworked newsletter editor who scrambles to get each newsletter produced? Does your club find it increasingly harder to have a quality newsletter containing original articles? Has your club tried including Z*Net supplements only to find the increased production costs far outweigh the benefits?

Unicorn Publications, producer of Atari Interface Magazine (AIM), announces a plan to help Atari user groups overcome the hassles associated with producing a club newsletter. We invite your club to join groups from Michigan, Oklahoma, Texas, Illinois, Utah, Ohio and Connecticut in becoming a Participating Club in Atari Interface Magazine for the low price of only 50 cents per issue per member...for each member, that's only $6.00 per year!

For the price many clubs are currently paying for postage alone, your members can have a high quality, national newsletter delivered each month to their doors.

Here's how it works: Participating Clubs submit club news, minutes, reviews, editorials and other feature articles on or before the 17th of each month. Participating clubs also supply mailing labels for their members and a check or money order for 50 cents per supplied label.

Here at Unicorn Publications, we write monthly columns and features, and we do all the "dirty work" — editing, laying out and producing the magazine and mailing each issue to the club members.

For those of you unfamiliar with the history behind AIM, Unicorn Publications began producing the magazine in December, 1987, under the name Michigan Atari Magazine. With the addition of Participating Clubs outside Michigan, the publication evolved into Atari Interface Magazine.

The magazine supports both the Atari 8bit and ST computers. With over-the-counter sales in select Atari stores from Maine to California, chances are you can find AIM at your local dealer.

As well as submissions from participating clubs, the magazine currently includes these regular monthly columns:

- **Atari Bulletin Board, a look at what's new each month in the Atari world**
- **Turbo Info by DataQue's Chuck Steinman who discusses the Turbo-816 16bit processor upgrade for Atari 8bit owners**
- **Hard Drive Myths and Mysteries**
- **An in-depth tutorial to help people get the most from the AtariWriter+ wordprocessor**
- **The Right Brain, a look at Atari computing through the eyes of Paul Stampfli of the ST Club of El Paso**

If your editor is currently struggling to produce a monthly newsletter, or if your club has tried including Z*Net supplements only to find that local content has to be decreased or newsletter production costs soar out of reach, we urge you to consider participating in AIM.

Production and mailing of a monthly club newsletter is, quite often, the largest expense for a club. As a Participating Club paying only 50 cents per issue per member, your newsletter costs should decrease substantially. At the same time, your club joins with other Atari user groups to gain the benefits of participating in a national user group oriented publication.

For more information on becoming a Participating Club in Atari Interface Magazine and other benefits of participation, contact Pattie Snyder-Rayl at (313) 973-8825. Or, give our BBS a call at (313) 973-9137 (300/1200/2400 baud).

Unicorn Publications can be reached via electronic mail on CompuServe (ID 71361,411), GEnie (UNICORNPUB) and Delphi (UNICORNPUB). We hope to hear from your club soon!

Atari Bulletin Board

by Bill and Pattie Rayl

There is a bit of news this month from Atari headquarters. Atari President Sam Tramiel held an online conference on GEnie and lots of press releases appeared after The Dusseldorf Messe at the end of August.

In this issue, there is a report, complete with product pictures, on the Dusseldorf show from special correspondents Christian Strasheim and Michael Schutz of ST Vision.

Sam Tramiel Conference

In the online conference held on August 30, Sam Tramiel talked about the new STE and TT, both of which were officially announced to the public at the Dusseldorf show.

"The 1040 STE has a palette of 4096 colors, hardware fine screen scrolling and support for light guns, paddles and extra controllers. Also, Genlock is supported without the need for internal modification," Sam Tramiel stated. "The sound in the STE and TT are 8bit stereo PCM. The number of channels depends on the software.

"The TT has six built in graphics modes: the three ST modes, with 4096 colors, and three new modes: 640x480 16 colors, and 320x480 256 colors, both using the 4096 color palette, as well as a very high 1280x960 monochrome resolution. The TT has three chips for serial IO. Two 68901's, and an SCC, which can go much faster than the 68901. As well, in the VME slot, we will have future video boards which will knock your socks off.

"We plan to ship the TT in 4th quarter, 1989." Tramiel continued, "We will be shipping Stacy by October, in the US also, pending FCC bureaucracy.

"We will advertise in the appropriate magazines as we have all along. We are actively looking for a new US sales team and plan to launch the Portfolio with direct response big advertising in mid-September and to use this machine to attract dealers for the ST line as well."

Tramiel also indicated the STE would be available in the US by the end of October.

The Atari Marketplace

Sam went on to talk about the US and European markets. "There were 35,000 attendees at the three day Atari Fair. There were 145 third party software and hardware suppliers there as well. It was one hell of a show. The next challenge is to get the US market up to the same level of support.

"As most of you know, we had a tremendous DRAM shortage in the years of 1987 and 1988. We made a tactical decision to support Europe and keep our market there very strong. Very sorry to our loyal US supporters, but it was a necessity. Now the DRAM situation has reversed. Does anyone out there want DRAM?

"But seriously, it's now time to re-enter the US," Sam added. "At the Dusseldorf fair, we saw a lot of serious software, particularly graphics software. This runs on all ST products today. There is no question that in the personal computer market, games are very important. The better they are on your machine, the more you sell. But for reasons I mentioned before, we have not really launched in the US, but plan to starting in mid-September. As our distribution increases, so will our advertising.

ATW Afterthought

"Regarding the ATW, we have shipped the first 300 machines to Europe and plan to bring this machine into the US some time before the end of the year. I also think it is a great product, but we must focus on getting the ST going in the US, and if we do too many things at one time, we will not succeed," Sam concluded.

While he was in conference, he told conference attendees that he just heard news from overseas that Atari France burnt to the ground, with no one injured. The building next to Atari France's offices was reportedly to blame for the fire.

(Rainbow) TOS 1.4

Atari has released TOS 1.4 (also called Rainbow TOS), and you should be able to purchase the 6-chip ROM sets at your local Atari dealer.

Prices may vary, but Atari has set the retail price on the set at $99, not including installation. If you don't know who your nearest dealer with TOS 1.4 is, you can call Atari Customer Service at (408) 745-2367.

Atari Corp. recently modified their "trade-in" policy, increasing prices across the board. In the past, a standard 520ST CPU that had ceased to function could be traded in for only $95. With the new pricing, replacing that dead ST will now cost $300.

Atari Stock Watch

Atari Stock is on the rise! As we write this, Atari's stock was at 11-3/4. Atari's stock has been the most active stock on the American Stock Exchange for the month of September, and has risen in price by 40 percent.

In fact, on the 12th and 13th of September, more than *a million* shares of Atari stock changed hands. Most stock-watchers attribute this rise to the market's interest in the Atari Portfolio.

Portfolio at Local Dealers

On September 13, 1989, Atari officially announced that the Atari Portfolio was available worldwide. The IBM PC-compatible "palmtop" computer weighs one pound, is powered by three "AA" batteries and retails for $399.95. According to Atari President Sam Tramiel, "Atari Computer has been shipping the Portfolio to key European markets for a few months and we can't keep them on the shelves." The Portfolio was first introduced at the Spring COMDEX last April.

New Products

"Look Mom, No wires!" Practical Solutions has announced their Cordless Mouse for the ST. The mouse uses an infra-red signal, allowing you to use the device up to five feet away from the receiver. The Cordless Mouse comes with a full one year warranty, and though the mouse is due for release on October 20, Practical Solutions reports demand has been overwhelming. The Practical Solutions mouse retails for $129.95 and runs on two AAA batteries. For more information, contact Practical Solutions at (602) 322-6100.

The Cordless Mouse might be a good addition for the new "Hottest" game on the ST, Bloodwych from MirrorSoft. You'll find a review of this Dungeon Master-like game in this issue. Bloodwych's popularity is already assured, after the first shipments of the game into the US from England were sold out in a matter of days at most dealers!

Emulators Now Available

Another product who's popularity has been assured is Avant Garde's PC Ditto II, the hardware IBM/XT emulator for your ST. The coupons for half-off the retail price ($299) have been sent to registered owners of PC Ditto I, and most of the PC Ditto userbase should have received them. The Coupon is only redeemable until the 15th of October. According to Rick Flashman of Gribnif, the $150 coupon price for PC Ditto II is $50 below DEALER cost and a great bargain!

MichTron has recently announced they are marketing the German IBM emulator known as PC Speed. This upgrade board is similar to Avant Garde's design in that they both fit over the 68000 CPU chip. However, the PC Speed board requires soldering to the 68000, while PC Ditto II simply snaps in above the 68000 chip. PC Speed has a Norton SI Rating of 4, which is faster than PC Ditto II's advertised SI Rating of 3. PC Speed retails for $399.95. For more information, call MichTron at (313) 334-5700.

New Version of WordPerfect

WordPerfect Corp. has just started shipping their latest version of the word processor extraordinare. If you have an earlier version of WordPerfect other than 4.1, you can upgrade for only $17.50 — including shipping and handling. To send for the upgrade, write WordPerfect Atari Update, 1555 N. Technology Way, Orem, UT 84057 or call (801) 225-5000.

New Utility Package

Double Click Software has announced the availablity of DC Utilites, a collection of some very useful and innovative utility programs for the ST. Included on the disk is a fast ARC extraction Desk Accessory, a self-extracing ARC program, a program to turn Desktop.Inf files into executable files, "the fastest RAM-disk available," and more. DC Utilities retails for $30. For more information, call Double Click's support BBS at (713) 944-0108.

The long-awaited MasterLink terminal program for the ST from Intersect Software is now available. Featuring "total background operation," loadable file transfer protocols, a built-in script language and much more, MasterLink (version 1.2) brings new power to ST telecommunications. MasterLink retails for $59, and owners of InterLink can upgrade for only $23. Contact Intersect Software, 3949 Sawyer Rd, Sarasota, FL 34233.

Commercial to Shareware Packages

Draper Pascal 2.1 for the Atari 8bit is now Shareware and is available on the online services (and probably your local User Group!). A 39-page manual with tutorial is included in this Shareware release.

On the ST side, Aegis Animator has been released into the Shareware market! If you're looking for a graphic animation package, take a look at Aegis Animator.

Remember to support the Shareware concept; if you continue to use these program, send in your contribution!

ST Vision Magazine

ST Vision is a German User Group located in Langen, West Germany. Their newsletter goes to over 5,000 readers and is as professonally done as some US ST magazines — possibly more so! You can get the latest European Atari news delivered monthly, but you need to read German! Their address is Postfach 1651, D-6070 Langen, West Germany.

Atari Messe Dusseldorf (August 25 - 27, 1989)

by Christian Strasheim and Michael Schutz

This show report appears courtesy of the ST VISION User Group of West Germany.

During the last weekend in August, Atari again held its annual "Atari Messe" in Dusseldorf, West Germany. Over 150 exhibitors from all over Europe — and even some from overseas — showed their Atari related products in Halls 1 and 2 of the fairground in Dusseldorf. The fair lasted the usual three days, and during that time more than 35,000 visitors strolled through the halls.

As announced by Atari before the fair, Dusseldorf saw the world premiere of two new Atari computer models — the TT and the 1040 STE. Over the last one-and-a-half years the TT had already been shown secretly in backrooms at other fairs, but here in Dusseldorf, the new flagship of the Atari ST line was presented publicly for the first time.

The TT uses the Motorola 68030 processor and runs under the new TOS030. Most of the currently available ST software will run on the TT without major changes — with a speed improvement ranging from three to ten times faster than on an 8MHz 68000 ST.

At the end of this year, UNIX System V (Version 5.31), XWINDOWS and the newly developed operating system for the TT will be available. The TT itself will be available sometime in November '89 for a price of approximately DM 6,500. This includes the TT with TOS030, 2 MB RAM, a 30 MB harddisk and a monochrome monitor.

The Enhanced ST (1040 STE) is a 1040 ST with a new TOS and much better sound and graphic abilities. It can display 512 colors at once out of 4,096 different colors/shades. [Ed. Note: According to Atari U.S. the STE will only be able to display 16 colors in low resolution and four colors in medium — the same as the current ST computers. Access to, and displaying of, more than 16 colors at once must be handled by software.]

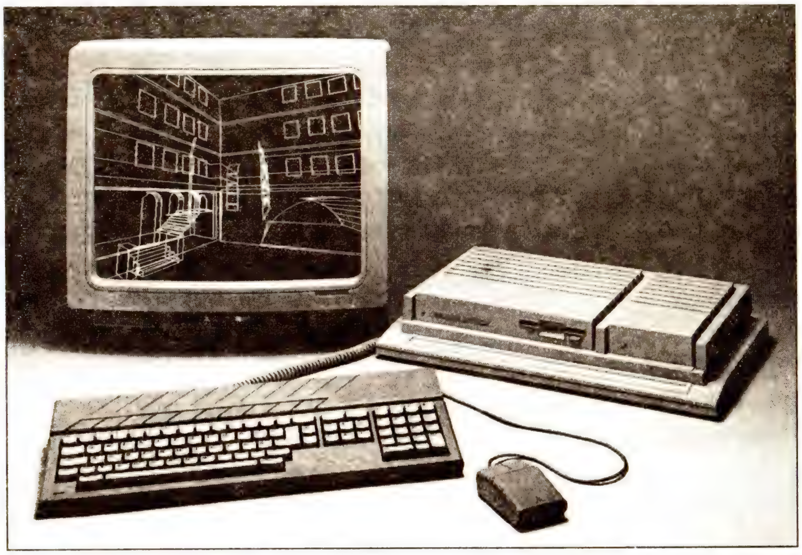
Besides the standard connections, the STE allows the user to plug in up to six joysticks, a lightgun or a light rifle. A stereo-sound-output makes the playing of PCM sound directly through a stereo system possible. [Ed. Note: According to Sam Tramiel, the STE also supports GENLOCK with no internal modifications.] The 1040 STE with these features is aimed at the young computer gamers and graphics applications. Its similarities to the Amiga 500 are obvious.

The price of the 1040 STE lies around DM 1,500 — slightly above the price for a standard 1040 ST. This raises the question of whether Atari will discontinue production of the older 1040 model soon, because who in the future will buy an inferior machine if he/she can get a much better one for a little bit more money?

Other products shown by Atari were the PC Portfolio, the ATW transputer and the small transportable game system LYNX (better known as Portable Color Entertainment System) and, naturally, the PC line up to the 80386-based PC5. As already seen at other fairs, both PC Portfolio and LYNX got a lot of attention during their presentations.

Many ST users waited for it a long time, but since a couple of weeks ago the wait here in Germany is over. At last the ST can run MS-DOS software through the help of hardware MS-DOS emulators.

In Dusseldorf, the two German hardware emulators, PC Speed and SuperCharger, were



The Newly Announced Atari TT

demoed. While the SuperCharger starts selling soon after the fair, PC Speed has been on the market for a couple of weeks before the show. Both products are not vaporware; they are running and are looking good. [Ed. Note: Michtron has just announced they will be selling PC Speed here in the U.S. For more info, see "Atari Bulletin Board" elsewhere in this issue.]

Another topic of the fair was networking with the ST. In Dusseldorf, a couple of companies were showing their ST network solutions. The Munich-based company Bavaria Soft presented a complete networking solution for LAN's (Local Area Networks) based on ST computers in combination with BioNet or eLAN. The system includes up to 20 terminals and features address-, customer- and department-management, order handling, writing of invoices, product calculation and accounting.

Many other new products were demoed, plus new versions of established programs were announced. But, the most interesting fact that distinguishes this fair from a lot of other fairs is that in Dusseldorf — other than a very small percentage — most of the exhibitors presented only application software and hardware and no games. This show once again proved that the ST here in Europe, especially in Germany, is playing a major role in the computer market.

The ToadFile 44

The first LOW PRICED Removable Cartridge Hard Disk Drive!

We at Toad Computers wonder why good technology always has to mean high prices and long waits. We have the Toadfile 44 **now**, available in varying configurations with fixed drives up to 129 megabytes, while other companies are still telling you to wait. We also have **the lowest price** available. We use the same drive Atari™ will be using in their drive, and compatible cartridges will be available at your Atari™ dealer, or through us. Finally, the capacity of a hard disk with the convenience of a floppy. Only from the leaders! Toad Computers.

ToadFile 44 - ONLY $899!

Basic unit includes drive, one 44 megabyte cartridge, case, power supply, fan, ICD™ host adapter, clock, formatting and partitioning software, and a 3' DMA cable. Please specify an under-the-monitor case or a shoebox style case. Both may hold two 5.25" or 3.5" drives. Extra 44 MB cartridges are $99 when purchased with drive, or $109 later.

ToadFile 44 *Variations*
ToadFile 94 *(44 MB Cartridge + 50 MB Drive 40ms time)*............$1279
ToadFile 109 *(44 MB Cartridge + 65 MB Drive 40ms time)*...........$1309
ToadFile 129X *(44 MB Cartridge + 85 MB Drive 28 ms time)*.......$1399
ToadFile 88X *(2 44 MB Cartridge Drives & Carts, 25 ms time)*.....$1549
ToadFile 44S *(44 MB Cartridge Drive, Case, Power & SCSI In)*.....$799
ToadFile 44D *(44 MB Cartridge Drive Only, No Power or Case)*....$699

Toad *Hard Disk Drives*
Toad 30 *Drive 40 ms Access Time 3.5" Mechanism*........................$539
Toad 50 *Drive 40 ms Access Time 3.5" Mechanism*........................$599
Toad 85 *Drive 28 ms Access Time 5.25" Mechanism*......................$709
Toad 100 *Drive 40 ms Access Time 2 3.5" Mechanisms*............$899
Toad 170 *Drive 28 ms Access Time 2 5.25" Mechanisms*............$1399

Dallas WOA

by Tim Holt (ST of El Paso)

I convinced fellow member Richard Hayden that driving to Dallas from El Paso would be a neat way to end the summer. I guess that I forgot Dallas is 600 miles from El Paso. I guess that I forgot that the first 300 miles are all scrub brush and tumbleweeds. Oh well, when we finally got to Dallas, I forgot that the Dallas World of Atari Show wasn't in Dallas, it was in Irving, the same city the Dallas Cowboys are from. What a strange state Texas is.

We arrived at the Dallas WOA show before it actually opened. It was being held in a meeting room at a Holiday Inn. I would guess three hundred folks were in the small lobby, all talking computer-ese.

"Say Leroy, your Z-28.9 D upgrade is unusable. It needs a B45 chip in the doo-hickey slot."

"Ok, Billy, I will send it to you with a B-17 hard drive processor file with the FBI index monitor thing-a-ma-bob."

I looked around. I looked at Richard. We both had the same thought at the same time: we had stepped into the Twilight Zone and were part of the episode "Invasion of the Nerd People." It was scary.

When the doors finally opened (15 minutes late), it was like stepping into an Atari orgasm. There were things on display that I had only heard of, things that I knew I could never afford. I headed straight for the Atari booth. STacy had to be there. Portfolio had to be there. Lynx had to be there. TT maybe? ST-E maybe?

THE
WORLD
OF
ATARI

Well, it was a bit of a disappointment. No STacy. A Mr. Crosby from Atari said it was going to a more important show in Canada. I felt a bit slighted.

Then Mr. Crosby said that the LYNX game system was not going to be shown either. I felt more slighted. The Portfolio was there and I played with it for a while. It was guarded by about 6 Atari business suit types, like the crown jewels.

Sig Hartmann was there, and some Texas good old boy was trying to pick a fight with him. "Atari said that there would be this, and that, and this.." Sig looked at the gent, "You have a poor memory..." and that set them off for about 10 more minutes. Welcome to Texas.

Ok, the Atari booth was a waste, but the dealers' booths were great! Things from Europe that I never heard of. Ever heard of a game called KULT? We got it for $17. Great deals on other stuff too. WordWriter for $30. Hotwire for $30. Codehead was there, showing off all the goodies; Migraph had a lovely lady showing off the Hand Scanner. I only mention that she was lovely because there was a nice-looking guy there doing the same thing, and no one was paying attention to him.

I met Dave and Sandy Small, who were showing off the new Spectre GCR. Looked really nice. I even got a pin that says: I've seen the Spectre GCR.

There were literally hundreds of copies of the Falcon Mission disk being sold for $15. If they say that they haven't sold any of those babies, I will know the truth!

I went to a conference where Sig Hartmann continued the song and dance about this being the year of Atari in the US. I would have believed it in February. It was August. I didn't believe it.

I was glad I went. There were incredible deals. From an economic point of view, these shows are great. Unfortunately, every person that was there was an Atari user. Every person at the Holiday Inn knew about the value of Atari. The show was preaching to the choir. And that is not the folks that Atari, or the folks that organize these shows, need to preach to. It is the Mac users, the IBM-ers and all the undecided users who need to know about Atari.

Reports I have read said that anywhere from 1200-1700 people saw the WOA show. I believe that latter number. The place was packed on Saturday. Not bad considering...there was NO ADVERTIZING at all in any Dallas paper. NO radio advertizing. NO TV coverage or advertizing. I really wonder how anyone can expect to spread the word, when there is no word going out. Oh well, we know about it. I am glad I went. Too bad the "real world" didn't know about the show.

Expectations

by Jim Jenkins (El Paso)

Every one of us has expectations of the firms we do business with. Since each of us is different, it is only natural to assume there are as many different expectations as there are customers. Consumer oriented firms must respond to *rational* expectations in a reasonable manner, otherwise, we will take our business elsewhere.

Recently, while discussing expectations about a certain firm, I found myself on the defensive. I accused my friend of irrational expectations, demands and attitudes about the company. And then I began to think about it...

What should you expect from "the company?"

Expect self-preservation. Policy and procedures must be made to preserve the corporate body. Failure to do so means they will not exist when you need them. If you want them to be there for you, then expect them to make policies and procedures which will insure they will. And, you must "be there for them."

Expect the company to make a "normal" profit. Failure to make a normal profit contradicts the first expectation. A company does not attract or retain shareholders unless it makes a reasonable profit. Every organization has profit centers and cost centers.

The myopic view eliminates "cost centers" and creates "profit centers" which maximize profits by charging "what the traffic will bear." Losses occur, especially in service centers, but these losses are normally balanced by an allowance in the normal mark-up. The necessary mark-up on products must include other costs such as marketing, warranty service, and research and development. So, if you want the company to make a normal profit, you must be willing to pay for my expectations.

Expect a professional attitude from the board of directors and that the same attitude will permeate the entire organization. Professional attitude is a combination of understanding the products and the goals of the company, and consistent attempts to satisfy the needs of the customer.

If you expect the "company" to display a professional attitude, you must be willing to act professionally. Part of this professional attitude is mutual respect. Any firm must respect its customer base. (And its dealer base.) Respect does not mean unwise policies biased toward the customer. Respect does mean a responsible attempt by the company to meet the needs of the customers (and dealers) in light of self-preservation and normal profits. It is not callous attitudes toward these persons. Respect is based on trust and information.

Expect credibility in a company. The company must release reliable information to meet the needs of the consumer, and the consumer must not encourage rumor by stating opinion and half-truth as if it is fact. Press releases and news conferences must not be a source of disinformation. Constant delays and announcements for products which never reach the market destroy confidence.

Expect research and product development. Technology which stands still is destined for obscurity. Product revisions must be made available to the installed customer base, but only within the limits established by these other expectations.

New products and innovations which cannot be classed as revisions must also be developed. Upward compatibility is desirable in new products, but if you must change, don't abandon your older products. Since you want both revisions and innovations, you must be prepared to buy both.

These expectations are reasonable. Any firm which ignores these points is destined to fail. Often it is difficult to make observations which are neither biased nor emotional. Perhaps by applying these expectations to our observations, we can better understand what is taking place.

Why don't you advertise more?

The most powerful form of advertising today is the television. The media executives realize this and charge accordingly. An advertising campaign must either be massive or consistent. National rates for "prime" advertising spots are so high that millions of dollars must be spent to achieve recognition.

If a two million dollar advertising campaign is implemented, then two million dollars must be added to the cost of the products. Raising prices is a difficult task, especially if you are trying to be a price leader. And advertising more will mean raising prices.

Since an efficient company will operate at lowest possible production cost, selling more does not increase profit margin, just total revenues. When we ask for more advertising, aren't we asking for higher prices?

Why do you constantly announce products that you don't deliver?

Research and development can carry technology beyond the capability to deliver at a reasonable cost. Proto-typing is expensive, but manufacturing something that will not sell is even more expensive. Because a production line requires a minimum quantity be manufactured, a market must exist before a product is made. Product announcements, industry wide, are made to help establish initial production requirements. If the survey indicates the product will not be successful, then the product is shelved, and only the R&D cost for proto-typing is lost.

Why can't you offer trade-in upgrades to newer products?

Anybody can offer a trade, but if we accept these expectations, the company must break even (make a normal profit) on the trade. Depreciation and obsolescence must be accounted for, as should be the value derived from your use of the product. Subtract about 30% from a realistic purchase price for used equipment, and you have the approximate trade value against suggested RETAIL price.

Dealers may offer trades, but VERY FEW manufacturers do. Trade value varies according to what you buy and "what you pay" for the new merchandise. If we ask manufactures to offer us direct trade-ins, are we going to be happy with their offer? I doubt it. And, will we be satisfied when you local dealer invites you to get your service directly from the manufacturer?

And now I leave you to evaluate "the company."

Virus Write Detector for the ST

by Don Neff (MACE)

I usually buy PD disks from the many Atari user groups that attend the computer shows around our area. Recently the disk librarian of one of these groups alerted MACE that most of his PD disks were carrying a virus.

When I checked my disk collection I found the virus on every disk I bought at the Detroit WOA show. Luckily this particular virus affects only floppy disks and, since I boot from a hard drive, my system had not been harmed by it. I was lucky this time, but what if the next virus affects hard drives too?

We obviously need something to alert us when a virus is copying itself to our floppy disks and it has to be something a virus cannot turn off or "trap" its way around. I developed the simple circuit in Figure 1 to monitor ST floppy drives and give us a fighting chance to prevent a virus from spreading through all our disks.

Virus Reproduction

A virus can't begin causing problems right away because that would be announcing itself and we'd get rid of it, ending the problem immediately.

Instead, a virus reproduces itself quietly on your other floppy disks first before doing its damage or getting detected. Some viruses have counters that set them off only after they've reproduced on a certain number of disks first. Other viruses are triggered by dates captured from your system clock.

The one I encountered is waiting for a "Key" disk that contains the rest of the code needed to do its nasty deed. This same virus is probably in all the Atari user group libraries across the U.S. and Canada already since it has remained dormant, and therefore undetected until recently.

Users of other brands of computers have been unfortunate enough to receive viruses in sealed, commercial software packages from trusted software houses. One such virus came directly from inside Apple Corp itself in their own official software. Do not assume you are safe from viruses just because you've been avoiding PD software.

Viruses share one weakness in common; they all must write to your disks to reproduce themselves. Every time you boot from a virus-contaminated floppy disk the virus gets installed in your ST where it runs continuously in the background, checking all subsequent disks.

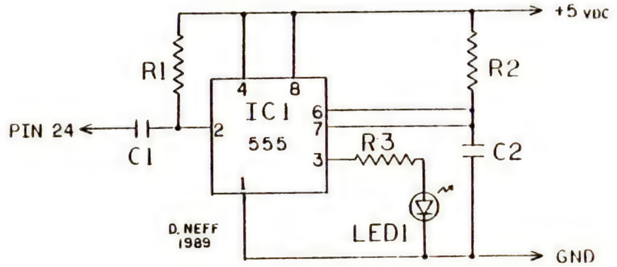

FIGURE 1

The virus won't read a disk itself because the drive access light would come on at inappropriate times and that would be a giveaway that a virus exists. Instead, it waits until you do a disk operation and then does its work while the drive is still running.

Since we are accustommed to the drive light staying on longer than needed anyway, we don't notice the extra second or two the virus adds to the operation. Whenever you read or write to a floppy disk, the virus program takes the opportunity to check that disk to see if a copy of the virus already exists on the disk. If it doesn't find a copy of itself, and the disk is not write protected, it writes itself to the boot sector of the disk.

The virus program either monitors or traps the "Write Protect" signal from the disk drive so it doesn't reveal itself by triggering the "Disk is Write Protected" dialog box by trying to copy itself to a write protected disk during a read operation. Fortunately, there is another signal the virus cannot control without neutering itself in the process; a "catch 22" for virus authors that we will use to our benefit.

Write Gates

Every disk drive defaults to "Read Only" status until it is temporarily forced into "Write" mode by an extra signal. The data to be written is blocked from the floppy disk in the drive by a protective system referred to as a "Write Gate."

In order to write anything to a floppy disk, the computer must open this gate first with the "Write Gate Signal" on pin 24 of the 34-pin floppy drive ribbon cable. Every virus has to use this same signal to reproduce itself on your floppy disks.

The circuit in Figure 1 monitors this signal line and lights an LED to tell you every time the write gate is being opened. The LED will light up whenever you write to a disk, erase a file or format a disk whether a virus is active or not. But, if this LED ever lights up when you are not intentionally writing to a disk, (i.e. copying files from a disk or just reading a directory) you can be certain that a virus is in your ST and is writing itself to your disk.

The Circuit

IC1, a 555 timer, sits idle until line 24 of the 34-pin drive connector cable opens a write gate by dropping to a low voltage level. The low voltage turns on the 555 timer which lights the LED for about 3 seconds. Most virus writing operations will take place quickly and the resulting quick blink of the LED would be overlooked without the 3 second time delay.

Since this write gate signal is common to both of your floppy drives, this one LED will monitor both drives at the same time regardless of which one it is connected to. The LED will tell you a drive is being written to, and the access light of that drive will tell you which drive is being affected.

The circuit board is small enough to fit comfortably inside an ST case or a GTS-100 drive but may be a bit tight in a standard Atari external floppy drive case. The 5 volt and the ground connections are made at the power plug of one of the drives. The LED must be mounted so it is always visible from your normal position at the computer keyboard or its usefulness will be lost.

Shareware Journalism

User groups may reproduce my ST articles in their club newsletters. All I ask for in return is a copy of your newsletter containing my article (send it to 9211 Pierson, Detroit, Michigan, 48228). I enjoy reading about other Atari users, and this also tells me if you are interested in these projects (which take a lot of my time to develop and write).

I made the same request when I wrote about Atari 8bit projects, but have never received a single issue of any club newsletters. I interpreted that as a sign of total lack of interest in my Atari 8bit projects and stopped writing about 8bits. Several 8bit projects I had completed, but not published, are being converted to the ST and will be printed here in AIM.

Parts List

All the parts for this project are available from Radio Shack. The value and stock number for each part are listed here for your convenience.

C1	.01 uf	272-131	C2	100 uf	272-1016
IC1	555 IC	276-1723	LED1	Red	276-041
R1	47K	271-042	R2	33K	271-040
R3	330	271-017	PC Board		276-159

Go ahead. Punch it.

For the ATARI 520ST, 1040ST, MEGA and STACY.
Step a generation ahead with **TURBO16** by Fast Technology. The **TURBO16** accelerator can move your ST into high gear. Upgrade your ST and achieve *up to double the speed* in some applications.
Take Your ST Past Its Limits.
TURBO16 will *dramatically* increase your desktop performance. Complex illustrating and page layout is no longer a *drag, click and wait*. **TURBO16** will increase your ST's speed from 8MHz to a *blazing* 16MHz. A state-of-the-art 16MHz processor and 32k high-speed cache memory add the power that lets you *soar*. **TURBO16** is fully compatible with standard ST software, including *Spectre 128* and *pc-ditto*, and **TURBO16** makes games *fly*. **TURBO16** has a far greater effect on productivity than a hard disk, and at **$299 suggested list**, a far lesser effect on your wallet.

SPEED LIMIT 8MHz

Easy To Install, Easy To Use.
TURBO16's installation requires only the removal and replacement of your ST's 8MHz 68000 chip, and connection to the ST's MMU chip 16MHz clock. That's it! The low profile package will not interfere with other upgrades, and **TURBO16**'s special features optimize your ST's operations. **TURBO16**'s speed can be controlled by way of an optional, dealer-supplied hardware switch, auto folder program or desk accessory. Take full advantage of your ST's power with **TURBO16**. See your Atari dealer today, or contact Fast Technology.

TURBO16 is a trademark of Fast Technology. **Atari** is a registered trademark and **ST**, **520ST**, **1040ST**, **MEGA** and **STACY** are trademarks of Atari Corp. **Spectre 128** is a trademark of Gadgets by Small, Inc. **pc-ditto** is a trademark of Avant-Garde Systems.

We won't tell.

The Black Box Now Available from Computer Software Services

Courtesy CSS

There has been a great deal of interest since the announcement this spring concerning the Black Box, so hopefully this article will answer the majority of questions.

The Black Box is an add-on board for the Atari 600XL (upgraded), 800XL and 130XE 8-bit computers. It is a T-shaped board that plugs into the PBI port of the XL computer or the ECI and cartridge ports of the 130XE. Connectors for both types of computers are built-in to the Black Box, so no adaptor boards are necessary.

A cartridge port is available on the board itself for 130XE users, since the board plugs in where cartridges are normally added. The board is 12 inches wide and 3 inches deep, sitting back 3 inches from your computer. It has two switches, two push-buttons and a set of dip switches on the top.

What the Black Box does

The Black Box provides many unique and useful functions. The three primary functions are: RS-232 serial modem port, Parallel printer port and a SASI/SCSI hard disk port. A fourth floppy disk port for connecting 3.5" or 5.25" floppy drives will be available at a later date.

The RS-232 port provides the full RS232 specification signal levels for a modem or other serial device. It emulates the Atari 850 interface very closely, but goes beyond by providing 19,200 baud capability.

The R: driver is built-in to the Black Box, so it does not use ANY user memory!

The Parallel Printer port interfaces to most Centronics-type printers. You may assign the printer number and linefeed options from within the Black Box's configuration menu. The Black Box also provides you with a printer buffer, if the board or your computer has extra memory.

A printer buffer allows you to quickly dump your file to be printed into the buffer memory, then go about your business as the Black Box sends the data to your printer; a real time saver! The Black Box will use either its own RAM (if you order the 64K version) or the 130XE extended memory banks; it's all controlled by the configuration menu.

8Bit Hard Drive Interface

The Hard Disk port is the real reason for the design of the Black Box. You may connect most any hard disk controller that is SASI or SCSI compatible or drives with embedded SCSI controllers. It is totally compatible with the current versions of MYDOS and SpartaDOS (which both have a limit of 16 megabytes per logical drive), but a newer version of MYDOS is provided that is capable of 48 megs per drive. Combine that with nine drives and that's over 400 megs available at one time!

The Black Box also provides a conversion toggle for drives capable of 512 byte sectors only. Many of the embedded drives have this limitation and previously were unusable. The Black Box splits each 512 byte sector into two 256 byte sectors, so your DOS will still only see what it requires.

Another advantage is storage space. Many drives/controllers will give you more storage when using 512 byte sectors, some as much as 15% more!

Currently, format software for the Black Box supports the following drives/controllers: Adaptec 4000A and 4070, Xebec S1410, Western Digital 1002S HD, OMTI 352x controllers and all Maxtor and Seagate embedded SCSI drives.

Hard Drive Features

A partition is defined as a part of the hard disk that is seen by the computer as a separate disk drive. Since many hard disks are very large, it is useful to create several partitions of the drive, instead of one single drive, as your DOS sees it.

The Black Box goes one step further in not only letting you define the partition for each of your nine available drives, but allows you to have a list of up to 96 partitions, with names! Since a partition can be very small, you can make several small partitions of 720 sectors (the same length as a standard floppy disk) and sector-copy any of your non-protected programs to these partitions. Now you can swap that partition in as Drive 1 and boot your program at hard disk speed!

Configuring the Black Box

The configuration menu is the 'heart' of the Black Box. You can enter the menu from anywhere you are by simply pressing one of the buttons on the board. You may now edit the hard disk configuration, exchange drive numbers, enable/disable the modem and printer ports or go into the 6502 monitor.

After you are finished, pressing ESCAPE will put you right back into the

Hard Disk Systems to Fit Every Budget

- All systems are complete and ready to use, included at *no extra cost* are clock/calendar and cooling blower(s).
- All ABCO Hard Disk Systems Are Fully Expandable (you are *not* limited to two drives only!) All cables and connectors installed.
- Seagate Hard Disk Mechanisms Only!
- ICD Host Adapters Used Exclusively
- OMTI High Speed Controllers

Listed above are a sampling of the systems available. Prices also reflect various cabinet/power supply configurations (over 60 configurations are available) All Units: Average Access Time: 24ms to 34m. Larger units are available (special order only).

- All Units Compatible with Magic Sac, PC-Ditto/II and the Spectre/GCR
- Removable Media Devices Available (44mb) Syquest 555
- Available for ST -- Amiga -- IBM
- Lowboy - Standard - Dual Blower Cabinets
- Custom Walnut WOODEN Cabinets
- Tower - AT - XT Cabinets
- All Power Supplies UL Approved
- 12 month FULL Guarantee
- Quantity & User Group Discounts Available!
- Dealer inquiries welcome!
- Personal Checks are accepted.

ABCO Computer Electronics Inc.
P.O. Box 6672
Jacksonville, Florida 32236-6672
Est. 1985

Ph: 904-783-3319 10 AM - 4 PM EDT
BBS: 904-786-4176 1200-9600 Baud
FAX: 904-783-3319 12 PM - 6 AM EDT

program you were using! No memory or screen display is destroyed by using the menu!

The 6502 monitor is very handy for machine language programmers. How often have you wondered where your program was or what caused an apparent 'lock-up'? Entering the monitor will show you all the processor registers and display the disassembly of the instruction it was about to execute when you entered the monitor. Users of MAC/65's DDT will feel right at home with the monitor's use.

Other Features

The Black Box has other 'goodies' in it. Any communication with your floppy drive will be in high speed if you are using an XF-551, a modified 1050 or a Happy 810. This will work with just about ANY DOS or utility!

A text or graphics printer dump of your current screen may be done at any time by pressing one of the buttons on the Black Box. (The graphics dump is only available for dot-matrix printers capable of graphics.)

You may write-protect ALL of your hard disks by flipping another switch on the board. This can be a real life-saver when running a new piece of software. The Black Box provides disk I/O tones with separate pitches for disk reads and writes to your hard disk, so you can hear what's going on! This option may be disabled within the configuration menu.

The Black Box also provides support for users who have used an MIO previously to store data on a hard disk. The MIO actually stores data invertedly; this is fine as long as the MIO reads it, but when another host adapter reads the same data, it will be meaningless. By setting a dip switch, a previous MIO user will now be able to access all the data on his drive with the Black Box, with a small sacrifice in speed.

If you have any more questions, please feel free to call. User group and dealer discounts are available.

The retail price of the Black Box with no buffer ram is $199.95, and with 64K RAM buffer is $249.95.

AtariWriter+ for Those Who Don't Want to Read the Book -- Part III

by Jimmy Boyce (CACE)

Well as I promised last month we are done with editing — HOORAY!!!

Now, let's check the spelling before we print it. That way we won't waste printer paper doing it over again because we misspelled a word.

The creators of AtariWriter+ call their spellchecker "ATARI Proofreader" <pg 49>. A rose by any other color still checks spelling. The dictionary disk is very small (only 36,000 words), but you can improve on that by creating your own dictionary disk. We will go over all of that in due time. Believe me, if you don't have your own dictionary disk and you use a lot of technical terms like I do, then I suggest setting one up. It will save you a wealth of time and trouble.

Proofreader is a menu-driven program just like AW+ and just as easy to use. So, let's get started! You have just finished your document and it is edited and saved. Go to the menu and gently stroke the letter [V].

Ah, the purr and whirr of the disk drive...and then, what to your wondering eyes should appear? No, not Santa Claus, but a little message that says, "INSERT PROGRAM DISK THEN PRESS RETURN." Hmmm. OK, stick in the dictionary disk and press RETURN.

Purr and whirr..."INSERT PROGRAM DISK THEN PRESS RETURN." Wait a minute, I did that! "Stupid program doesn't work." That was my first encounter with Proofreader, so I put the program disk back in, did the whole bit again and up at the top of the screen it said in bold and brazen letters "LOADING PROOFREADER" <pg 49>. And, what to my wondering eyes should appear but a whole new menu <pg 50>.

First off, let me say that nice key in the upper left corner of the keyboard ([ESC] <pg 51>) will get you out of most any jam and get you back to the menu that you are presently staring at (assuming you are following along in AtariWriter+ while reading this. You are doing that, aren't you?).

This menu works just like the Main Menu. When you poke the key that matches the inverse letter on the screen, little messages are given at the bottom of the screen and you do what the messages tell you to do. Pretty simple actually, unless you are like me and can't or won't read the book until you get into trouble.

A couple things to remember, first this is a spell checker and that is it. Second, if the word is spelled correctly but is in the wrong context, Proofreader will say it is a valid spelling (i.e., their and there). Proofreader does not capitalize either, nor does it check punctuation.

This is the nifty one — if you spell a word correctly and that word is not in the Proofreader's dictionary, your word will be considered spelled wrong (another case for a personal dictionary). So, lets get on with it.

The first item on the menu is CORRECT ERRORS <pg 53>. Lay a finger tip on the letter [C] and you are told where to put your dictionary disk. If you have a one drive system, then it is logical that you must place the dictionary disk in drive one. If you have a two drive system, you will be prompted to place the dictionary disk in drive two (if you have it turned on).

Now the fun begins — notice that your document is on the screen and a little menu is at the bottom of the screen. The little menu reads:

C RETURN CORRECT WORD

D RETURN SEARCH DICTIONARY

RETURN KEEP THIS SPELLING

and over on the extreme right hand side it says "CHOICE:"

As your masterpiece blips past your eyes, the words are in their regular appearance on your screen. Oops, what is this? All has stopped and there sits the word TAHT highlighted. Now you have a choice to make.

First choice: pounce on the letter [C] and change the spelling to THAT, and answer the prompts.

Second choice: let's say it is one of those days that you cannot remember how to tie your shoelaces and you cannot remember how to spell the highlighted word.

Bang on the [D] key and do as directed — type in at least two letters of the word, hit [RETURN] and a list of words with those beginning two letters will appear at the top of the screen (if there are any). Once you find your correct spelling, follow the directions at the bottom of the screen and type in the correct spelling.

Your third option is that TAHT is a name or something of that nature and you strike [RETURN] to keep the spelling of that particular word. Proofreader keeps in memory the word TAHT and will accept it for the rest of your document.

Well, folks. That is it for now. Bye until next time.

Bloodwych

by Bob Retelle (MACE,WAUG)

Stop the presses! Dungeon Master II is here! Only it's not called "Chaos Strikes Back" or "The Revenge of Chaos." It's called "Bloodwych," and it's from Image Works in England, not FTL.

Almost immediately after the release of Dungeon Master, the phenomenally successful graphic role-playing game from FTL Games, there was a tremendous demand for more of the same. For whatever reason, that demand has gone unfulfilled, until now.

In a review in a British magazine, it was mentioned that the author of Bloodwych didn't model the game after Dungeon Master, but the similarities are immediately obvious as soon as you boot up the game. Whether it's true or not that Bloodwych was developed independently, it will always be part of the "Dungeon Master" genre.

Bloodwych Basics

Essentially, Bloodwych is a "2-player" Dungeon Master. When you load the game, you can choose either a one-player or two-player game. A one-player game is played with the mouse, almost exactly like Dungeon Master, while a 2-player game forces both players to use joysticks. In both cases the keyboard can be used to move your party, again just like in Dungeon Master.

The 2-player game divides the screen in half horizontally, and everything is duplicated for both players. Each player sees the view that his party sees, independently of the other player's party. Thus you can actually find the other player's party and see them, while you see your own party in the other player's view.

The instruction manual that comes with the import version of the game appears quite extensive at first, until you realize it's written in four different languages. The 20 or so pages in English do a good job of explaining how to operate the game, which is very complex.

Anyone who hasn't played Dungeon Master before (IS there anyone who hasn't played Dungeon Master?) will have to do a lot of experimenting with the controls and screens to master them. Even experienced Dungeon Master players will have to become accustomed to the differences in the ways the displays and spells work, although it soon becomes second nature to flash around the screen clicking on status charts and spell books.

Storybook Time

As is customary in these kinds of games, there is a three page introductory story to set the scene. This time, the brotherhood of Psychic Mages, which was called the Bloodwych, let themselves fall victim to one of their own, an ambitious Wizard named Zendick. He destroyed the leader of the Bloodwych and banished the other members to the astral plane. Then began the mandatory reign of terror on the countryside.

You (of course) are the one hero in the Bloodwych who can save the world from chaos. By choosing among the last sixteen mortal Champions in the realm, and guiding them through Zendick's castle, you can restore order and balance to the universe (stop me if any of this sounds too familiar).

The overall goal of Bloodwych is to explore the four towers of the castle in search of four crystals that will help you destroy Zendick, then to confront and defeat the evil Wizard himself.

Getting Started

At the start of the game, you can choose between a one or two player game and whether you want to choose your own Champions or have a random party preselected for you. There are 16 Champions, four each of four different "Psyche Types," with each type represented by a different card suit (Spades, Clubs, Hearts, Diamonds). They are Fighters, Mages, Adventurers and Archer/Assasins.

There is also four specialization classes for magical abilities denoted by the color of the Champion's card suit — Serpent Magic, Moon Magic, Dragon Magic and Chaos Magic. Thus, each Champion has his or her own unique characteristics, in addition to their physical statistics. All have varying levels of Strength, Agility, and so on, but the most important characteristic of all turns out to be overall Vitality.

Forming the Right Party

Each player chooses one Champion to be their party leader, then the game begins. Your first task is to explore the immediate area and "interview" prospective party members to fill out the rest of your party. One unique feature of Bloodwych is the ability to converse with other denizens of the Castle. While the options are fairly limited and the converstation somewhat less than sparkling, this ability to speak to other characters really does add a lot to the game.

You can ask someone's name, what their occupation is, and whether they've heard of anything interesting in the vicinity. You can also engage in "smalltalk," either boasting about your own abilities or praising the other's. If you want, you can try insulting the other person or asking if they have anything to trade or sell. You can offer to sell them extra items you've found in the castle, such as armor or weapons you don't need.

The Champions all start out with the same equipment (10 coins, 5 "common keys," some food and a weapon suitable for their character type), so their possesions don't really enter into the choice of your party. Physical characteristics and Magical Spells owned are the main differences. One very nice feature is that there is both the typical "head and shoulders" picture of each character's face and a full-length picture showing what each one is wearing. You can see them "put on" and "take off" their armor. (No, you *can't* take off *all* their clothes...anyone remember being disapointed that the picture didn't change when Sonja threw her bra across the pit to trigger the floorplate on the other side in Dungeon Master? Hmm...nevermind...I guess you had to be there)

Character Characteristics

As in Dungeon Master, there are both male and female characters to choose from, as well as an array of non-humans (Mr. Flay, the friendly skeleton is one interesting character). Unfortunately, you must accept each one with the name and statistics they come with. Unless you spend a lot of time on the initial screen examining the Champions' statistics, the process of choosing a party can be pretty involved if you're trying to assemble the "perfect" group. When you run into an unattached character, you can greet them and invite them to join your party, but you don't have a chance to see their statistics until they actually join. If you decide you'd rather have someone else in your party, you do have the option of dismissing them.

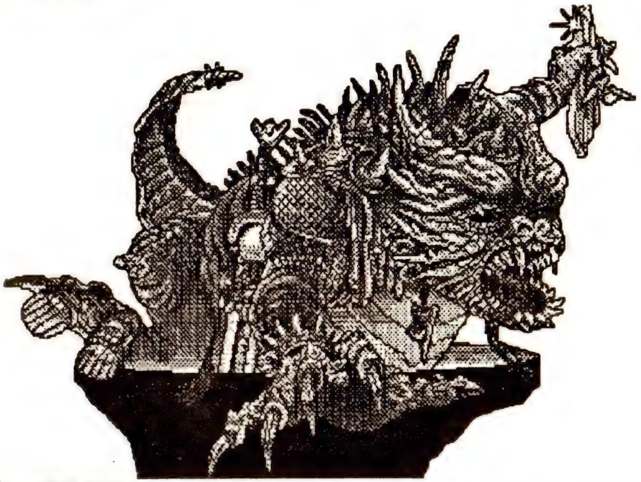
Each character has a backpack with several slots to store things and positions for armor, shields and weapons. An interesting feature of the game is the "spellbook" that each Champion is equipped with. Instead of having to combine magical elements, spells in Bloodwych are cast by "reading" them from the pages of the spellbook. The book itself has eight pages, each with four slots for spells (and a nicely animated "page flipping" effect), for a total of 32 possible spells.

Magic Abilities

Each spell is identified when you click on it, so there's nothing for you to memorize. Spells in the Champion's area of specialization are more likely to succeed, although any character can cast a spell in any of the areas. Putting more magical power into a spell increases the percentage of its working, as well as increasing its effect.

A spell can be cast again and again, but there is a "resting period" enforced before the character can make another attempt. Also, each Champion has a limited amount of magical energy available, and this energy can be recovered by resting. While your party sleeps (hopefully in a safe area), any new levels of experience they've gained through combat will be awarded.

Also, if any of the Champions are ready to receive new spells, the "Spell Faeries" will visit them during sleep and offer to sell them new spells. Yes, in Bloodwych, spells must be *purchased* with gold coins. This means that you must balance the need for more magic against the need to buy armor and other necessities for the party. There are gold coins available here and there in the castle, but (naturally) never enough. It's a good idea to evenly distribute the gold you have, maybe giving a bit more to your Wizard(s), to make sure everyone will be able to gain new spells when they can.



Spell Lists

A lot of the spells don't seem to be particularly effective or valuable, for example "Beguile" and "Paralyze" (did anyone *really* ever cast "Darkness" in Dungeon Master?). My poor Adventurer beguiled the heck out of everyone he met and still got bashed for his trouble. My Wizard hit with spell after spell, and if the monsters were paralyzed, they didn't seem to notice. It certainly didn't slow them down any!

On the other hand, there are several spells that are invaluable in keeping the party alive. It's just a matter of discovering which ones they are and practicing them until they can be cast reliably. Then too, there are still a LOT of empty slots in my characters' spellbooks, so there may be some interesting surprises still in store for me.

Fighting off the Monsters

One of the places where Bloodwych differs very greatly from Dungeon Master is in the way combat is handled. Instead of having to decide what kind of attack each party member will use, then clicking on a selection from a menu for each individual party member for each and every swing of the battle, you only have to click on the "Fight" icon in Bloodwych. The party members will fight continuously until the enemy is killed or you break off the fight by retreating. However, only the Leader is under your direct control. The others will join in as they see fit, giving more of a feeling that this is a group of actual individuals. You can influence the others by "commending" them for their actions, or you can "correct" them if they do something you'd rather they didn't do. This combat setup simplifies battles considerably, which may be attractive to those who found Dungeon Master's fighting to be overly complex. Actually, I preferred the feeling of involvement that Dungeon Master gave. I found it was much more satisfying to direct the action, rather than just observing.

There is also a "Defend" icon, which puts the party into a defensive mode to fend off an attack while you get spells ready or rearrange the order of the party. The only way to break off an attack seems to be to retreat from whoever (or whatever) you're fighting.

Movement through the corridors of Zendick's castle is identical to the way Dungeon Master's movement through the tunnels of Mount Anaias is controlled. You can either click on a set of icons to move you forward, backward, to either side or to turn in place left or right, or you can use a set of keys on the keyboard to move. Again, as in Dungeon Master, the keys for a one player game (or Player 1 in a 2-player game) are the cursor keys for movement, and the Insert and Clr/Home keys to turn in place. Player 2 in a 2-player game can use a group of keys on the left-hand side of the keyboard for movement. As in Dungeon Master, using the keyboard to move your party is far better than trying to click on the rather small icons on the screen.

The Leaders Among Us

Speaking of clicking on icons, I had some difficulty at first when trying to switch Leader status among the party. Each party member can hold a spell ready to be cast, which is the first thing they'll do in a battle. But only the Leader's spellbook is available to you. So, if you want everyone to cast another spell right away, you have to make each party member Leader, select their spell, then make the next person Leader, and so on.

The problem is that the same set of icons is used to set up the "marching order" of the group. I found that in the heat of battle, instead of making my Wizard the Leader, I ended up more often than not exchanging his position with one of the Fighters in the front row, leaving him to face whatever nasty creatures were beating on the group while I frantically tried to get him back in the back row where he belonged! After going through this drill several times, I found that a nice, slow, deliberate "double-click" on a player's icon will make them Leader without changing their places. You've just got to keep your cool in the face of giant crab-things and don't click too fast.

Types of Monsters to Expect

As far as I've gotten in the game, the adversaries have been mostly humanoid. There've been a few skeletons, and the giant crab-things, and a Blue or Green Dragon or two. As in Dungeon Master, it's extremely important to Save the game OFTEN. You never know what may be behind the next door!

Speaking of doors, there's no "Slam the door on the Rockpile Monsters" trick in Bloodwych. Once a creature is into the doorway, you've got a real problem because it's on YOUR side of the door now. Worse yet, the bad guys know how to open some of the doors, so just slamming the door in their faces isn't going to help you! It was a long time before I discovered that you could lock a wooden door shut with the "common keys" each character has and which are available in abundant supply around the castle. I'm still not sure why it is that the bad guys can open a wooden door, but can't figure out how to get an iron grate door open, although I'm glad they can't!

Differences from Dungeon Master

One thing I've noticed is that Bloodwych doesn't have the emphasis on puzzle solving that Dungeon Master had, at least as far as I've gotten into the game. There is a Maze, and I've found that there are "spinners," or floor sections that will turn you around, but nothing like the kinds of things that were introduced as early as Level 2 of Dungeon Master. Then again, I'm pretty sure I've still got a long way to go in Bloodwych, so there's no telling what may lie ahead. By the same token, while there are hidden wall sections, and buttons on the walls to reveal them, the buttons so far have all been easy to spot. Not all of them produce any immediately obvious results though, so you have to be watchful to see what they do.

Another *very* important difference between Bloodwych and Dungeon Master is that there really isn't the same concept of "Levels" in Bloodwych. There are stairways leading up and down, but there are so many, leading in different directions, that it's a little hard to keep track of what "level" you're on. You may go up a stairway only to find youself faced with another stairway that leads back down to another part of the level you just left. Later on, pushing a button may open up a way from the top of those stairs into a higher level. Eventually, in the center of the "first level" you'll find a place where three stairways lead upwards. These will bring you into the area of the castle's towers. There's the Dragon Tower, the Moon Tower, the Chaos Tower, the Serpent Tower (where I'm currently wandering) and Zendick's Tower (where the ultimate confrontation will occur). All of these staircases up and down will make mapping interesting, to say the least!

Two-Player Bloodwych

I haven't played Bloodwych as a 2-player game yet, but I have some reservations about it. The first is related to having to use joysticks. Moving your pointer around with a joystick is awfully slow (excruciatingly slow in fact), compared to using the mouse. Also, the accuracy of hitting the icons on the screen isn't as good as it is with a mouse, so you'll spend more time trying to hit the right spot with your arrow, while monsters are making mincemeat of your characters.

Another real problem is that most of the corridors aren't wide enough for both parties to pass each other, so you may find your retreat cut off by being blocked by the other player's party. It'll take a LOT of coordination between the players to avoid having one party get beat up while the other party is in the way. It IS possible to try to maneuver around a monster so one group can hit it from the front while the other group attacks from its back, so it may not be as great a problem as I suspect it will be.

One of my first thoughts about playing this kind of game with two players was that you could have one group of Champions go off and explore one tower while the other group explores another. In playing Bloodwych so far though, it's been pretty "linear." That is, you "can't get in here until you've gotten in there." Sending a group off on its own looks as if it would be fairly futile, since they wouldn't have the keys necessary to go anywhere other than where the second group is exploring.

Feeding the Adventurers

There also isn't enough food in the castle to feed one party of four, much less two groups, although this is only a problem until you discover how to get around needing to feed your Champions.

Even though I think that a "serious" attempt to win the game would be better off done with the mouse controls and somewhat greater freedom of movement of a 1-player game, it still sounds as though it would be great fun just playing a "Dungeon Master" style game with another person.

The graphics in the game are very good, even though I've heard one complaint that the colors are too bright. This may actually be due to the fact that the corridors of the castle are brightly lit, with no need to provide your own light source. It's quite a change from Dungeon Master, where you always had to have a torch or magic light spell handy.

The sound effects in Bloodwych aren't as good as in Dungeon Master, although they're not bad by any standards. The game uses virtually the same Save game setup as Dungeon Master, so you can Save the game out to different disks at different places, or rotate your Save disks so you always have one or two fairly current Saved games. Also, just like Dungeon Master did, the game renames the last Save game with a .BAK extension, so you can always restore to the next most recent Save. Unlike Dungeon Master though, Bloodwych allows you to Load a saved game at any time. This means you don't have to have your party "commit suicide" by throwing fireballs at a nearby wall if you want to start over.

In Summary

Overall, Bloodwych has a lot to offer, both to those who have become tired of waiting for the sequel to Dungeon Master and also to those who haven't yet had the opportunity to experience this kind of graphics adventure game. It's not quite Dungeon Master, but it's a definite winner, with lots of unique features and is *highly* recommended. If you don't buy any other game until Dungeon Master II (*really*) comes out, be sure to buy Bloodwych!

Letter from CEO of Sphere, Inc.

[This "letter" from Gilman Louie recently appeared on CompuServe. The message was posted as a response to Ralph Mariano of ST Report, but it is really aimed at all ST users who have been involved in the heated discussion concerning FALCON and the issue of piracy.]

First off, I want to thank all of those ST users who have supported us by buying FALCON. As of August 25, 1989, we have sold 12,962 units in North America. In addition, we have sold 1,640 FALCON Mission Disks (Operation: Counterstrike) since the beginning of the month. For the statisticians, total sales in August for ST FALCON were 202 units as compared to 836 for the Amiga, 1,151 for the IBM and 1,167 for the Mac version.

By the way, I have not been giving the ST users the "Silent Treatment" as you claim; it's just that some of us are trying to get new products out, such as the Mission Disk, and feel that this is the best way to support ST users. The ST users who have bought our products have been wonderful. They have shown that there is a market for the ST in the United States, and they deserve the support of other software companies. Many have written to me or left messages on on-line services.

ST users are fed up with piracy and have turned in a number of "pirate boards" to us. We, in turn, have turned these over to the Software Publishers Association (SPA). These boards should not be allowed to ruin the market for the rest of us.

While we were once again disappointed to see that the Mission Disk for FALCON (the Mirrorsoft version) appeared on the bulletin boards before we even released it here in the United States, we are not going to let it distract us from servicing honest ST users. As long as there is a market, we will support it.

It has never been our intent to slander the ST market but rather to help educate the user base about some of the frustrations of being a publisher, programmer or developer. You have helped us better understand some of the frustrations users must go through. We have taken off the disk-based copy protection on the Mission Disk and upgrade for ST FALCON as a way of say "thanks for being honest."

Thanks for all of the comments and letters. It has been an educational experience for all of us here at Sphere.

Sincerely,
Gilman G. Louie CEO/Chairman Sphere, Inc.

The Right Brain

by Paul D. Stampfli (El Paso)

I just hate it when I get let down. I just don't do well with disappointment. And I am seriously let down by Mr. Gilman (Chopstick) Louie and the folks over at Spectrum HoloByte, or Sphere, Inc. or whoever the heck it is that's responsible for Falcon.

I know all about the letter that good old "Chopstick" wrote about all of us pirates that happen to use Ataris. And I know that we stood up together and fired a few rounds back. And I know that Mr. Louie said that it was all a mistake and that he would apologize in writing. I'm still waiting.

Up until the 24th of August I was still waiting for my update and mission disk for Falcon, too. See, I BOUGHT (are you listening "Chopstick?") Falcon quite some time ago — one of the first six copies that Jenkins' (our local authorized Atari dealer) got originally. Although I spend most of my hours on the ST in productivity pursuits, I do like to play now and then, and this looked like something SERIOUS that you could play with. It was; I was thrilled. I still liked it when Tim (our User Group Prez and a fairly hot "pilot") found out about Control-X and started routinely kicking me out of the sky. (He will ripple fire four AIM 9L's at me and I just can't seem to get away from them all. Watch him when you're up there!)

So, back in July, I got a notice to upgrade and an option to purchase the mission disk along with the upgrade at a fair price. At least, I thought it was fair ($24.95). So, I sent my check out on the 18th of July and then I started to wait. My bank statement came in mid-August and the check hadn't been cashed so I thought, well, maybe it got delayed in the mail. Tim went to the Dallas World of Atari around the 19th of August and came back with the mission disk that he had purchased for $10. Jenkins' got it in at the same time, give or take a couple of days. He was selling it for $24.95.

Now that's retail, you have to figure that standard dealer mark-up is ABOUT fourty percent. So, Spectrum gave it to the dealers AND the consumers in the shorts, hard and fast. Like I said, I got my copy on the 24th, and it wasn't delayed in the mail, either. (I checked the postmark date.) Now what did the advertisement say that got me to order from the company direct? It said that if you bought the mission disk, your upgrade to 1.1 was free. I got this flash for you Mr. Louie, that ain't free. Not for me and certainly not for Jenkins'.

My major gripe is simply this: Spectrum HoloByte told me they would give me something free if I bought something else, sight unseen. I think I have the right to expect a fair price and a timely shipment. Apparently, I do not. I also think the dealer has the right not to have the parent company undersell him "on the street;" apparently, he does not. Sounds just too, too cute if you happen to be Spectrum, doesn't it?

(I don't intend to review the game for you here, that's Tim's domain, but I would like to make a few comments about it. You have to understand that I've only played it a couple of times so I could be mistaken about some of the features.)

The Spectrum HoloByte Falcon Mission Disk runs a CAMPAIGN, not just isolated missions. Try as I might I can't seem to find a SAVE feature so that I can return to a stopping point. This is a SERIOUS failing of the program in my opinion. If you have ever played this game, especially over the modem, you know how long it can be, and to have to start all over again every time you come up is just a waste of effort.

Spectrum Holobyte makes a lot of comments in their new documentation about copy protection. They even put a cute little pink slip in the package signed by Mr. Louie, CEO, and Mr. Phillip G. Adam, President, extolling the valor, fidelity, time, trouble, and money that it has cost them to bring this product to you poor little Atari users. They mention that the product is not copy protected in about six different places. It's enough to make me want to barf my socks. Cut me some slack guys! YES, you spent some money on the product, but you sure as the devil didn't GIVE it away, and certainly not to me. YES, there are pirates out there, and they hurt your pocket book, but the fact that I'm not 100% caucasian doesn't make me a commie, and the fact that I own an Atari doesn't make me a pirate.

You've got some serious lessons to learn in dealing with PEOPLE, guys. Let me try to help you a little. 1) Don't stereotype. If you don't believe that, just refresh your memories of the sixties. 2) Service your user base FIRST. These are the people that spent their hard-earned money on you in the first place, They are the reason for your success. I, for one,

It Must've Been Something I Ate

by Tim Sharpe (CACE)

It was one of those dreams you have right before you wake up, the kind that seem all too real. Ah, I remember it well (i.e., flashback now in progress)...

It took place at the Summer Consumer Electronics Show. As I wandered through the myriad of booths, filled with all sorts of neat gidgets and gadgets, an immense awe filled my being. Here, in one place, were all the newest and latest products of every big name in the computer and electronics business. I gazed in wonder as I passed each booth.

And then, at a dead-end section of the showroom, I found the Atari booth. It was filled entirely with calculators.

"Calculators!" shouted the man in the booth. "Getcher red-hot calculators!"

So this is what it had finally come down to, I thought. "Why?" I gurgled.

"Pardon me?" the man said.

I somehow managed to compose myself. "Why are there only calculators here? What happened to the Atari computers?"

"Well, we're trying to get rid of our games-machine image once and for all. No more computers or home video machines. Just good, practical calculators."

I considered this for a moment. It IS rather difficult to label a company that only makes calculators a "games-machine" company. About the only fun a person can have with a calculator is turning it upside-down and trying to spell cuss words or "shelloil." Still, this action seemed to me a little extreme.

"No more XE's or STs?" I queried.

"Nope," he said. "But take a look at one of these babies." He handed me a calculator with a flat, wooden stick protruding from the bottom side.

"What's this?" I asked, fearing the reply.

"An ATARI popsilator: looks like a popsicle, works like a calculator. Oughta go over great with the kids."

"Does it come with a wrapper?" I asked sarcastically.

"Now don't get smart with me," he admonished. "I don't have to put up with this—look." He pointed at my chest.

I looked down at my shirt and found an I.D. tag pinned on it. The tag read "Dream Visitor."

He continued. "This is one of our more promising models. It can be linked together by modem with another of its type."

I stared at him blankly.

"Well don't ya get it? One student can do his math homework on his calculator, while another student miles away gets a copy of the answers."

After a moment I said, "Surely you can't be serious." We then launched into a brief comedy routine that began with "Yes, and don't call me Shirley" and ended with me shoving a pie in his face. You know how silly dreams can get.

The last thing I remember saying was "Does Jack know about this?" Then I woke up.

As the real world imposed itself upon me, I suddenly became very thankful that Atari still made computers, and that they hadn't given up on us yet.

But you know what's stranger than fiction...

The Right Brain (continued)

take it as a slap in the face to be serviced LAST because I had enough faith in your company to order a product sight unseen, delivery date unknown, just on the basis of what you did in the past. 3) Honor your word, I think you know you made a mistake when you called us all pirates, but you said you would do something (apologize) and didn't. What does that make you?

The Atari community needs software developers and vendors, especially the high end, quality product that Spectrum HoloByte has a reputation for producing. However, it does not need a condescending Big Brother overseeing it's markets. The stuff you wrote in your documentation on copy protection made it sound like the entire Atari community was on probation with your company.

Let me take one of us off probation right now. I don't like your attitude; I don't like your support; and, I don't even like the new mission disk. I will NOT support your company, and therefore you, any more by purchasing your software. Oh, and by the way, did you even recognize the photo of the F16 on the mission disk folder is a configuration that CANNOT be achieved with your game? Now that's what I call attention to detail.

Till next time!

32,768 Color Support for the Atari ST

by Barry Orlando

For Public Domain, dated 9-9-89. Printed by permission of the author.

Here's a hardware modification for the standard Atari ST that increases the color palette from 512 colors to 32,768 colors (32 shades of gray), while still maintaining compatibility with existing Atari ST software (including SPECTRUM 512). This upgrade is software compatible with JRI's 4096C color board and will also be compatible with the recently announced 4096 color STE (Enhanced ST).

It does this by adding increased bits of resolution so as to increase the ST's 16 read/write color palette hardware registers from their standard 9 bits each to 15 bits each. Each of the standard color palette registers have the following bit arrangement:

```
FEDCBA9876543210
.....RRR.GGG.BBB
```

where, R, G, and B are the red, green, and blue components.

The higher the value for any of these grouped bits, the more intense the resulting color component. The above bits marked '.' are ignored.

The JRI 4096C color board and the upcoming 4096 color STE add an extra bit of resolution at bit locations 3, 7, and B, however these new bits are least significant bits so as to maintain compatibility with existing software.

The 32,768 color modification goes a step further by adding a fifth (and less significant) bit to each color component at locations C, D, and E. The new arrangement is then:

```
FEDCBA9876543210
.RGBRRRRGGGGBBBB
```

As with the JRI 4096C color board, this modification adds an additional Shifter chip. However this modification is slightly more involved in that it uses three additional integrated circuits and bypasses nine 5% tolerance resistors used by the Shifter chip, in favor of using nine 1% tolerance resistors.

Disclaimer of Liability

This modification should only be attempted by someone with experience repairing or building digital electronic circuits. Performing this modification will be done at your own risk and may void the warranty on your computer.

Parts Used

Qty	Description/Source/Cost
1	Component Perfboard (3"x2.5") cut from Radio Shack #276-147 ($2.99).
2	3M Board Mounting Interconnectors (straight single-row male). Digi-Key Part # 929834-08-36 ($2.05 each).

Digi-Key Corp. 701 Brooks Ave South, P.O Box 677, Thief River Falls, MN 56701-0677. Phone 1-800-344-4539 for a free catalog.

1	Quad 2 input NAND Gate, High Speed CMOS (74HC00N). Digi-Key Corp., Part # MM74-HC00N ($0.28).
1	Quad Tri-State Transceiver, High Speed CMOS (74H-C243N). Digi-Key Corp., Part # MM74HC243N ($0.78).
1	Octal Tri-State Transceiver, High Speed CMOS (74HC245N). Digi-Key Corp., Part # MM74-HC245N ($0.82).
5 ea:	3.76K, 7.50K, 15.0K, 30.1K, 60.4K ohm metal film resistors, 1%, 1/4 watt. Digi-Key Corp., Part #s 3.76X, 7.50X, 15.0X, 30.1X, 60.4X (each value: 5 for $0.50)
2	3.0K ohm carbon resistors, 5%, 1/4 watt. Digi-Key Corp., Part # 3.0E (5 for $0.25)
5	0.1ufd Monolithic Ceramic capacitors, Radial, 50V, 10%, or equivalent substitution, Digi-Key Corp. Part # P4525 ($0.19 each)
2	Shifter Chips, Atari Part # CO25914-38A. One chip is obtained from your ST's motherboard, the other from your local Atari Authorized Service Center ($30.00)

Installation of the Board

Located on the ST's motherboard is mounted a sheet metal box which houses the Shifter Chip. This box has a hinged lid which can be opened. Inside this box you'll find the Shifter Chip mounted in a 40 pin socket.

The board simply plugs into this socket so that the board is elevated above the ST's motherboard with sufficient clearance to allow closing the hinged lid.

Three wires are installed from the color board to three vias (trace thru holes) located nearby on the motherboard.

Additionally, jumpers are installed across each of three 3.6K ohm resistors on the motherboard. These resistors are easily traced from the Shifter socket pins 21, 24, and 27.

Board Assembly

Because the sheet metal box (discussed above) does not allow a lot of head clearance, all components are mounted directly to the perfboard. If you use chip sockets, the hinged lid will not fit back on without modification.

The diagram shows the orientation of components. I soldered all the components to the perfboard, then soldered all the connections using 30 gauge Kynar wire wrap solid conductor wire (Radio Shack 278-502).

There is a slight modification to the circuit if you have any RAM chips installed in your ST which are 150 nanosecond (i.e., slower than 120 nanosecond). Pin 1 (DIR) of the 74HC245N must be tied to ground instead of to the R/W line on the Shifter. This will only disable the read capability for bits C, D, and E of each color palette register mentioned above.

Software

Included with this article is a program to display all gray levels and colors. This is a very crude program but was intended to only prove that the circuit works. The C source code provides the engine for converting basic color intensities to board compatible bit patterns.

```
/* 32,768 Color Board Tester for Palette Register at location $FF8240 */
/* by Barry Orlando in Mark Williams C */
/* This program displays the 32 grey levels and then */
/* the 32,768 colors in sequence using background palette 0 */
#include <stdio.h>

Turbo-Info # 4

New 65C816 Registers

by Chuck Steinman (DataQue)

This is the fourth part of a multi-part information article on the Turbo-816 from DataQue Software for the Atari XL/XE computers. The previous installments went over the basic system, memory and OS. This article will cover some of the new 65C816 addressing modes.

The 65C816 is a 16bit processor, which also has the capability of executing 8bit 6502 instructions. To allow for this, there are two operating modes for the CPU, the EMULATION mode and the NATIVE mode. The emulation mode, as it implies, will fully simulate a 6502. The native mode opens up the full power of the new processor.

The 65C816 Cpu

Even while in the emulation mode, many new instructions are available. Some are of little use because of being limited to the 64K addressing range of the 6502. Many of the new instructions allow for smaller, faster code. Other instructions offer power which was previously not feasable or practical.

Because of the limited 16bit addressing range of the 6502, the designers of the 65C816 realized that if their new processor was to survive, it must be able to address more than 64K while still maintaining 6502 compatibility. This was done by using multiplexing which adds another eight lines to the address bus. This new 24bit address bus allows for a full 16 megabyte range.

Obviously, there was no inherent way to control these extra eight lines with the 6502 instruction set, so new instructions and addressing modes would have to be added.

To maintain 6502 compatibility, there would be certain limits to the functionality of those lines while in the 6502 emulation mode. There must also be the addition of several new registers to allow for dynamic control of the state of the new address lines.

Features of the 65C816

There are two new registers in the 65C816 that control the eight new address lines. The B register controls the new lines during access to data memory. This would be any time that you would be loading, storing or doing manipulations to data external to the processor. This register is also known as the DATA BANK register.

The K register is used any time that program memory is being accessed. This would be when the CPU is fetching an instruction and its operands. This register is also known as the PROGRAM BANK register. Both of these registers are eight bits wide.

It should be emphasized that the B and K registers are not used in the emulation mode on the T816, so they could be used as general purpose registers. Because of this, while in the emulation mode, the CPU is limited to the base 64K of memory. This lowest 64K is where the stock XL/XE motherboard resides in the memory map. The CPU, and Turbo-816, power up in the emulation state, to maintain compatibility with the 6502.

In the native mode, the B and K registers are appended to the normal 16bit addresses. This allows for expanded addressing, even while still executing the standard 6502 instructions.

There are two other registers which should be mentioned at this time. In the 6502, the lowest 256 bytes of memory had special addressing modes. They were called "Zero Page Addressing."

There were several variations of zero page addressing depending on which, if any, index registers were used, and also if the data was loaded directly or indirectly. The 65C816 expands this addressing mode by allowing this same addressing mode throughout the base 64K. The register that allows this to be done is the D, or Direct, register.

The D register is 16bits wide. The contents of this register are added to the user supplied operand, to form the 16bit address. This register is active whether in native or emulation mode, which causes some programmers grief, as they assume it is always on page zero while in the emulation mode.

The last register is really just an extension to an existing register. With the 6502, there was the limitation of only having a small 256 byte stack range. This limited use in applications where heavy parameter passing and stack usage were required. The 65C816 allows the stack to be located anywhere in the base 64K, and in the native mode, the stack can be up to a full 64K in theory.

A common mistake made here is that programmers forget that the stack is always located on page one, and always 256 bytes in size while in the emulation mode. Also, people assume that in the native mode the stack wraps around within the current page.

Another feature of the 65C816 is that the index registers (X & Y) and accumulator (A) may be either 8bits or 16bits in size while in the native mode. The index registers are always the same size, but the accumulator may be separately sized. Of course while in the emulation mode, all three registers are limited to eight bits.

Any time you switch between native and emulation mode the registers will be forced to eight bits. The upper byte of the index registers will also be lost. The upper byte of the accumulator will be retained while in the emulation mode but only accessible through the XBA instruction. Memory accesses will always take on the size of the accumulator. This is easily overlooked, especially with the shift and rotate instructions.

Another control function is the E bit in the status register. This bit controls whether the Turbo-816 and CPU are in the emulation or native mode. This bit is changed by using the CLC or SEC instruction followed by the XCE instruction. This instruction exchanges the Carry flag with the emulation flag. In this way, you can switch modes easily, and also know which mode you were switching out of (by the returned carry).

There are several additional control pseudo-registers in the Turbo-816 that are controlled by the CPU and ANTIC. This allows access to the full 16Mb of address space with the CPU, while limiting ANTIC, GTIA, POKEY, and the PIA to the lowest 64K. These registers are not user accessible directly but are controlled via functions of the CPU and ANTIC hardware.

Below is a table including technical information on the most popular Seagate hard drives. This table includes data on each drive's capacity, number of heads and cylinders, et cetera. This table accompanies the article by Ralph Mariano found on the following page.

ST 412 Drives with MFM Encoding (5.0 megabits/sec)

	ST125	ST138	ST225	ST251	ST251-1
Mb Formatted	21	32	21	42	42

Hard Drive Myths and Mysteries

by R.F. Mariano

[Continuing our series on the ins and outs of hard drives, this month we have a submission from Ralph Mariano of ABCO Computer Electronics, Inc. (and ST Report).]

To begin, 99% of all hard disks are made to conform to IBM standards. With this thought in mind, we shall proceed... The most readily available, and in my opinion the most reliable and economical, hard disk mechanism is from Seagate... next in line is the Miniscribe. There are others, but you must make sure they conform to the IBM standard — ST-506/ST-412

MFM is the most commonly found format style in use, although recently, RLL has been becoming far more popular as it is a condensed, compact format allowing more data to be stored on an equivalent size hard disk. The major difference in RLL compatible drives is that the media itself in the hard disk is PLATED to insure accuracy and longevity.

Most commonly found hard drives do not have controllers built in. These are the most reliable and economical drives to use. Recently (in the past six months), great strides have been made in the technology and reliability of the embedded controller drives. In fact, it is easy to say that the embedded drive is the drive of the future. In the long run, the user is better off with the new embedded drives...if for no other reason than there are less individual component parts to fail and less of a load on the power supplies.

The actual chain of connection for a hard drive is: Hard Disk to Controller to Interface (Host Adapter) and the DMA or SCSI (scuzzy) port on your computer or hard disk (embedded controller) to Host Adapter to Computer.

Controllers

What is the Controller? This goodie is the custodian of your hard disk! It directs all I/O functions to the hard disk and it points to and accesses each cylinder.

The two most widely used, and I might add the most abundant and reliable, controllers are made by Adaptek. They are designed with the user in mind and provide for expansion in the future.

The Adaptek ACB-4000A is used to interface SCSI drive type ST506/412, while the ACB-4070 interfaces to ST506/412 RLL-Certified drives. NOTE: The 4070 does require shielding when mounted close to the drive.

The Adaptek 5500 type controller is MFM only and can handle four hard drive/SCSI devices. This type of controller is ideal where a BBS is concerned and interior cabinet space is at a premium. The other controllers available will handle only 2 devices.

OMTI offers the fast controller. That is, the 3500 series of controllers offer a speed increase on any hard disk of at least 15% and are RLL and MFM.

The following hard disk systems are special in that they have embedded controllers (all are SCSI drive types unless otherwise indicated):

IOMEGA
    ALPHA 10H, 10mb, Cartridge
    BETA XXX, XXmb Cartridge
RODIME
    RO650, 10mb
    RO652 interface, 20mb
SEAGATE
    ST138N interface, 30mb, 3.5 inch
    ST225N interface, 20mb, 5.25 inch

NOTE: Seagate has many more embedded drives... all Seagate embedded controller drives use the suffix "N".

WESTERN DIGITAL
    WD1002-SHD, SASI, ST506/412
XEBEC
    1410 and 1410A, SASI, ST506/412

These SASI devices are slowly fading into the sunset...

Hard Disk Interface

In most cases, the Interface (Host Adapter) determines what type of computer system the hard disk will comply with. In reality, you can take a hard drive system made for an 8bit XL/XE, change the Interface to one for an ST and it will now work on the ST (after a format).

There are four types available for the ST: Atari, ICD, Supra, and Berkley. The most popular is the ICD Host Adapter.

The ICD Host Adapter is designed for the ST hard drive or for most anything you care to connect to it (i.e., tape backup, hard disk, laser printer, etc.). ICD uses the finest in noise limiting circuitry, thus allowing the use of longer DMA cables. Up to 6 ft has been tested and approved for use with ABCO Hard Disk Systems.

ICD also provides a fine hard disk utility program called "CleanUp" that recognizes the ICD Host Adapter and then proceeds about its duties. Users would also be well advised to periodically check the performance of their hard disk systems with ICD's RATEHD.PRG and SCSI_ID.PRG.

Please note that I have not mentioned other Host Adapters...rather than "bad mouth," it's best that nothing be said.

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts is the Atari Club in and around the Jackson County area. The main purpose of the club is to help inform new users, and to promote the use of the Atari Computer in the community.

President	Brent Fisher	(517) 764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The C.A.C.E. BBS, is run by the club and is open to anyone with a modem. The number to call is 1-517-787-4011. The current membership dues are $14.80 per year, and are payable at any of the C.A.C.E. monthly meetings, or by mail to the P.O. Box. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter.

Any written communication with C.A.C.E. should be sent to: P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place in the basement of the East Side Lounge at 2214 East Ganson, Jackson, Mi.

Fishin' Around by Brent Fisher

Good day and welcome to the month of October. Well, ok maybe you will receive this after October. I am still looking for my September issue.

Our next meeting is to be held on Sunday October 8th at one p.m. over at the East Side Lounge, and for those of you who don't receive their magazine until November, that meeting will take place on the 12th. For the latest information on the meetings you can call me at home, or if you have a modem call the CACE BBS at 1-517-787-4011.

There is not too much to tell about last month's meeting, except that it was pretty much a gab session, with discussion of the (probably not) forthcoming GOE cartridge and what has been happening in the 8bit market.

I have to admit I was a bit impressed that ANALOG decided to do an article on Star Trek the Next Generation television series. I was also impressed that they had so much color in the magazine, especially since we havn't seen that much in a long time. Still it does not make up for content. Next month should be interesting since ANALOG is once more merging ST-LOG into it's pages again.

This also brings up an interesting subject, what is going on with Antic? I haven't received my October 1989 issue from them yet. Does anyone have anything to report on them? Are they still in business? I usually receive my issues a couple of weeks before I get ANALOG.

Last month I reported about Atari's upgrade offer on trading in your old disk drive and some money or a new one. According to customer service I should receive my new drive in three weeks. I sent in the old 1050 on September 11th. So I should have my new drive by the time you read this, but knowing Atari, you never know. I'll let you all know what is happening in my next column.

To put everyone's mind at ease, I have fully recovered from the Michigan-Notre Dame game. I should be myself again in time for the game next year. So I'll see all of you at the meeting.

Central Connecticut Computer Club

The Central Connecticut Computer Club is the oldest, still operational Atari club in the state. Conceived in December of 1980, and operational in January of 1981, the CCCC continues to serve the Atari community. New blood is welcomed, and of course, old hands are always welcomed back.

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at Eastern Computer Video, 1207 Meriden-Waterbury Turnpike, Milldale, Ct. 06467.

Prospective members may call Rich Scheidel (203)589-9035 or 589-3738. Failing that, call Tim Brandt, (203)283-0500, or write, CCCC, 127 Pinnacle Rd., Bristol, Ct. 06010.

Dues are $25.00 per year,$30.00 for family plan. Includes Voting membership, Newsletter, access to Club library (8-bit and ST), access to Club magazine library , discounts on computer and video supplies at Eastern Computer-Video, and access to the Club message base at Ultra Project BBS.

GREETINGS! September is here and hurricane Hugo is about to make history in a few hours as it whomps the mainland.

I write this on the last full day of a summer. Summers have traditionally been sparsely attended due to, of course, vacations and later hours for personal activities. However....I kind of wonder when I and one other faithful member of CCCC are the only ones that show up for a meeting....TWO months in a row.

Where has the club failed? Did we not try to entertain you to the best of our abilities? Were you bored with the content of the club or the activities that were presented? Did it ever occur to you that you could voice an opinion and change the direction of the club? Did you ever think that you could get involved and help the club?

Like I said, the end of summer is at hand. More and more of you are going to be blowing off the dust on your machines or are going to be sitting at them a little longer. Your interest in the old Atari is going to rise a bit. This is the way it's always been. You are probably going to go to a club meeting.

Lucky for you, we are still here. Due in no small way to the dedicated core of the club. If it was up to the general membership to have kept the ball rolling.... , well enough of that. We ARE still here, and we have a new look. We have eliminated the MAJOR stumbling block of the club, that is, PLEADING for news articles and submissions for our newsletter. Now it's safe to come back. This new look is actually AIM. Your paid membership is going to get you a full year subscription! All that's required, is that I or one of the other officers send in club news and a monthly column and we're home free! They even accept articles from our membership (just in case it ever happens).

If you were EVER a member of CCCC, you will receive several issues of AIM. If you wish to come back, be my guest. We do wish the club to succeed and flourish. The Officers of CCCC are checking into the possibility of a Connecticut-wide club. Pay dues at ANY club, and belong to all. The possibility of attending any CCCC, STARR, STATUS, or FACE meeting. How does that sound? The ideas are just starting to be knocked around. Come on in....give us a hand.

GKAUG GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets next on Saturday, October 14, 1989. Dues are $25/yr and include a subscription to Atari Interface Magazine.

President	Frank Fellheimer	657-6106
Vice President	Dan Youngs	
Treasurer	Open	
Archiver	Dave Oldenburg	
Librarian	Bill Berner	
SysOp	Alex Stevens	
GKAUG BBS		(616) 657-2665

Attendence at the September meeting was five members. This is not too bad when you know that we have ten members total. We just seem to have difficulty keeping the club going. Some of the officers have held their positions for over two years, and cannot continue. There has been reluctance by most to holding an officers position. The meetings center around the 8Bit more than the ST because that's what most of our members have. I keep wondering what happened to the ST users out there?

Because of the loss of several people last year, the club discussed maybe merging with MACE and starting a chapter on this side of the state. We could attend their meetings by car pooling over there, or hold an informal meeting somewhere in Kalamazoo. By joining MACE we can obtain software from their library, the fees would be reduced from our $25 charge, and you would know that there are a lot of other people with your type of computer (8 or ST) out there. More on this in the next newsletter.

Treasurer reported $69.88 in the club account. It is time to renew the clubs subscription to ANALOG. Our current subscription expires in Nov. We may not have enough funds to keep this if membership declines. The club has obtained several new public domain programs from members that attended the World of Atari show in Dearborn. These are now in the club library.

We have decided to have the next meeting at STAR-WORLD in Portage. The address is 6151 S. Westnedge Ave. Just think, after the meeting there are facilities for lunch, and an arcade room with REAL ATARI ARCADE GAMES!! Please note the time change to 11:30am.

Frank let us look at the 80 column, word processing program, "RICH MAN'S 80 COLUMN WORD PROCESSOR". It works very well, has search/replace, block delete/insertion, print to disk, and built in help functions. The display looked good on our color TV, so I think it would look even better on a monochrome monitor. It will even accept text files from Speedscript or TextPro. It is available from Computer Software Services. Phone them at (716) 467-9326.

Thats all for now. See you at the next meeting (probably in the Atari HARD DRIVING game) at STAR WORLD.

David Bryant
Treasurer

Great Lakes Atari ST Support 'GLASS', Michigans only 'ST' only Users Group
I ♡ My ST!

Meetings - First Thrusday every month, 6 p.m. to 9:30 p.m., Athens High School, 4333 John R, Troy, Mi., 1/10 north of Wattles <17 Mile> - Room 1528 - Mailing Address - P.O. Box 99737, Troy, Mi. 48098 -- Steve Mileski, president

Dues - $1.00 per month, ie:join in April - pay $9.00, all memberships expire on January 1, each year. Non-members welcome at no charge.

GRASS
GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

Next Meeting: Wednesday, November 1st, 6:30 p.m. Wyoming Public Library, 3350 Michael S.W.

Terry Reine	Membership	(616)698-7244

President's Monthly: 17 September 1989

Greetings fellow Atarians; with club news still a little slow, I thought I would share a little information that I came across in a recent issue of OnLine Today, the monthly publication of CompuServe. In the September, 1989 table of contents, I came accross an article entitled 'An Orphan Survives'. My first thought was for my trusty Atari, but I was mistaken, the article was about the TI-99/4A from Texas Instruments.

It seems that the user base of the TI is still very high and more exciting then when they were being produced between 1980 and 1983. The reason for this prolonged useage of a machine with little support by the manufacturer is described as a strong user group base and the support of a couple venders who still find it profitable to support the TI. The article describes several innovations that have been added to the available hardware lately. User innovation was also listed as one of the TI's strong points, with new younger users getting theirs at garage sales and flea markets for less than $25.

After reading the article, I had the feeling of reading a future article about the 8bit Atari. It does have a strong user group base, and many young people are still getting them new and used. I also think there are far more Atari 8bits then TI's, so as long as we users continue to support them, there will be third party distributers who will continue to provide service to us.

As much as I hate to repeat what has already been echoed to death, Atari Corp. seems to support the XL-XE lines only so far as games go. I am impressed with some of the newest XEGS games, but I do not want my Atari for games alone. I want to learn with it, to use it well into the next decade beyond. To expand it as new technology becomes available, someone has to convert that technology to the Atari, and as long as they can make a buck doing it, someone will. The new 816 CPU chip is a good example, and if it sells really good, others companies will develop more uses for it.

I guess the moral to this story is not to give up on your Atari; use it; love it; learn with it; and, explore with it. If you develop a new idea or project, don't just sit on it without passing it around. These are the ideas that cause new products, new programs, new uses, and a continued appeal for the Atari as a productive, useful, and exciting computer. Pass your programs to the public domain, and above all, support the venders who support you.

Now that I have rambled too much, let me say "COME TO YOUR USER GROUP MEETING." See you in November.

Layton ACE of Utah

President:	Irwin Brooks	(801) 731-1516
Vice-President:	Richard Clark Jr.	825-5823
Sec'y/Treasurer:	Ken Karchner	776-8015
ST Librarian:	Jerry Kennedy	479-3635
8bit Librarian:	Dave Young	776-6273

Next LACE Club Meeting: Mark your calendar for Wednesday, 11 October 1989 at the Clearfield branch of the Davis County Library from 7 to 8:30 p.m.

President's Column

I recently had an experience that I wish to relate to you. My 520 ST had been trying to quit on me. Whenever I had it on for more than 15 minutes it would randomly bomb out. Then I would have to let it sit for hours to cool down before I could use it again (or so I thought). And, as time went on it got progressively worse. My wife uses it on a weekly basis to do the church bulletin, and she was getting angry with it, and me, for not having it fixed. However, visions of having to box it up to withstand a deliberate drop of one foot to see if it was well packed, only to find the factory box didn't quite cut it, did not excite me. Nor did having to buy a new one just because the pieces, though enough to make a 520 ST, did not qualify for a trade-in exchange. So, I waited until the last minute.

Complete frustration was what I felt when right in the middle of a long distance download, the computer bombed. So, I'd call back and start the process over again as quickly as I could to minimize the computer on-time. Good idea, huh? Not good enough! I must have tried at least three times before I gave up after I decided that it must be cheaper to get it repaired than to pay for long distance calls that are cut short.

I took my computer in hand to a local repairman. I must have seemed like a father with a wife in labor, for all of the annoying phone calls and visits to the repairman. What I did find out was that it failed for him just like it had failed for me. My conscience was slightly at ease knowing that it wasn't some evil in my powerline or some mysterious spirit out to get me. However, bad news came a few days later.

The prognosis was that a memory chip failed completely. Okay, I could handle that. But, that's not all. The 520 ST that I had was a REV B motherboard. That's nice, sooo...? The repairman explained that the design that Atari did on the 520 ST rev. B board was the worst (next to rev. A, luckily not many produced). The simple fact is that I can expect problems with it for the rest of its life. Aaaaarg!

In addition, that user installed one meg upgrade will have to be removed. Then to top it off, other memory expansion upgrades might not work either. So, I had a 520 rev B with 0.5 meg that was going to be sick its entire life. Not too promising in my eyes.

A little investigating revealed that a local computer store had some 520 STs for exchange IN STOCK. Computer Connection, on Washington Blvd. in Ogden, had a 520 rev H and rev C. Cost, you ask? My first question too. A mere ninety-five dollars plus tax was all. (The different bottom case was an additional $10.) Is that for a rev H? Yes, was the reply. The fact is, the rev H has a few things that the rev B doesn't. It has the last and best board design that includes the RF output for TV connection and the circuit traces for an easy memory upgrade. I must confess here, the RF output was often considered for later addition to my present 520 ST at an expense in excess of $50. What a deal! Now I'm starting to get excited.

Needless to say, I bought it. In fact, I was so anxious, that I took time off work to go get it and check it out.

I'm almost thrilled with my new child, a 520 ST rev H motherboard. If it had just another 1/2 Meg or more of RAM, I would be even more thrilled. Well, I guess that story will have to be told in another issue.

The MORAL of this story is: If you have a 520 ST rev A or B and it suddenly starts to act up, trade up with the Atari trade-in. Even if it means removing the extra memory, it will be worth it.

Irwin Brooks

For Sale: ATARI MEGA ST2
W/50 MB INTERNAL HD

- Standard MEGA ST2 with TOS 1.2
- Blitter graphics chip
- Includes SM124 monochrome monitor
- Includes INTERNAL ICD ST host adapter
- Dual color LED shows both floppy and HD busy light
- Only case modification is 2nd power switch on rear
- Perfect, scratch free cases, 4 months old.

Price: $2000

MACE
MICHIGAN-ATARI-COMPUTER-ENTHUSIASTS

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Ed Hanson at (313) 675-0044 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

MACE WeST	(313)582-0657	(3/12/2400)

Molin's Den	(313)420-0407	(3/1200)

The September meeting of the Michigan Atari Computer Enthusiasts was held on Tuesday, 9/19, in the Southfield Civic Center. President Bill Rayl called the meeting to order at 7:45pm. Bill announced that a special guest speaker from Michtron had contacted him earlier to send his last minute regrets that he could not attend the meeting. Michtron DID, however, send a copy of ProText and a stack of 30 ProText demo disks for free distribution. Raffle tickets were sold throughout the first half of the meeting for the drawing that would take place after intermission.

Bill also announced there were two new submissions to the ST disk library that evening, one of which was a new graphics/sound demo called "The Snowman," and the other a double sided disk full of new P.D./Shareware goodies including VanTerm v3.8, PinHead v1.4, DCopy v3.2a, and others.

Bill announced MACE officer elections would take place during this meeting, and read the "job descriptions" from the Constitution. The election was held immediately, with the following results: Ed Hanson, President; Ted Newkumet, Vice President; Brian Wilmoth, Recording Sec'y; Jim Nichols, Treasurer; Bill Boles, Editor and Membership; Anton Malje, 8Bit Librarian; Bob Retelle, ST Librarian; and Mark Tappen, Corresponding Sec'y.

The position of Meeting Coordinator was left unfilled, giving the new officers an immediate official challenge. *(Congratulations to all of you, with best wishes for a prosperous and successful term! -Mike)*

After intermission, Bill Rayl demonstrated several of the programs from the disk special, showing particular interest in the new version of VanTerm. Bill also demonstrated Bloodwych, a Dungeon-Master-like game for one or two players.

Bill Boles walked away the happy winner of the raffle for ProText, which he will hopefully put to good use in the coming year as the club's new editor!

Bill Rayl announced that the October meeting (10/17) would feature a Swap Night, so bring your unwanted Atari periphenalia to sell at the meeting!. Bill adjourned the meeting at 9:30pm, thus officially turning over the reins to the new officers.

MID-OHIO
ATARI USER
GROUP

Mid-Ohio Atari User's Group, Post Office Box 134, Ontario, OH 44862

Well here we are people, in our first official AIM newsletter! In case you were not at the last meeting, the group has decided to take AIM up on their User Group magazine subscription plan. I hope that things work out as I feel this is a very good deal.

The members at the September 9th meeting, decided that we would pay for subscription fees to A.I.M. for the current membership, through the end of the year. When dues are collected in January, we will make a decision whether to continue with A.I.M. or to return to our own newsletter. The AIM subscription and MAUG dues together would amount to $7.20 per user, per year. Make sure you either attend that meeting, or let me know if you want to participate.

The next meeting of the Mid-Ohio Atari User's Group will be on Saturday, October 14th, from 7:00pm until 9:00pm. The location is the same, being at A&B Computers, 1619 West Fourth Street, Mansfield OH 44906.

We are still in need of people to demonstrate new and interesting programs, so if you have something, please bring it along. Last month we had several program demos for the ST, but the 8bit was lacking any demos.

This coming month, I will be demonstrating Turbo-Calc for the 8-bit. This program is the first commercially available program which will run either with a stock Atari XL/XE, or a system which has been upgraded with the Turbo-816. It will use either Standard or Expanded memory.

Also, I will be presenting the shareware spreadsheet for the ST, OPUS. This is a very nice spreadsheet, which is especially nice if you have a monochrome system. Has full GEM and mouse support. Copies will be made available, and I am sure you all will agree it is a winner. Remember to support shareware programmers!! Well that's all for now, see ya in October!

Chuck

ROCKFORD ATARI COMPUTER CLUB

Serving the Greater Blackhawk Area of Northern Illinois

Rockford Atari Computer Club serves the North Central and Northwest area of Illinois. We invite anyone in the area to attend our meetings. We meet at Rock Valley College, Rockford, IL; usually on the third Saturday of each month. Meetings atart at 10 AM and feature demos on both the Atari 8bit and ST. Our next meeting is the FOURTH Saturday, October 28, due to a college scheduling problem.

Our Address is RACC, 2379 Circle Dr., Belvidere, IL 61008.

Terry Frits	President/ST VP	(815) 547-7718
Thom Lofthouse	8bit VP	654-1683
Dave Solmierski	8bit Librarian	654-0247
Andy Learner	Treasurer/BBS SysOp	397-5316
Terry Frits	Editor	547-7718
Thelma Schafer	ST Librarian	633-1259
RACC BBS		397-5327

We are looking for someone with an Express Pro BBS from the Michigan area to network with. Our BBS is Camille 2000 ((815) 973-5327.

The ST Club of El Paso is the only Atari ST and Mega user group in the El Paso area. Founded in 1988, The ST Club has distinguished itself as great help to those that are new to Atari computing as well as helping those that are old "hacks" at computing.

Meetings of the ST Club are held on the second Saturday of each month at the Richard Burges Branch Library, 9300 Diana. Meeting time is 12:30pm. Each meeting features demonstrations of the latest in software, and help for those that are having problems with particular programs.

Membership in the ST Club of El Paso includes the following benefits: A one year subscription to Atari Interface Magazine, discounts on computer supplies and software at Jenkins' Computer Store, discounts on services at local merchants, access to a huge PD file area, access to the ST Club area on STEP BBS, technical assistance, regular club auctions and social events. Voting membership is only $20 a year! (A great deal, when you consider that a subscription to AIM alone is $18!) Sponsored memberships are $15 a year, and newsletter only memberships are also $15.

To become a member of the ST Club of El Paso, call 915-821-2048, or write to: The ST Club of El Paso 10953 Yogi Berra El Paso, Tx 79934.

President:	Tim Holt	(915) 821-2048
Vice President:	Morris Miller	594-1906
Sec't/Tres:	Joann Anderson	751-2710
Editor:	Paul Stampfli	821-4861
Librarian:	Norm Bates	593-6234

From The Prez...

I apologize for not making it to the last meeting until the very end. Thanks to Morris, Paul, Dave and everyone else for making things work.

If you missed the last meeting, ARCSHELL 2.00 was demonstrated, and we had the drawing for the $50 gift certificate. Paul Stampfli won the gift certificate. (We more than paid for the cost of the certificate, so look for more raffles in the future!) Kevin Spetter won Optical Race by Tangerine Dream. That album was composed entirely on the ST, and even says so on the cover. Kevin says it is a great album.

We gained four new members: James Blount (who has been coming to the meetings for a year and finally was convinced we are here to stay.), James Foote, Mark Munnings, and Joseph DiVito. Several members renewed for the next year. Thank you to all for showing support in our club.

Norm Bates, our librarian, gave out free library disks to all members at the meeting. You have to come to the meeting in order to get your disk. Tom Hodgson came over from Jenkins' and showed off the Portfolio handheld computer. It was nifty. Now all we need is a handheld ST... did you hear that SAM?

I want to mention we now have a SECOND monthly meeting, due to our incredible growth. It will be on the last Thursday of the month at Richard Burges Library. This is an evening meeting and will run from 7 to 8pm. We had to do this, because we are getting SO BIG! That is a great statement to make. I am proud to be president of such a viable club. The second meeting will be informal, with no scheduled demos and club business.

Some upcoming meetings: October: Phasar will be shown off by Morris Miller. November: Combining ST animations AND live action demo by Terry Hughes a local ST user and artist. December: PC Ditto II (we hope) by Paul Stampfli AND AUCTION! January: Spectre GCR Mac emulator demo by Tim Holt. February: Word Processing on the ST

As you can see, we are busy! Thanks again for making us the best darn User Group in El Paso! Until next month,Tim

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at Route 5, Box 539, Blanchard, OK 73010 or at the TACE BBS (405) 755-9561, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Corrrespondence - $15.00.

President	Michael Beard	(405) 793-7978
Vice President	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Greg Yelle	(405) 390-9184
BBS SysOp	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649

Secretary/Treasurer Report — September

Well, first of all....Hello! How are you all doing? We had a great time at this month's meeting...tell your friends about us and bring them along too.

There, now that is out of the way, I can tell all of you what happened at this month's meeting. The Treasurer report was given...we have a grand total of $4.65 (plus a little that I have yet to deposit). We now owe Puget Sound Atari News around $46 which will be payed off soon.

Special Note — Chuck Leazott was here. He is a sales representative for ICD and Orion Microsystems. He moved in just this month. He can be reached at 405-732-9993 (voice) 405-732-9995 (modem). He sold many leftovers from ICD's booth at the Dallas World of Atari show at a greatly reduced price (under retail). He even had an MIO (which ICD will still make under special order). If you wish to order, he will take orders and sell them to you for under retail prices (minimum order $50, or plus $3 if under $50).

Also a short video of the WOA show was given. Mr. Leazott will be giving a demonstration of the Express cartridge at the next meeting. So come one, come all. Bring you friends. Bring you neighbors. Until next time.

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the last Saturday before the 18th of the month, at 2pm at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township. Upcoming meetings are September 16th, and October 14th, 1989. Officers:

President	Steve Volker	(517) 793-2955
ST Librarian	LeRoy Valley	686-6796
Treasurer/Sec'y	Marty Schmidt	792-6029
8 Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's PD library, along with a year's subscription to the Atari Interface Magazine. Check your mailing label, if you need to renew,(or haven't joined us yet!), DO IT NOW!

Beware!! There is a new Virus in town !! LeRoy Valley found it on some of the club disks and gave the warning. The new version of Virus Killer DOES identify and eliminate this one.

The meeting of Participating Users Groups at the headquarters of Atari Interface Magazine was held. The minutes of that meeting were presented by Steve, and here are some highlights.

There are now two distinct classes of clubs involved with AIM; participating clubs (us), and affiliated clubs. AIM is now only $.50 an issue for Participating clubs and $1.25 for Affiliated. The more a club participates in the content and formulation of the newsletter, the more representation they have.

There was also a proposal brought up at the meeting involving a monthly disk of PD software. Bill Rayl suggested that AIM might fill a disk each month with downloaded software from different sources and make it available to the clubs for a nominal $1 per disk cost. If this was agreeable, then AIM will begin to send them automatically.

What You Missed — Though he broke an unspoken taboo by running it on a color TV instead of a color monitor, Steve Volker gave a show of the mystic intrincities of Shadowgate. Though the game is essentially another hack and slash adventure, it has a few attractive traits. (We won't mention why the demo was cut short, but those of you who were there know,..)

What You Shouldn't Miss — In October we are expecting Brant LeFreniere's demo of Touch Up and Migraph's new hand scanner. This is one of the most looked for demos, so show up!

The November meeting will have something special, with a FACE OFF between the abilities of WordPerfect 4.1 and the lastest version of 1st Word Plus. Leroy Valley challenged Marty Schmidt to 'prove' his wordprocessor was better, and it's up to us to decide! BE THERE!! (..or be square?..)

Look for a demo of Fast Technologies new 16 mhz upgrade board soon, and see CMI's version, with a socket for the BLITTER chip, in person! (And For Sale?) The 8bit section is on hold temporarily, until some 8bitters,besides Ted Beauchamp, decide to SHOW UP!

We are compiling a list of volunteers for the next Consumer's Market show at Fashion Square Mall. So far we have five, one who is bringing a camera! COME JOIN US!!

Equipment Volunteers for October:
Bryant LeFreniere -ST System w/ Scanner
Leroy Valley -Desk Jet Plus, Muti-Sync Monitor

Remember, if your bringing equipment, please bring all necessary cables, (i.e. power cords, monitor cables, mouse, or whatever.)

Washtenaw Atari Users Group Meeting: 9/12/89

The September meeting of WAUG was held in the Wolverine Room of the Michigan Union. Craig Harvey called the meeting to order at 7:45pm and introduced Bill and Pattie Rayl.

Bill described some of the avenues they are pursuing in the publication of Atari Interface Magazine and predictions on how the "participating clubs" would be affected. The enthusiasm amongst the members clearly showed support for the new plans.

Craig announced there was little hope of seeing either the Spectre GCR or PC Ditto II before the October 10th Emulator Meeting, and explained the officers decided on Graphics and Animation instead. November 14th will feature DeskTop Publishing, December 12th will naturally be dedicated to Games and the Christmas Party, while January 9th will likely feature Telecommunications in the grand WAUG tradition.

Craig said the next meeting will be in the Anderson Room at the Union. As always, meetings start at 7:30pm with the doors opening at 7. Craig presented member Jim Shillington with an Appreciation Award for his contributions to the 8bit disk library, which now exceeds 250 disk selections! Many thanx Jim!

Enhance your publishing power.

Migraph Hand Scanner.

Add scanned graphics to all your projects quickly and easily with the Migraph Hand Scanner.

The Hand Scanner provides a scanning window over 4″ wide with four scanning resolutions: 100, 200, and true 300 and 400 dots per inch. It also offers adjustable contrast, three dither settings for scanning halftones, and a special setting for line art.

Build your own library of images. Logos, photographs, books, illustrations . . . provide you with an unlimited supply of art.

Touch-Up,™ Migraph's high resolution image editor, lets you scan *and* edit your images. Powerful editing tools include crop, invert, resize, flip, cut and paste, multiple zoom levels, a full array of paint tools, and much more.

When your images are "pixel perfect", import them into your favorite ST publishing programs like Calamus, Fleet Street, PageStream, and Publisher ST. In addition, several save formats let you use your images on the PC and Mac.

The Migraph Hand Scanner and Touch-Up. Powerful tools for professional publishing.

For all Atari ST and Mega systems with monochrome or color monitors, 1MB memory and 3.5″ DS disk drive.

See your dealer today for more details or call us direct. Dealer inquiries invited.

© 1989 JN

1989 Antic Award Winner

The Grahics Image Scanner for the Atari 8-bits! Now, Easy Scan II is even better! Supports graphics modes 8, 9, 10, 11, and 15. Saves images in the standard 62 sector format. Excellent for; User Groups, clubs, churches, and others! Use with; Banners, flyers, posters, and more! Requires – XL/XE/XE-GS with 128K (or more) and Epson graphics capable printer. ***Only*: $99.95**

Print Shop Drivers

Now you use your "incompatible" printer, with Print Shop and Print Shop Companion! Does NOT modify your original disks! ***Only*: $14.95 each**, for your choice of the following printers; Atari 1020 Printer/Plotter (in 1 of 4 colors!), Okimate 10 (black only), Epson LQ-500/800 (24-pin compatibles)

Memory Upgrades

Memory Upgrades are NOW affordable again! All kits below INCLUDE RAMs and software! 128K & 192K upgrades are 100%-130XE Compatible. 256K and higher upgrades INCLUDE our Ramdrive Utility Package!

Computer	*Product Name*	*Description*	*Price*
600XL	Ramdrive + 64K	(16K to 64K)	$29.95
800XL	Ramdrive + XL to XE	(64K to 128K)	$49.95
800XL	Ramdrive + XL	(64K to 256K)	$79.95
65XE	Ramdrive + 128K	(64K to 128K)	$39.95
65XE	Ramdrive + 320K	(64K to 320K)	$79.95
130XE	Ramdrive + 192K	(128K to 192K)	$39.95
130XE	Ramdrive + XE	(128K to 320K)	$69.95
130XE	Ramdrive + 576K	(320K to 576K)	$69.95
XE-GS	Ramdrive + XE-GM1	(64K to 128K)	$49.95
XE-GS	Ramdrive + XE-GM2	(128K to 192K)	$39.95

XF35 Kit

Now, XF551 owners can convert their drive to the newer 3.5" format, and have a MASSIVE 720K of storage! Works with MYDOS, SpartaDOS, and the SpartaDOS X cartridge. Excellent for; BBS use, Hard Drive backup, or use as a "mini hard drive!". Includes Upgrade ROM, adapting cables and complete instructions. (3.5" drive and cage not included) ***SALE Price*: $29.95**

Happy Doubler

Happy 1050 owners can now program their drives to be fully compatible with ICD's U.S. Doubler, including formatting disks in the U.S. skew! Also allows you to re-program the drive numbers up to D8! Completelty software based, only 1 needed for as many Happy 1050s as you you may have! Also includes FREE Happy and Doubler type utilities! ***Only*: $19.95**

Imitator Controller

Happy 1050 owners can now go from the Fast or Slow modes, with the flick of a switch! Has another switch for write-protect, meaning "no more disks to notch!" Also has a two-color LED for monitoring the write-protect status. Easy to install, NO soldering required! ***Only*: $39.95**

IC1050 Controller

For ALL 1050 drives – Similar to our Imitator Controller, except without fast/slow switch. ***Only* $29.95**

SIO Port Box

Has 4 SIO ports to solve the weak signal problems, by allowing you to plug mutliple peripherals in one box. Also solves the "dead end" peripherals, like the 410, XM301, and most printer interfaces. NO power required. ***Only*: $39.95**

SIO Switch Box

Allows you to control 2 computers with one peripheral setup, OR, 1 computer with 2 peripheral setups! Has 3 SIO ports and a switch for; 2-in and 1-out OR 1-in and 2-out. Also solves the problem of using 2 devices that draw their power from the computer. (like the XM301 Modem, P:R Connection, and most printer interfaces). NO power required. . ***Only*: $49.95**

ICX-85 Keypad

Finally, a numeric keypad for the 8-bits, that does NOT require the use of handlers! Works with ALL your software! Excellent for; programmers, spreadsheets, data base, and more! Deluxe version (for XL/XE/XE-GS) has the 1200XL Function Keys (F1-F4) also.
ICX-85 Kit (requires Hong Kong made CX-85) – **$29.95**
CX-85 Keypad – **$49.95**; Deluxe CX-85 Keypad – **$69.95**

Modem Mouth

A small device that allows modems that do NOT have an internal speaker (like the 1030 and Avatex) to "hear" what is going on! (busy signals, disconnects, recordings, etc.) Also works as a phone line monitor. Easy to use, just plugs in. ***Only*: $29.95**

Xformer Cable

Now, along with the Xformer Software (available separately from Darek Mihocka), you can run many Atari 8-bit programs on your ST or Mega! Allows you to plug an 8-bit disk drive or printer into the ST or Mega! Also works for tranferring text and AMS music files as well. ***Only*: $19.95**

Ordering Information

USA – Add $3.50 for S&H. COD is available for $3.00 extra. APO/FPO – Include $3.50 for S&H, in U.S. funds. Canada/Mexico Include $7.00 for S&H, in U.S. funds. Other Countries Include $10 for S&H, in U.S. funds.

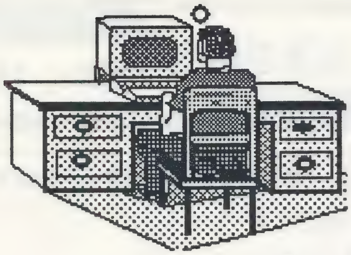
AIM is produced on a 2.5 Meg Atari ST, HP LaserJet II, Timeworks DTP and PageStream.

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS. A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable). Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of AIM or any participating club. Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp.



Editorial Ramblings

This is a sad story, but one that needs to be told. Anyone who has recently purchased TOS 1.4 or is thinking about buying the new ROMs, pay close attention. Although this incident occurred in Michigan, it may well be happening elsewhere.

Shortly after hearing from Atari that TOS 1.4 was available to dealers, we contacted a local dealer (who shall remain nameless) to get our two STs upgraded. We were told it would take a few days to get the TOS 1.4 chips in, but we could get them for only $99 installed. Since that was Atari's "suggested retail" for the chips alone, it sounded like a good deal. We got them installed within the week and went home quite happy.

Nearly a month passed. Everything was working fine until we got a copy of DC Utilities and a couple of the programs in the package simply wouldn't work for us. In contacting Michael Vederman of Double Click, he informed us that we had a BETA version of the developer's TOS 1.4 in our machines! In disbelief, we called Atari and found that the public release of TOS 1.4 has a default system date of April 16 (4-16-89). Ours had a date of February 22. They were indeed illegal PIRATED copies of the developer BETA ROMs!

We contacted the store we purchased the ROMs from and were then told that they indeed did not come from Atari but were supplied "by a local distributor." The store owner was unwilling to tell us who this distributor was. We began contacting other stores in the area, and we found two more stores willing to admit they were selling TOS 1.4 chips that had not come directly from Atari. These stores both were more than happy to tell us where they got those chips.

It seems that Innovative Concepts of Warren, MI has been burning illegal versions of TOS 1.4 into EPROMs and selling them to local stores. These stores, whether knowingly or not, have been selling pirated TOS 1.4 to their customers. We attempted to contact Innovative Concepts for comment, but they were unavailable and did not return our call.

At this time, we do not know how many of these pirated copies of TOS 1.4 have been sold/installed by the Detroit area stores. If you have purchased TOS 1.4 recently (no matter where you are!), please boot your system with no clock installed and check the system default date (use CONTROL.ACC, for example). If the date is anything but 4-16-89, you probably have an illegal copy of TOS 1.4. To make matters worse, some pre-release versions of TOS 1.4 have NASTY bugs in them. The worst one reportedly can blow away all files on your hard drive under certain circumstances.

If you were sold a copy of TOS 1.4 that is other than the 4-16-89 release, contact your local dealer and request that he replace the illegal chips with a legal version of the ROMs DIRECT from Atari...or get your money back.

If you're planning to buy TOS 1.4 in the near future, make sure you specifically ask if the chips are direct from Atari. According to John Townsend of Atari, official TOS 1.4 ROMs are only available directly from Atari to the dealers. If your dealer tells you otherwise, he's lying. Also, ask to see the chips before they are installed...legal versions have labels with the 4-16-89 date and the word "Rainbow" printed on them.

We hope that ST/Mega dealers everywhere have the good sense not to try to cheat your customers by selling them illegal versions of TOS 1.4. We urge dealers who have done this in the past to stop, apologize to all purchasers of the illegal chips and offer to replace those chips free of charge.

We also hope that Innovative Concepts has the good sense to quit making illegal copies of the TOS ROMs.

Regardless of what happens in the future, Atari has been fully informed of the whole situation. Where it goes from here is in their hands.

Bill and Pattie Rayl

For 520ST, 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, PC-emulators, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

expandable boards:

520A	Socketed, no RAM	$129.
520B	1 MB, socketed	$179.
520C	2.5 MB, socketed	$395.
520D	4MB	$545.

non-expandable boards:

520-2	Socketed, no RAM	$79.
520-1	upgrades to 1 MB	$149.

Upgrade your 1040ST or 520STfm just as easily!

Send us your 520STfm and we will upgrade it to ONE Megabyte by installing a second bank of memory, easily removable in case you want to upgrade again. Complete with installation for only $149 plus shipping.

Or install one of our 1040 (fits 520STfm too) memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes. There are nowadays four (4) different versions of the 1040/520 motherboards around. If you bought your ST less than 2 years ago, you need to check your machine, detailed info in our catalog.

Version "0" fits all 'old style" 1040/520 with 6 ROM chips under the power supply. Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

1040A	1 Bank sockets, no RAM	$110.
1040B	Fully socketed, no RAM	$149.
1040C	2.5 MB + 1 bank sockets	$365
1040D	4 MB, 32 1 Mb DRAM installed	$565.

Version "1" fits all 1040/520 with the memory chips under the power supply. Available room prohibited the use of "DIP" packaged chips. The main board is only 6.4" x 2.9" and needs "ZIP" packaged 1 Mb x 1 DRAM. It fits in the area under the power supply with the shield installed and stays 0.5" away from the CPU to allow attachment of other upgrades. More details in our catalog!

1040A1	no sockets, no RAM	$110.
1040B1A	1 bank socketed, no RAM	$149.
1040B1	completely socketed, no RAM	$189.
1040C1	2.5 MB, no sockets	$334.
1040C1A	2 MB installed, 2nd bank socketed	$365.00
1040D1	4 MB installed	$495.

Upgrades for version "2" of the 1040/520 motherboard should be available in a month!

All upgrades can be equipped with a Clock Option on the Memory Board, comes with software, only $30.

Stand-alone CLOCK, please specify 520/1040 and your version of the motherboard $38.

EXPANDABLE Hard Drive Kits

come complete with software and all parts needed to get the system operational, 1 year ltd. warranty. There are right now three different case styles available:

1. Tower Type, 10" wide x 6.8" high x 15" deep, if sitting on your desk with monitor on top , with full SCSI interface and 'DMA-through'

-150 W PC power supply w/fan

-room for up to 5 half height hard drives or combination full/half height

-mounts on floor, under desk or on desktop

-can power up 520ST and external floppy drives.

-optional delay circuit for CPU allows fully automatic power-up!

T0S	No Drive, install your own emb. SCSI drive	$265.
T0	No Drive, MFM controller	$299.
T0R	No Drive, RLL controller	$475.

Complete with drive mechanism:

10 MB	$485.	20 MB	$565.	30 MB	$695.
40 MB	$745	64 MB	$795	85 MB	$895.

2. Monitor Style, 13.25" wide (same as MEGA) x 15" deep x 3.8" high with single port host adapter

-ready for up to three 1/2 ht or 1 each full/half ht. hard/tape/floppy drives

-55 W power supply with 115V fan

-can be placed under monitor or at side of your desk

M0S	No Drive, install your own emb. SCSI drive	$179.
M0	No Drive, MFM controller	$295.
M0R	No Drive, RLL controller	$365.

Complete with drive mechanism:

10 MB	$395.	20 MB	$495.	30 MB	$545.
40 MB	$685.	49 MB	*$625.	64 MB	$795.
85 MB	*$795.				

3. Desktop Style, 4.5" wide x 6" high x 13" deep with single port host adapter

-ready for 2 1/2 height or 1 full height drive

-55 W power supply

-optional fan available (add $18)

D0S	No Drive, install your own emb. SCSI drive	$149.
D0	No Drive, MFM controller	$279.
D0R	No Drive, RLL controller	$349.

10 MB	$355.	20 MB	$475.	30 MB	$525.
40 MB	$695	49 MB	*$595.	64 MB	$725.
85 MB	*$745.				

ATARI MEGAFILE:

Replace the 20 MB drive in your MEGAFILE 20 with a 42 MB 40 ms autoparking drive. Comes with a 1 year warranty on the drive mechanism. Exchange price including installation with your drive in good condition: $260., $369. outright.

Gain 65 MB of high speed (22ms av., 5 ms track to track) storage. Exchange with installation: $360., outright $449.

SUPRA 20/30 and ASTRA 20 MB:

Upgrade to 49 MB high speed storage with auto parking, 500 K/s transfer rate. With installation and transfer of your existing files: $379.

Host adapter cards are separately available and come with software and DMA cable or additionally with case and 6' round shielded SCSI cable with embedded power supply lines. Prices after the "/" are for version with case and cable. 1 port $79/119 full SCSI $119/159

CPU CASES:

Upgrade 520/1040 to the MEGA standard.

* Separate CPU and keyboard, gain space for three each 3.5"/5.25" floppy, hard or tape drives in two separate drive bays. Full height drives will also fit.

* A 150 W power supply with fan provides power for all possible combinations and keeps everything cool

* Reset button on keyboard

* A delay circuit allows fully automatic HD power-up.

* Monitor can be switched on/off with CPU, using an optional cable.

* Our kit uses a steel case 18" wide x 12" deep x 8" high, easily strong enough to support a high resolution monitor.

* The original keyboard gets a low profile enclosure, 18.7" wide x 7" deep x 2" high, consisting of a metal bottom part and the modified plastic top of the original case, supplied as exchange or you do the modification your self. The kit comes preassembled and installs without soldering. All mounting kits, wire harnesses and connectors to modify a standard machine are included.

Complete kit, please specify your machine type $295

OPTIONS:

Hard Drive kits for the CPU case consist of host adapter/controller with support bracket if necessary, DC harness and control cabling and might also be used with customer supplied case/power supplies. Kits with controller cards come with connections to two 5.25" drives. Kits for embedded SCSI drives come with one SCSI connector. Additional connectors $8. installed.

C0S	No Drive, install your own emb. SCSI drive	$99.
C0	No Drive, MFM controller	
C0R	No Drive, RLL controller	$299.

20 MB	$415.	30 MB	$465.	40 MB	$595.
49 MB	*$525.	64 MB	$725.	85 MB	*$685.

Cable sets to connect additional 3.5"/5.25" floppies also available, please see catalog.

KEYBOARD KITS:

We noticed quite a lot of interest for our keyboard parts used in the CPU CASE. Keyboard kits consisting of metal bottom case, connecting cable with reset and modified plastic tops on an exchange basis are available separately for $69., please specify your machine type.

Space limitations don't allow a more detailed descriptions. For complete 20 page catalog contact:

tech-specialities Co.
909 Crosstimbers
Houston, TX 77022
(713)691-4527/8
FAX: (713)691-7009

We ship COD ($3) or prepaid (5% discount), sorry no credit cards!
Add the following amounts for shipping and handling:

memory upgrades and host adapters, 1st unit $5, add. units	$2
Hard Drive kits/CPU cases without drive	$10/$20
with drive - special shock resistant packaging needed	$20/30

Texas residents and willcall customers add 8% state sales tax.

Above prices are correct on 10-20-89. Prices with a "*" are PREPAY SPECIALS, no further discount available.

Atari Bulletin Board

by Bill and Pattie Rayl

Atari Corp. News

Sig Hartmann has finally validated rumors of his leaving Atari. He announced his retirement from Atari effective Nov. 1st of this year. Sig had been denying rumors of his pending retirement since it was first announced in the online publication "ST Report" some months ago. No official word has come from Atari about who will take over Sig's responsibilities.

Atari has named a new president of Atari Computer Division, Mike Moran. Bill Crouch has also been named to replace Mike Dendo, who recently vacated the position of Vice President of Sales.

Portfolio News

Interfaces for the Portfolio have been shipped, so you can now purchase the necessary cable/interface to connect a Portfolio to an IBM compatible. Although no figures were available at press time, Atari has stated sales of the Portfolio are very good.

Atari recently placed a 2-page, full color ad for the Portfolio in the "American Way" in-flight magazine for American Airlines. The title on the ad was "Put a Rocket In Your Pocket," showing off Atari's latest "palm-top" computer.

Bob Brodie Visits St. Louis

User Group Coordinator Bob Brodie is scheduled to travel to St. Louis at the beginning of this month to attend a multi-brand computer show hosted by McDonnell Douglas. He plans on speaking to the Atari clubs in the area at the same time.

On-line News

The Atari Revolution has been making a stir recently. The Atari Revolution is a user-based marketing scheme to promote the Atari line of computers. Developed by Donald Thomas, Jr. of Artisan Software, "The Handbook for the Revolution" contains a 1990 "Calendar of Events" including a week of "Call Sam Tramiel," a "Mailing" week where you stamp all your letters with "Join the Revolution, buy an Atari Computer" and "Call the President" day where you call President Bush and wish him a "Revolutionary day." At the recent WAACE AtariFest, Atari User Group Coordinator Bob Brodie said Atari has reviewed the proposal and they support this grass-roots revolution in Atari computing.

The AAD

Out of the WAACE show also came the newly-formed Atari Association of Developers. This is an organization of Atari developers banding together to help each other and to improve relations between Atari Corp and its many software and hardware developers. A special area on GEnie is set aside for the AAD. For more information on this organization, please see the article elsewhere in this issue.

Fast Technology vs. PC Speed

The Turbo16 16mHz board for the Atari ST from Fast Technology is receiving rave reviews from on-line owners. Jim Allen, vice president of Fast Technology, also had some harsh words for MichTron and their new German-import IBM emulator, PC Speed. More specifics are available on GEnie, but Jim criticized MichTron for marketing a "hardware hack" in the niche market of another Atari developer, namely Avant Garde.

Blitz

Another hardware project (this one public domain) has appeared on-line. Blitz is a software/hardware disk duplicator costing about $20 in easy-to-get hardware parts. Blitz is also called "The Happy Killer" because it will back-up copy-protected disks at a fraction of the cost of a Discovery Cartridge.

Writer Dies in Quake

There was a bit of sad news posted on CompuServe concerning the death of John Anderson, a long-time contributor/editor to such publications as Creative Computing, Atari Explorer and Computer Shopper. John was killed during the San Francisco earthquake. Most recently, John was employed as a senior editor of MacUser magazine. He leaves behind a wife and two children.

Released Products

Gadgets by Small has started shipping the Spectre GCR cartridge. According to Dave Small, they are back-ordered about a month. If you sent in for your GCR, you may have a short wait before you get your cartridge, depending on where you are in the "queue." Gadgets by Small, (303) 791-6098.

CodeHead Software has announced a major update to Hotwire (now at version

1.4). This "GEM-based shell" now features a "Ledger" function that keeps track of the time you spend in each program, a resident corner clock that can be turned on or off for each program you run, the ability to set an individual password for each program you use, direct access to desk accessories via MultiDesk and CodeHead's new MaxiFile (read on!).

Along with this new version comes a major update of MultiFile (which comes as part of the CodeHead Utilities reviewed elsewhere in this issue). Now called MaxiFile, the program allows you access to any disk/file operations you could possibly want, including disk formatting and all the features found in MultiFile. Additional features include the ability to enter up to three lines of description for each file (similar to the Macintosh Finder's "Show Info" function) and selection of multiple templates to show files with several different extensions at one time.

Hotwire and MaxiFile have been bundled together as Hotwire Plus and is available for $49.95. MaxiFile may be purchased separately for $24.95. Current owners of Hotwire can upgrade to Hotwire 1.4 for $5 plus their original disk or can purchase both Hotwire 1.4 and MaxiFile for only $15. Current owners of CodeHead Utilities can purchase MaxiFile for only $15. If you're confused by all these prices or want more information, call the CodeHeads at (213) 386-5735.

Practical Solutions has announced they are shipping their cordless mouse. This tail-less mouse retails for $129.95, but Practical Solutions says many User Groups have taken them up on their offer to register to receive all Practical Solution products for only $25 because of the new cordless mouse. For more information, call (602) 322-6100.

New ST Games

Several games have been released for the ST in the last month. Broderbund has released the ST version of the very popular Shufflepuck Cafe. This game has been available for some time on other computers and has finally appeared on the ST. Shufflepuck is a form of fast air hockey played against a variety of opponents.

Electronic Arts has released F/16 Combat Pilot and PowerDrome. F/16 Combat Pilot is the first fighter simulation game to include squadron strategy, with your choice of flying as combat pilot or squadron leader. PowerDrome is a car race set in the 25th century, and your car has wings too!

With the revival of old comic book heros recently, IntraCorp has released Superman: the Man of Steel. You (as Superman) have to defeat your two arch-enemies Darkseld and Lex Luthor who have joined up against you...and in your spare time, you can save the Governor's party when his yacht (complete with Lois Lane) is hijacked.

Computer Shows

The WAACE show last month was, from all accounts, very successful. Approximately 3,000 people attended from a number of states around the VA/MD area. For more information on the show, please see the related article later in this issue.

NEO-STAG, the NorthEast Ohio ST Atari Group, is sponsoring a one-day show featuring the ST and Mega on December 2. The show is held in conjunction with the Girard Free Library at 105 E. Prospect in Girard, Ohio from noon until 4 p.m. Admission is free. For more information, contact Chet Walters at (216) 539-6033.

Any club sponsoring a computer show may wish to contact us with their information, and we'll be sure to include it here. Plus, we offer to run a half-page or smaller advertisment for the show free of charge!

The ToadFile 44

The first LOW PRICED Removable Cartridge Hard Disk Drive!

We at Toad Computers wonder why good technology always has to mean high prices and long waits. We have the Toadfile 44 **now**, available in varying configurations with fixed drives up to 129 megabytes, while other companies are still telling you to wait. We also have **the lowest price** available. We use the same drive Atari™ will be using in their drive, and compatible cartridges will be available at your Atari™ dealer, or through us. Finally, the capacity of a hard disk with the convenience of a floppy. Only from the leaders! Toad Computers.

ToadFile 44 - ONLY $899!

Basic unit includes drive, one 44 megabyte cartridge, case, power supply, fan, ICD™ host adapter, clock, formatting and partitioning software, and a 3' DMA cable. Please specify an under-the-monitor case or a shoebox style case. Both may hold two 5.25" or 3.5" drives. Extra 44 MB cartridges are $99 when purchased with drive, or $109 later.

ToadFile 44 *Variations*

ToadFile 94 *(44 MB Cartridge + 50 MB Drive 40ms time)*	$1279
ToadFile 109 *(44 MB Cartridge + 65 MB Drive 40ms time)*	$1309
ToadFile 129X *(44 MB Cartridge + 85 MB Drive 28 ms time)*	$1399
ToadFile 88X *(2 44 MB Cartridge Drives & Carts, 25 ms time)*	$1549
ToadFile 44S *(44 MB Cartridge Drive, Case, Power & SCSI In)*	$799
ToadFile 44D *(44 MB Cartridge Drive Only, No Power or Case)*	$699

Toad *Hard Disk Drives*

Toad 30 *Drive 40 ms Access Time 3.5" Mechanism*	$539
Toad 50 *Drive 40 ms Access Time 3.5" Mechanism*	$599
Toad 85 *Drive 28 ms Access Time 5.25" Mechanism*	$709
Toad 100 *Drive 40 ms Access Time 2 3.5" Mechanisms*	$899
Toad 170 *Drive 28 ms Access Time 2 5.25" Mechanisms*	$1399

The Right Brain

by Paul Stampfli (El Paso)

Well, here we are in sunny, beautiful El Paso, Texas. Home of the brown Christmas and the hot taco. Home of dirt, dust, drug smuggling and dancing senoritas. Home of some of the "hottest duck hunters" (Army Air Defense Artillery) in the world and about half a million souls just trying to make it through their lives, raise their young, and have a place for themselves to grow old.

It could be any town anywhere in America with very few changes. But it's the home of the El Paso ST Club, or is that the ST Club of El Paso? You know, I never really found out, and I'm not sure that I care, nor if it even matters.

Reading MacWorld

I've been reading again. (Now for those of you that don't know, every reader of this magazine in El Paso county just said a bad word and turned the page. You Midwest types may continue now.)

I read the September 1989 issue of MacWorld. Although I still don't have any reasonable idea how their machine works, nor why it's going for two to three times what ours is, I see that they have the same problems that we do.

Deborah Branscum wrote an article that especially hit home with me. It's called THE GOOD FIGHT, and if she's reading this, "Thank you!" She speaks of the Boston Computer Society whose Mac only group is 12,400 members. No, that's not a typo, *Twelve Thousand and Four Hundred* members. The New York group NYMUG is 1500 members and the Berkeley, California group (BMUG) has 8000. Makes me feel like very small potatoes, I'll tell you that for sure! (Last time I checked we had, oh, maybe fourty members, of which maybe thirty are active and maybe three to five really work at making the club go.)

Gargantuan Clubs

I was thinking, while I was reading this, about all the things that our group could do with a thousand users. What a THOUGHT! We could use the money to buy club-owned hardware so the same three or four people wouldn't have to keep lugging their systems in twice a month.

We could probably invest in a lot of advertising, manuals, tech support stuff, and maybe even have someone part-time to answer a club phone and put together information for us. Wouldn't that be neat! Our work and play would become so much easier. Wouldn't it? Or would it?...

Let's see, $20 per member times 1000 members, that's $20,000 a year to use for the club. That would sure make things reachable. But where should we meet? The civic center? The coliseum?

Is Bigger Better?

How many STs would we have to bring in so that everyone could see what was being demonstrated? How would we EVER link them all together so that the same thing happened at the same time? Who would give those demos? The last few times I've tried to demo something, I felt like I had been in a street fight afterwards.

How could you EVER answer the questions of 1000 people at one meeting? Would the club president know ALL the members by sight? Could we still offer door prizes and drawings and things? Would we all be able, still, to laugh at each other's mistakes and learn from them? I doubt it.

Entertain Me Syndrome

I don't know about the other big groups, but the big Mac groups appear to be suffering from the good "new" American axiom of "You owe it to me; give it to me!" that is pervading so much of our society. Groups have technical support hotlines, paid employees and corporate members and sponsors. How can you really KNOW the people in an organization that large? Sounds like a business in itself to me.

No, I like our little group. I wish that we had more support, more membership. I wish that we had more members who would *contribute* their time and efforts the way that Tim, Morris, Norm and a few others have. Those few can't keep carrying the flag for all the individuals in our group forever.

But for now, our little club is doing just fine. We are learning, and growing and making friends along the way. Kinda sounds like life, doesn't it?

[Editors' Note: Paul, there are still many members and past officers of MACE who remember the "hey day" of the Atari Clubs, who remember when MACE's annual membership was around 2,000 families and who remember filling a large section of the Southfield Civic Center. They most likely have a different perspecive on the "giant club" situation you've touched on. Their views are most welcome.]

Turbo-Info # 5

New 65c816 Instructions

by Chuck Steinman (DataQue)

This is the fifth installment of a multi-part information article on the Turbo-816 from DataQue Software, for the Atari XL/XE computers. The previous installments went over the basic system, memory, and OS. This article will cover some of the new 65c816 instructions.

Emulation in the 65C816

The Turbo-816 can operate in either its native mode, or the 6502 emulation mode. While in the emulation mode, the processor has many of the same limitations as the 6502. Even while in the emulation mode, many new instructions are available.

Some are of little use, because of being limited to the 64K addressing range of the 6502. Many of the new instructions allow for smaller, faster code. Other instructions offer power which was previously not feasable or practical.

PEA, PEI&PER Instructions

Of particular use are the PEA, PEI, and PER instructions. These allow the programmer to push data onto the stack, without using one of the normal registers. This is extremely useful where parameters are passed between subroutines.

The PEA instruction will push a word-sized value onto the stack. This is extremely handy for parameter passing, since you can pass absolute values or addresses.

You can also pre-load return addresses onto the stack, remembering of course that you must subtract a value of one from the destination address. PEA is also invaluable for setting the Data Bank, and Direct registers, without using a register.

The PEI instruction will push the contents of two consecutive direct page registers onto the stack. For example, PEI $22 will push the contents of direct page address $23 onto the stack, followed by the contents of direct page address $22. This is very useful for pushing the contents of pointers onto the stack.

The PER instruction will push a relative value onto the stack, which is the relative offset from the current program counter to the word operand. This can be used to generate relocatable subroutines.

Since the offset is pushed rather than the actual address, the location of the code will have no bearing on the resulting value (assuming that both routines are moved an equal amount). The value pushed is a signed word value.

Another pair of useful instructions are the INA, and DEA instructions. These instructions will increment or decrement the current value in the accumulator. It is nice where you just want to change the accumulator by a small amount, ignoring any carry. These can also be coded as INC A, and DEC A by many 65816 assemblers.

Branching Out

The 6502 has a nice set of branching instructions, except it overlooks the occasion where you would like to branch without any test. The reason for wanting to do this is to generate more relocatable code. The 65816 has two versions of branch always instructions. The BRA, which is like the other branch instructions in that it has a +127/-128 range. The BRL instruction will branch always to an address within a +32767/-32768 range. Both branches are limited to the current program bank.

A unique instruction of the 65816 is the COP instruction. This is an instruction for the (yet-to-be-seen) add-on math co-processor. But not only can it be used for that, but also users may add their own math "co-processor" (or other custom routine). The instruction has a required one byte parameter, which is not directly passed. Like the BRK instruction, the COP instruction generates an interrupt but does not push the operand onto the stack. The COP also has its own interrupt vector.

TRB and TSB Instructions

There are two new instructions for bit manipulations also. The TRB (test and reset bit) and TSB (test and set bit) instructions allow you to do a read-modify-write operation between the accumulator and either a direct memory or absolute memory address. I do not know why they did not allow for a long-absolute or indexed version, which would be useful. Any bits set in the accumulator when the instruction is executed, will clear (TRB) or set (TSB) bits in the specified destination address.

Since there are quite a few more registers in the 65816 than the 6502, there had to be an improvement made in stack handling. The 6502 only had two each of the push and pull instructions. You could push or pull the accumulator (PHA/PLA), and processor status register (PHP/PLP).

The 65816 adds to these instructions to push and pull both of the index registers (PHX/PHY/PLX/PLY), the direct register (PHD/PLD), the data bank register (PHB/PLB) and the program bank register (PHK). As you may notice, you can only push the data bank register, since popping it would be somewhat difficult to apply.

Extra 16Bit Addressing

Of course, with all of the added addressing capabilities of the 65816, there must be some way to directly call routines outside the base 64K of the machine. There is a JML instruction, which is available only as an indirect jump long. I also consider the JMP ABS_LONG a JML, but the manufacturer does not agree. There is also a JSL, which will call a long subroutine, available only in an absolute addressing mode. There also must be a way to return from one of these long subroutines, which is implemented in the RTL instruction.

A few odd instructions are STP, WAI, and WDM. The STP is used in applications (primarily battery-backed ones) where you need to put the processor into the low-power sleep mode. The only way to recover from this mode is to reset the processor. The WAI instruction is similar to the STA WSYNC that is used in the Atari. This instruction will halt the processor until an interrupt occurs. Unlike the WSYNC, the processor will wait for either an IRQ or NMI interrupt.

The WDM instruction has the most potential. This instruction is the gateway into the 32bit 65832 processor, which includes a math co-processor. After four years of waiting, this CPU has not yet been seen (sound familiar?).

XBA and XCE Instructions

The last two instructions I will cover are XBA and XCE. The XBA allows the programmer to access the upper byte of the accumulator while in either the NATive or EMUlation mode of the processor. It is also handy for a temporary holding place for the accumulator. The upper byte of the accumulator is swapped with the lower byte each time the instruction is executed.

The XCE exchanges the processor status carry flag with the emulation status bit. This is how you move to and from the native and emulation modes. If the carry is set before the instruction, the processor will be in the 6502 emulation mode.

On to Applications

Now that the basics of the Turbo-816 system have been covered, I feel that you are ready to see how a Turbo-Application is designed. I will be using primarily Turbo-Calc as a reference.

I will cover how you make determinations of what resources are available and how to implement dual-function routines, without sacrificing much speed and code size. Remember, if you have any feedback pertaining to the Turbo-816, feel free to write.

BEST ELECTRONICS

ST/Mega

First shown at the World of Atari show in Anaheim our **New ST/Mega Compatible Mouse $49.95**

The very **Best** mouse cleaning kit we have seen, it's so good it has an U.S. Patent on it!

"The 360 Cleaner" $16.95

Hard drive builders and Megafile 30 owners, check out our new low price on 3 ft molded hard drive cable male to male $15

6 ft ST **Monitor cable** male to male $19

Happy Discovery Cartridge Option 1 upgrade kit, clock, 3rd+4th drive circuitry $27

Right Angle ST 40 pin connector $4

ST/Mega CX22 **Trackball/mouse** $24

Back in stock! with 1987 pricing 6ft Disk drive cables $15 ea. 25" Disk drive cable $12

520ST Owners thinking about selling your computer to upgrade? Make that computer look like a new computer with a new 520ST case set. Reg $40 **Sale $29**

Mega Owners! Need a longer keyboard cable? Try our new cable that is 5"-7" longer in its coiled form. $12 ea.

Goldstar **ST Monitor** TH901 Thermistor $8

Xformer Cable The Xformer Cable allows Atari 8 bit peripherals to be used on ST/Mega systems and data transfer from 8 bit to ST. Xformer software and Documentation not included $19

Wico Joystick

by Rich Scheidel (CCCC)

Last year, I received a letter from Wico Corporation concerning the release of a new product, the new Wico Ergostick. I did a report on it at the time and will redo it for AIM. It really is good (the joystick, I'm not tooting my own horn!).

As you all know, the new Ergostick is a joy to behold as well as use. The first impact is visual. This joystick is molded to the contour of the hand, thus reducing hand fatigue. It has a soft shell type covering, making for a pliable, soft feel. Fire button location is ideal, directly under the index finger.

The shape itself is what they call "ergonomic," which, according to my trusty Websters dictionary, refers to the study of problems of people in adjusting to their environment, or adapting the working conditions to suit the worker. Perfect. What a name for this lil' goodie.

To be appreciated, this stick needed a good workout and that is exactly what it got (and is still getting). The contacts inside are actually small micro-switches that can be heard making contact as you blast away. Response is immediate as I tried the stick on numerous fast and furious type games.

My wife was subjected to close scrutiny as she whipped through the top levels of PAC-MAN. Has anyone else made it that far? She played for several hours straight without realizing the time.

That was a true test to me. She never played that long before without relaxing and stretching her hands. Dinner was several hours late, but what the hell....she had a new toy.

War was almost declared when she found out I disconnected it to show to the Users Group meeting. Nope, she wasn't going to use the old stick any more. Game time was suspended as far as she was concerned until I returned that "soft" joystick. Oh well.

At the meeting of the Central Connecticut Computer Club that month, it was received with comments of "What's that?" to "Where did you get that...it ain't out yet?!"

Due to club elections which unfortunately took most of the meeting, not all the gamesters got to try the Ergostick out. Those who did, however, wanted to buy it then and there! One ardent gamester even proclaimed, "MINE!" and tucked it under his arm. Quick action prevented that (grin)!

Like Wico says, "Playability and responsiveness second to none!" I'm going to have a hard time proving otherwise. I like it. I'm going to have to pick up another one due to my wife claiming this one.

The only, and I mean ONLY, complaint I ever heard was from my wife. You see, she has small hands and the Ergostick is a bit large for her. Even that wasn't enough to stop her from using it though.

Whew! This is starting to sound like ad copy. Can't help it. It really is that good. Try it yourself. It will be at the next meeting of CCCC. Be there and try it out. I'd really like to see how others can work with the new stick. Like the bad guy in ROBOCOP said, "I LIKE IT!"

A Living WICO Joystick at CES

A Grim Fairy Tale of A Fellow and His Computer

by Tim Holt (ST of El Paso)

Once upon a time there was a foolish fellow, whose name shall be changed to Chuck to protect the flaming twit. He was very happy with his 520ST and used it daily for all sorts of clever (HA!) and fun things.

One day, he realized that if his computer had more memory, he could use it for many more neat things, so he set out to upgrade it. While searching for the best way to go about it, he read of another fellow with the same idea. The magazine suggested a particular memory board from a particular dealer in the far off land of California, so Chuck eagerly called the dealer to buy the recommended circuit board.

The dealer, being a kindly fellow, explained that the recommended board would not fit Chuck's computer, because it was too new a model. But, the kindly dealer told Chuck, "I have another board that will fit."

Chuck excitedly ordered the memory board and the memory chips to fill it, with dreams of writing novels and creating innumerable great works of art on his soon-to-be-mighty computer.

A week passed and the board arrived, safe and sound. Chuck scurried to his local electronics supply and bought all the tools he would need to perform the delicate surgery on his favorite toy, his 520. Hardly daring to breathe, he removed the top of his machine, then the shielding over the power supply.

Peering into the depths of his dear computer, he was horrified to see exactly what the installation instructions had warned him about...the memory chips and not the ROM chips. The board would not fit!!

With great sadness, he called the board's manufacturer, but was told there was no way to make it fit, but a new board that would fit might be available in a month.

Desperate, Chuck called the nice dealer in far-off California. Good news! They had another board that would fit!! Bad news!! They could not warranty the machine unless Chuck sent his computer, his best playmate, his friend, to them in California.

With a heavy heart, Chuck bundled his 520 into a large box and took it to the local UPS office to send it on its way.

A week passed, then two, then three.

Like a doting parent, Chuck called the far-away dealer to find out how his friend was coming along. He was aghast when they told him that his 520 was not there!!

The man on the phone assured Chuck they would look for it, and Chuck called UPS to find out if they had mislaid it. UPS sent him a copy of their delivery receipt, which Chuck faxed to the dealer in California. A couple more weeks passed. Chuck was starting to feel the pangs of computer withdrawal.

Chuck called the dealer in Califonia. He wasn't in... The dealer called Chuck. He wasn't in. They played telephone tag for another week... Chuck was in agony from computer withdrawal.

At last he connected with the dealer, but his computer, his companion, his friend, his playmate, could not be found.

The nice dealer offered several options, and they agreed that Chuck would buy a Mega2 for the regular price less the cost of a 520 and the memory board that had been returned.

Great!! Chuck was happy, the dealer was satisfied...everything was OK. Right? Wrong! The dealer couldn't take the credit card Chuck wanted to use. What now?

Eventually they hit on a plan. The dealer sent Chuck a new Mega2 COD, and Chuck paid for it with a cashier's check. So Chuck got his two megs of memory, and the dealer has a phantom 520 in his store somewhere.

Moral of the Story

Atari dealers take care of their customers, but take your business to a local dealer so you know where your favorite toy is at all times!!

Atari 8bit Disk Drives
A Fisher Man's Tale and a Sharpe Point of View

by Brent Fisher & Tim Sharpe

Several years ago Brent Fisher suffered a traumatic experience. Like many veteran Atari users, he once had to use a 410 cassette program recorder as his sole means of data storage and retrieval.

For those of you who have never known the agony of using a 410, consider yourself lucky. This antiquity is the slowest and most unreliable means of data storage this side of a Commodore disk drive.

It is now known that an Atari user should not suffer with a 410 for more than a few weeks, lest insanity pervade the user's brain. Brent endured the agony of the 410 for six long months. He is only now just beginning to recover and get on with his life.

Part of Brent's therapy involves the collection of 8bit disk drives. Only by owning many disk drives can he feel the data security he longed for with the 410 cassette recorder. At last count, he owned no fewer than ten disk drives. His psychiatrist says that after he accumulates fifteen drives he will probably feel secure enough to move on to a hard drive (60 meg perhaps).

I also suffered the humiliation of owning and operating an Atari cassette recorder, but fortunately never developed Brent's sickness. I own a single Atari 810 disk drive, which is one of the few drives Brent has never owned. Together we either own or have owned just about every disk drive ever made for the 8bit line of Atari computers.

We thought a commentary on these drives, based not on technical details but on personal experience, would be informative as well as useful. Let's start with that behemoth known as the Atari 810.

The Atari 810 Disk Drive

Aptly nick-named "Atari's reliable clunker," the single-density 810 is about the size of a mailbox and just as hollow.

I understand there were a couple of different models. Mine has that classic dingy brown color that was bestowed upon the 400 and 800 Atari computers. I bought my 810 used via mail order four years ago and have never had a problem with it. Based upon my experience with the 810, the first word that comes to mind when describing it is "workhorse." Mine simply runs and runs.

But it's a noisy beast, and will emit a loud and unique snarling noise should you forget to close the drive door. It's a disk drive that shouldn't be operated at night when others are sleeping or the neighbor's dogs are outside.

It is also one of the least fussy disk drives I have ever seen; I routinely use old, throw-away diskettes that make some of Brent's drives gag.

I remember a CACE meeting at which I was supposed to give Brent a copy of an article I had written; I used a junky hard-sectored diskette (yeah, I'm a cheapskate) that had proven reliable with the 810. Brent's disk drive of the month, the relatively new XF551, nearly blew a read/write head trying to read that file. Brent's been disgusted with the 810 ever since.

The 810 is one of the most modifiable disk drives around. It's controller chip can be replaced by enhanced commercial chips which can extend its abilities and increase its speed.

These chips allow the 810 to go from humble to macho in a single bound. In short, don't let the 810's simplistic appearance and noisy operation dissuade you from buying one — there's a bit of elf-magic under that large hood.

I will now yield to Brent, who will expound on the Percom disk drive.

The Percom Disk Drive

G'day one and all. It is a pleasure to rescue you all from the clutches of Tim — to save you all from his ramblings on about his old 810 disk drive.

Now don't get me wrong, I have no serious problems with this disk drive. Well, none other than it is pretty BIG. Of course it is also slow. And then there is the noise factor. But putting all of these things aside, it IS faster than a Commodore disk drive.

Enough of my digression. Today, this very minute, I am here to speak of one of the first (if indeed not the first), and best third party disk drives ever manufactured for the Atari 8bit line of computers: the Percom Data disk drives.

First, I'll start off with a short description of the drive. As far as color goes, the outer metal shell is approximately that of the 810 that Tim has mentioned so admirably above. We are talking Atari's early fascination with the tan, brown, and beige combination.

The drive itself was either a full height or a half height five and one quarter inch mechanism of the dark brown color. Physically, the drive mechanism itself was stood on its side as compared to that of the 810. The drive stood about five and one half to five and three quarters inches tall. Also the drive was about four inches wide and about one foot in length.

I have heard other Atarians complain about the noise that their Percoms made, but I have had no problems personally. I have even been told that mine is one of the quietest drives that anyone has heard.

One of the things I like about my Percom is that it is truly a double-density disk drive. At the time I bought it, I was told that I would never, ever use double-density. Sometimes I still laugh when I think of what I use now, barely five years later.

As far as modifications go, Percom made several versions of the basic drive. First came the single-sided AT series which is one of the drives that I own. Next there was the RFD series, which included double-sided disk drives (no, the XF551 was not the first Atari compatible double-sided disk drive).

One thing that Atari users have been known for is their ability to take existing hardware and to improve it. One of the knocks against the Percom drives was that you couldn't change the drive to be anything other than drive number one. Well this is not the case any longer.

Inside the drive there is a socket that tells the controller chip just what drive number the drive is supposed to be. By rearranging the jumper wires it can be set from drive one to drive four.

To wrap up this long and lengthy bit of prose that I have been enjoying, I will simply say: If you get the chance buy this disk drive, especially if you are in need of a good one.

By the way, if anyone would like more information both Tim and I can be reached on the CACE BBS, the number being 517-787-4011. And while I'm at it, I can be reached on Compuserve! at 72337,3011.

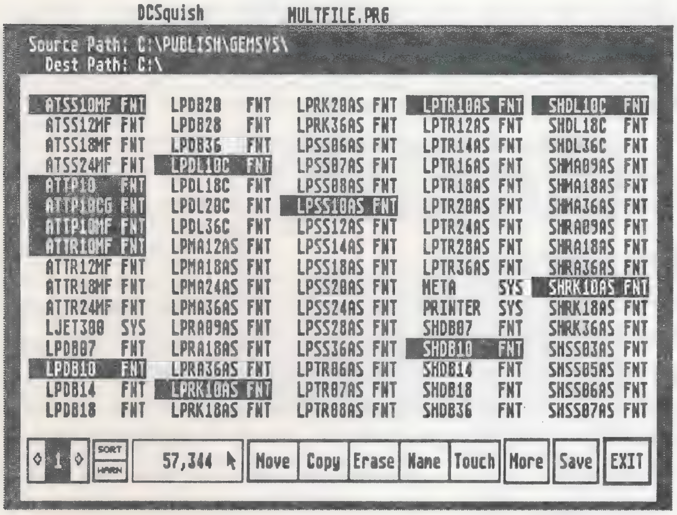
CodeHead Utilities

by Bill Rayl

The CodeHeads have done it again! Billed as "a collection of useful programs and accessories," the "CodeHead Utilities" disk has something for just about everyone. The "utilities" comes with no less than ten individual commercial utility programs/accessories and five more PD/shareware additions.



```

From a RAMdisk and a disk copier to a print spooler and picture viewer/slide-show program, the package offers the widest and most complete set of general purpose utilities I've ever seen. And, at a retail price of only $29.95, the CodeHead Utilities are a definite bargain.

MultiFile

Run as either a program a desk accessory, MultiFile gives you the ability to move, copy, erase, rename and "touch" (update the creation/modification date) any number of selected files. Up to 20 different often-used directory paths can be defined and a single click on one of these paths will take you instantly to that drive/directory.

Within MultiFile, directories can be sorted by name, size, extension, date and no sort. You can even format disks and print disk directories from within MultiFile.

In fact, MultiFile is such a useful program packed with features that make file manipulation a breeze that purchasing the Utilities is worth it just for this one program! I simply can't do justice to this program without a separate in-depth review, so I won't try to do it here. There are too many other good programs in this package that deserve attention too!

CodeCopy

CodeCopy may not be the fastest disk copying utility available for the ST, but in my opinion, it's the best. No, it doesn't make backups of copy-protected software, but CodeCopy should become a standard tool for user group librarians or anyone who has to make multiple copies of disks.

The program works by copying a disk into memory and using this copy to write single or multiple copies. This is extremely helpful to ST owners with only one disk drive — if you have a 1Meg system, you can copy a double-sided disk with one keypress, insert a destination disk in the drive and format, write and verify a new copy with just one more keypress. And all with no disk swapping whatsoever.

CodeCopy automatically checks the boot sector of your source disk. If the program finds an executable boot sector, you are warned that the disk may contain a virus.

CodeHead RAMdisk

The RAMdisk has a few features that make it stand out from the public domain versions such as YARD or RAMBABY. First, the RAMdisk can take advantage of the extra memory in a Mega2 or Mega4, with sizes ranging from 56K to 2082K! Also, this is the only RAMdisk I know of that, when used in an Auto folder, will NOT cause your ST to reboot in order to install itself. And, of course, the RAMdisk is reset-proof.

As I write this, the CodeHeads have announced that an upgrade will soon be available for the RAMdisk. The new version will allow the user to automatically have the RAMdisk install at bootup, copy files into itself, run those selected files and then remove itself totally from memory. WOW!

CodeHead Print Spooler

A print spooler is very useful in you do a lot of printing but don't have a hardware printer buffer. The CodeHead Spooler is very easy to use. Simply copy the spooler program into your Auto folder and reboot to install it with a default buffer of 64K. This buffer can be modified at any time using the supplied configuration program.

Now, everytime you print a file, you'll be able to get back "to work" while the printer is busy doing its job. The CodeHead Spooler even buffers an Alt/Help screen dump — something no other spooler has yet to accomplish.

Auto Organizer

Here's a dandy little program that can be a real timesaver. In the past two months, I've used this program no less than eight times. If you use an Auto folder and occasionally add a new autorun program to it, you'll love the Auto Organizer.

Some programs are very finicky about where they appear in the Auto folder. The Auto organizer takes the headache out of using these files. After booting this program and selecting Drive A or C, you're shown the current order of all programs in your Auto folder. To change this order, simply click on each file in the order you wish them to reside in the folder. In less time than it took you to make those selections, your Auto folder is reorganized. Slick!

Art Gallery 2.0

Art Gallery 2.0 is a simple-to-use graphics viewer/slideshow program that can display Degas, Degas Elite Compressed, NEOChrome, Tiny, Spectrum 512 and Art Director format pictures. This viewer supports color cycling in Degas, NEO and Tiny formats and Degas Elite multi-channel cycling.

To view all pictures within a given directory, Art Gallery has a slideshow mode. You can even set a "display speed," allowing you to view the files at any one of ten different speeds.

If you own Degas Elite, Art Gallery has another neat feature. If installed as a desk accessory, Art Gallery allows you to import the various picture formats (except Spectrum 512) directly into Degas Elite. Art Gallery will even load Degas pics into Elite as much as eight times faster than Elite itself!

Font Tricks 2.0

This desk accessory allows you to replace the standard, boring ST system font with a custom Degas or 8bit Atari font. A number of fonts are provided on the Utilities disk, and there are literally hundreds of fonts available in the public domain.

If you own an Epson FX80 compatible printer, Font Tricks will allow you to print using whatever font you have loaded or even in the standard ST system font.

Zero Disk

One of the simplest and smallest utilities in this package is one very big timesaver! Zero Disk erases all files on a floppy disk in less than three seconds. Although this program cannot be used to delete individual files (because it actually blows away the disk directory), it is very useful when you have a disk full of files you no longer need.

In the past, I'd found it faster many times to just reformat a disk rather than delete all files on the disk by dragging them to the Trashcan. No more! Zero Disk wipes out those files in less time than it takes to put the disk in the drive.

Lens

Lens is a rather bizarre program, to say the least. It's more a graphics demo than it is a utility. With the program, you can load a Degas picture, select a part of this picture and use that part to begin a bizarre recursive graphic "drawing" that (sometimes) becomes a fairly interesting "work of art."

If you decide you want to keep your "masterpiece," Lens allows you to save the screen as a Degas picture. Although not extremely useful, this little program is interestingly different.

CapsLock

For those users who always want to keep track of the Caps Lock status on the ST (and there are some!), this desk accessory places an arrow in the upper right corner of your screen. This arrow indicates whether or not the Caps Lock key has been pressed, and the display is available in any GEM program with a menu bar.

And There's More!

Also on the Utilities disk, the CodeHeads have supplied their most popular shareware and public domain programs — the latest versions of Arcshell, Desk Manager, Pinhead, Little Green File Selector and ShowMem.

Overall, the CodeHead Utilities is a well-rounded package of high quality useful programs and desk accessories that have found a permanent home in my utilities folder.

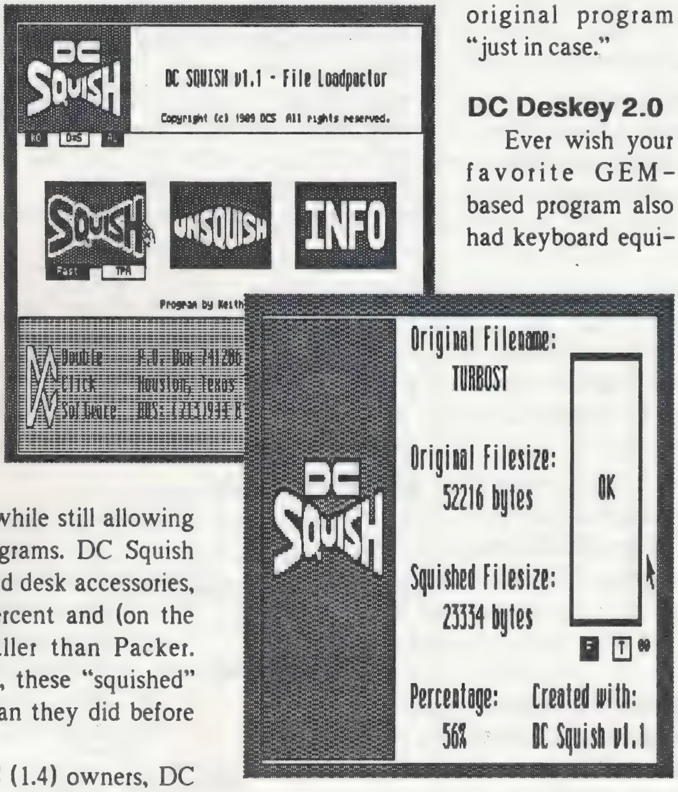
DC Utilities from Double Click

by Bill Rayl

This package of ST utility programs and accessories from Double Click Software can be summed up in one word — innovative! The six programs that make up DC Utilities are all simply amazing.... the kind of programs that make you say, "Wow!" everytime you use them. Don't believe me? Read on, skeptical one!



DC SQUISH v1.1 - File Loadpactor

Copyright (c) 1989 DCS All rights reserved.

Original Filename: TURBOST

Original Filesize: 52216 bytes

Squished Filesize: 23334 bytes

Percentage: 56%

Created with: DC Squish v1.1

DC Squish

DC Squish is similar to the public domain program Packer from Germany, a program that actually squeezes all your runnable programs, making them smaller while still allowing you to run those programs. DC Squish shrinks all programs and desk accessories, sometimes over 50 percent and (on the files I've tested) smaller than Packer. And, believe it or not, these "squished" files load FASTER than they did before you squished them!

For Rainbow TOS (1.4) owners, DC Squish also lets you set the "Fast Load" bit on your programs, taking advantage of a new feature allowing you to boot programs quickly under TOS 1.4.

Using DC Squish, I've regained over four Megs of space on my 20 Meg hard drive! I haven't found a single program that I've squished that doesn't work exactly the way it did previously, including FLASH!, Timework's DTP, PageStream, SuperBase Professional and even desk accessories like Turbo ST and MultiDesk.

DC Squish has a number of options that allow you to either overwrite the unsquished program with the squished version or to automatically make a backup copy of the original program "just in case."

DC Deskey 2.0

Ever wish your favorite GEM-based program also had keyboard equivalents to go with every option on those drop-down menus? Using the DC Deskey desk accessory, you can add them yourself!

You define the keystrokes to correspond with the items in a program's drop-down menus and then save these selections to a file with a .DSK extension. Then, every time you run that program, the .DSK file will automatically load and your keyboard equivalents will be available — providing that you have the Deskey accessory loaded, of course!

Desk accessories can also be called up from the desktop or within GEM programs using simple keyboard commands.

DC SEA

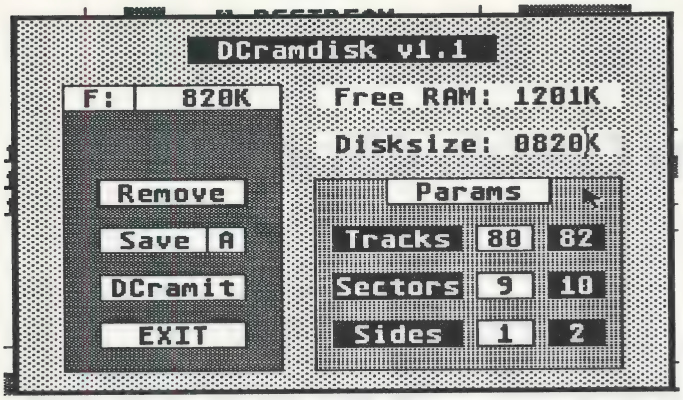
Boy, this is one neat utility. IMBers have had self-extracting ARChive programs for some time. Now, the ST also has its own self-extracting ARC (SEA) program. And talk about easy to use! DC SEA will convert any existing ARChive into a SEA — no need to unARC all those files in your club library or on you BBS. Simply run DC SEA, select the ARC to convert and then select the filename you wish the self-extracting ARC to have, ending with a .PRG extension.

Now, if you double click on the newly-created file, you're given the option of extracting the files from the ARC, printing a verbose listing of the ARC's contents to your screen or canceling the procedure. If you decide to extract the files, an item selector allows you to unARC the files to the drive/folder you choose.

DC RAMit

Here's a RAMdisk that user group librarians are going to flip over! DC RAMit can be configured to look just like a standard ST disk by setting the proper number of tracks, sectors and sides. Then, you can pack the RAMdisk with files and use the DC RAMit accessory to format disks and automatically copy the contents of the RAMdisk to floppy.

DC RAMit can also be run as a pro-



F: 820K
Free RAM: 1201K
Disksize: 0820K
Save A
Tracks 80 82
Sectors 9 10
Sides 1 2

gram to install a temporary RAMdisk that will disappear when you exit from the program. This can be extremely useful to users with only one disk drive who don't want to constantly use their "precious" memory on a RAMdisk.

DC Desk Organizer

Do you own both a color and monochrome monitor or a multisync? Do you occasionally switch between resolutions? Are you currently using an Auto program to select between multiple DESKTOP.INF files?

If you fit into any of the above categories, DC Desk Organizer is a great little utility made just for you! This utility will convert any DESKTOP.INF file into a runnable program!

Even if you only have a monochrome monitor, you may find it convenient to have a number of different desktop configurations. Using DC Desk Organizer, these configurations are now only a double-click away!

DC Xtract

If you're like me, you spend a lot of time unARCing files. DC Xtract is a small accessory (takes up only 12K) that makes unARCing files a whole lot faster than using ARC.TTP or ARCX.TTP. In fact, the good folks at Double Click claim DC Xtract is four times faster than ARC.TTP. I believe it!

DC Xtract allows you to extract files from an ARChive, test the integrity of the files in an ARChive or view a "verbose" listing of the ARC's contents. When extracting files, DC Xtract presents an item selector, allowing the files to be unARCed to the drive/folder of your choice.

Conclusions

Double Click's first entry in the commercial software market is destined to be a hit. Each of these utility programs still amaze me every time I use them. User Group librarians and BBS sysops will particularly be pleased with the self-extracting ARChiver, RAMdisk and DC Xtract.

If you're in the market for some innovative utilities, I highly recommend DC Utilities.

Hard Drive Myths and Mysteries

by David C. Troy

Hi guys! I'm back! This time, I will discuss new topics, as things have changed a little in the ST hard drive market. Last time I concentrated largely on ST506/412 drives and MFM and RLL controllers.

This time we're going to concentrate on the following topics: SCSI hard drives, access times, interleave, and drive size and its relationship to satisfying computing (parental discretion advised).

SCSI Drives

First, SCSI hard drives. It turns out, due to circumstances beyond anyone's control, worrying about a separate hard drive controller was more trouble and more expensive than it was really worth to anyone — either consumers or hard drive manufacturers. So, drives with imbedded controllers began to appear, and have competitive prices.

Since these drives have imbedded controllers, they require less cabling, space and power (which would be used for a separate controller.) These SCSI drives all bear one thing in common — they have a 50 pin connector on them. All Seagate drives which end in "N" are imbedded controller SCSI drives (example: ST157N).

The output from ST host adapters, such as Atari's, ICD's, Supra's, and Berkeley Microsystems' is SCSI. This interface is pronounced "Scuzzy" or "esseeesseye." When drives have a SCSI interface, terms like MFM and RLL are meaningless and are not relevant.

SCSI drives generally have equal data transfer rates with MFM and RLL controllers running ST506/412 drives. Right now SCSI drives are the most popular, because of their price ($599 for 50mb!).

How Fast is Fast?

Ok, on to access times. A lot of people these days seem to be caught up in hard drive access times. Hard drive access times range from about 20 to 65 milliseconds (for home users). The average time for most drives is 40ms.

Here at Toad Computers, we offer a range of equal capacity drives with 40ms and 28ms times. The 28ms drives cost about $30-$40 more each. In my opinion, and this is just my opinion based on the amount and manner in which the average user probably uses his hard drive, it's really not going to do you too much good to get the 28ms drive.

Can you count up to 12 milliseconds? Unless the drive is used continuously by a multiuser server system, or just plain continuously with continuous access, the 12ms isn't going to be noticeable.

More important here is data transfer rate, and that is equal between same-model-number drives with the access time being the only difference. In case you are wondering exactly what the access time measurement says, it says that on the average, positioning the head at the place on the disk where the information you're looking for is (starting from anywhere) takes that many milliseconds. 40ms is a good reasonable access time, and unless you think you will use the drive continuously enough to be able to tell the difference, or you're just a psychotic, you probably won't need the 28ms time.

Next, interleave. Let's just start with a practical explanation here. First, sectors lie in a circle around the center of the drive, tracks are concentric circles made up of sectors.

Suppose you have your data written contiguously on sectors that are adjacent to each other. I will use an analogy here. Suppose hypothetically that we're storing the word TOAD on our hard disk, and each sector holds one letter. We'll represent sectors as numbers on a clock (to show position.) The hard drive starts writing TOAD with the head over the 12:00 sector. It writes the "T" on there.

By the time the computer figures out what the next letter to write should be, and thinks a little, the head is over the 3:00 sector. It wants to write it on 1:00 though, right next to the 12:00 "T." So, it waits a little while for the drive to get back to the 1:00 sector. That wait is almost a whole revolution.

At 1:00 it writes the "O," and by the time it's ready to write the "A," the disk is already to 4:00. So, it has to wait for it to get back to 2:00. And it goes on like this.

This situation that I described is a situation where you have 1 to 1 interleave, (everything written contiguously), and the computer and drive are too slow to be able to cope with it. If it were fast enough, it could write at 12:00 and be ready to write 1:00 just as it got there, rather than having to wait for partial revolutions.

So, in reality, depending on your interface, drive, and other things, a 2:1 or 3:1 interleave might be preferable. A 3:1 interleave in the hypothetical situation that I described would cause the drive to write the "T" at 12:00, the "O" at 3:00, "A" at 6:00, and the "D" at 9:00. And it wouldn't have to wait for any revolution dead-time. The wrong interleave can make things dreadfully slow, and the right one can be your best medicine. It is necessary to experiment with your software and drive to see what yields the best results. On the ST, most drives are able to handle a 1:1 interleave alright.

A lot of people say to me, "Dave, what's the real difference between 5.25" and 3.5" drives?" And I've always been tempted to say "About an inch and three quarters..." But, speaking in a general sense, that is the truth. 5.25" drives, are bigger, require more power, and can hold more in some cases simply because of their greater surface area of disk media.

For example, Seagate makes an ST225N, 20 meg drive. It requires 16.8 watts for power and is a 5.25" drive. They also make a ST125N, it requires 9 watts for power and is a 3.5" drive. It also is a 20mb drive and is functionally equivalent to the 225N. On the other hand there is a ST296N 85mb 5.25" drive, and an equivalent capacity has not been shoved into a 3.5" drive. 3.5" drives might last longer, and they might run a tad cooler, but then again they may not — it depends on YOUR situation. Also, a lot of people think the 3.5" drives are a lot faster. Not so — the data transfer rate is almost always the same, and equivalent access times can usually be obtained. (Seagate ST151 has same access time as ST251). So, that's drive size for ya!

Also, as an added bonus because I figure "what the hell," people ask me a lot about power, too. I say, "I enjoy having it..." No, really... Hard drives require +12VDC at about 1-2 amps, and +5VDC at about 1 amp. Make sure you have enough watts to power your HD. Drive cases generally use a standard connector that is used in hard drives and in floppy drives (4 pins - +5, +12, 2 grounds). That's all for that.

So, I hope this article has been informative and helpful in making some sense out of this whole hard drive thing. If you have any questions, please give me a call. Thanks for listening! Thanks for your support!

Special Offer!

Beginning in January, 1990, Atari Interface Magazine will offer an ST/Mega Disk of the Month. This double-sided disk will be crammed full of the latest public domain and Shareware programs from sources such as CompuServe, GEnie, Delphi, Usenet and overseas sources in Germany and the UK. Each disk will also contain a short article that describes the contents of the disk.

These disks will be made available on a month-by-month basis for $6 per disk (shipping included) and non-AIM subscribers will be able to select an "AIM Disk-Only Subscription" for $60/year (a $12 savings).

But, if you subscribe to Atari Interface Magazine, you can get the ST/Mega Disk of the Month for ONLY $50/year! That's like getting over three disks ABSOLUTELY FREE! To take advantage of this new disk offer, fill in the appropriate items below (as well as your name and address on the above form).

YES, I wish to receive your ST/Mega Disk of the Month. I am an Atari Interface Magazine subscriber.

☐ Payment in Full Enclosed ($50) ☐ Installment Plan: $25 enclosed, bill for balance

Please sign me up for your ST/Mega Disk of the Month Only Subscription. I do not wish to subscribe to AIM.

☐ Payment in Full Enclosed ($60) ☐ Installment Plan: $30 enclosed, bill for balance

AtariWriter + for Those Who Don't Want to Read the Book -- Part IV

by Jimmy Boyce (CACE)

On to serious business. Where was I? Oh yes, Highlighting Errors <pg 51>. Yes, that is where we are in our spelling correction part of this series.

For reasons that escape me, you may just wish to see what words you have misspelled without correcting them. Soooo, this is what you do. I don't think I will go through the procedure of loading ProofReader again (please check the October issue of the Atari Interface Magazine for that). Load a file from your AW+ file disk and strike the [H] key with whatever finger you strike it with, and follow the prompts on the screen. If you want to quit this process just strike [ESC]<PG52>.

Another thing that you can do is print out a list of the words that you have misspelled. For you young people, this is a great feature because you can learn to spell those words correctly for future use.

Turn on your printer. If your printer is allready turned on, and you have been using it, then switch it off and then back on. Don't ask me why, but the book <pg52> says, "DO IT!" so do it. When you have loaded the PR and the menu appears on the screen, depress the letter [P]. There goes the printer, and there is your list.

Searching for the Words

The next part may seem a bit complicated, but once you have been through it, it becomes fairly easy. This is the Search Dictionary <pg54> portion of this little treatise. Now, as we discovered last month, when you are correcting errors and you know the word is correct that you just hit <RETURN> and continue on, or you can hit <C> and correct it yourself and continue on, or you can hit <D> and start the following process: you will be asked what word you wish to search for. That is just like being told by your teacher to look it up in the dictionary. It drives me to distraction.

Finding the Words

However, if you think you know at least the first two (2) letters of the word, then type them in and press [RETURN]. At this point, words will begin to appear at the top of the screen, and at the bottom of the screen it will say [RETURN] TO CONTINUE SEARCH, [C] TO CANCEL.

If you type in the letters "TH" then all the words in the PR dictionary will begin to appear at the top of the screen in little groups, and as long as there are "th" words to be viewed, they will appear.

When you find your word strike the [C] and you will be asked what word you want to search for, just hit return and then you will get the original menu with the words still at the top of your CRT. At that point you type in [C] again and you begin typing in the correct spelling and then [RETURN].

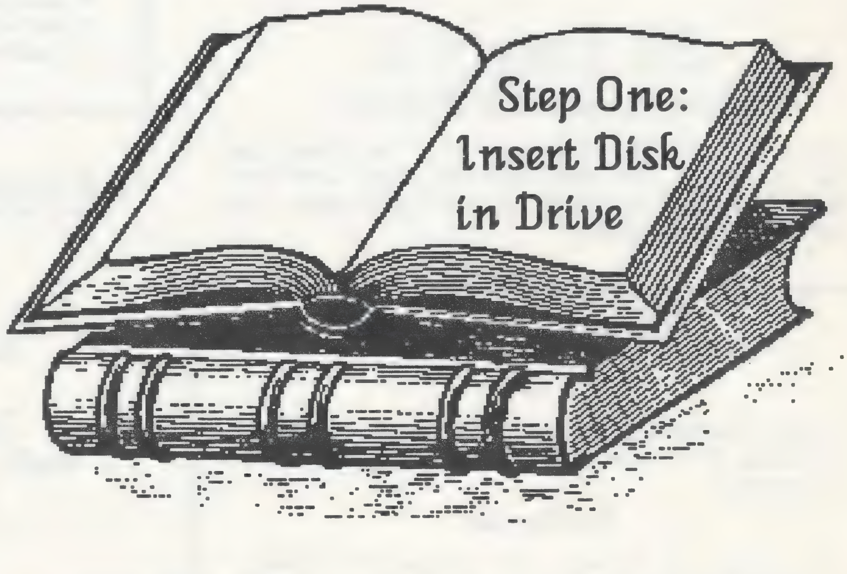
Saving Your Masterpiece

As your disk drive whirrs and purrs, the computer continues its search for flaws in your ability to spell. If it should find another, then the whole process shall begin again until you are done with the file.

NOW, save that file! Yes, you can do it while in the PR part of AW+, and you can load your next file to be proofed also. Remember, any time you get stuck, lost or disoriented, just strike the [ESC] key and you are back to the PR menu.

Previews of Coming Attractions.

Setting up, saving, and adding to your personal dictionary. See ya next month!



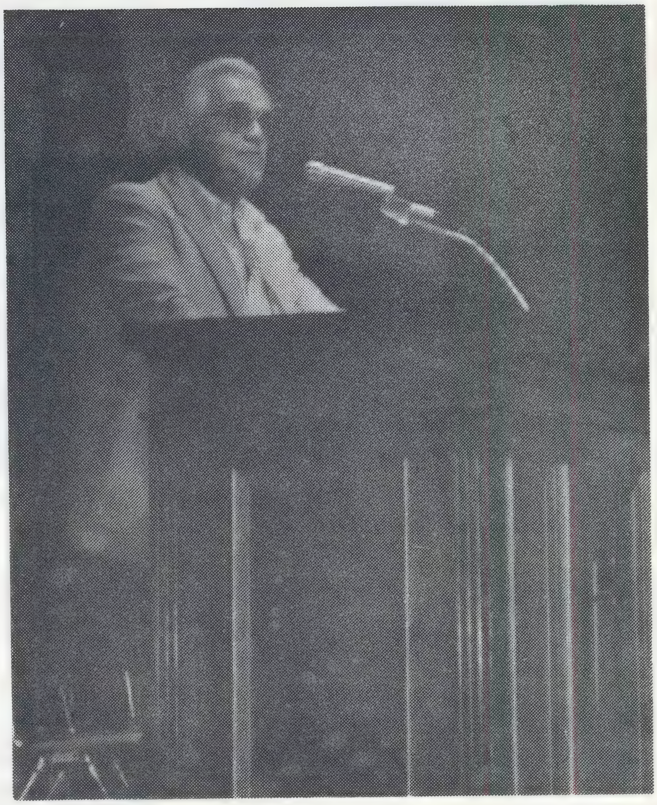
WAACE Show Report

by Pattie Snyder-Rayl

I've found shows revitalize my Atari enthusiasm, and the WAACE Show, held October 6 and 7 in Fairfax, VA, did this more than usual! Part of the revitalization came from the crowds of interested Atarians gathering, like moths, around the latest and greatest Atari software and hardware. The rest of the revitalization came from talking with Atari's User Group Coordinator Bob Brodie and the many Atari developers who exhibited at the show.

By crowds, I mean estimated figures for the attendance over the two days came to 3,000 Atarians. There were 8bit people and ST people eagerly looking over the "tons" of available software and hardware brought by vendors eager to sell their inventories.

Every time I toured the show exhibit floor, there were plenty of people at each vendor's table, with most people crowded around the Atari booth and the booths of Atari stores like Toad Computers, CAL COM, L&Y Electronics, Diskcovery, Joppa Computers and the Electonic Clinic.



Sig Hartmann

ATARI
ATARI

WAACE Show Seminars

I was not able to attend many of the seminars, but the attendance on these was very good, with more than 300 people present at the seminar by Sig Hartmann of Atari Corp.

There were also all-day seminars on topics like MIDI-Maze, Desktop Publishing and Macintosh Emulation (where Sandy Small had guard-duty over the latest version of the Stacy Atari Portable).

The one-hour seminars included talks on "Computers and Kids" by Dorothy Brumleve, "Why Some Programs Stink" with Andrzej Wrotniak and "Ask ST Report" with Ralph Mariano. James Allen, Dave Small and Dave Troy hosted a seminar on "Atari Hardware Add-ons." Other seminars were "Speeding Up the

Atari Corp's Bob Brodie and Gadgets by Small's Sandy Small

Atari" with Wayne Buckholdt, "NeoDesk 2.0" with Rick Flashman, "Grass Roots Atari" with Ron Kovacs and Bill and I and the "Past, Present and Future of Atari" with Sig Hartmann.

Seminar with Sig Hartmann

Sig Hartmann had many interesting things to say during his talk. He started by reiterating what Sam Tramiel stated recently about the Federated mistake, "Federated is behind us."

He pushed on to more current events like advertisements appearing for the Portfolio in the Wall Street Journal and USA Today, with more to come in the next quarter.

He said the Stacy is in its final form and is at the FCC for approval for the second time. The STE is at the same stage, and Sig said getting FCC approval usually means 6 weeks, and they "should definitely ship by the end of the year."

Research and Development

Sig stated of the new Lynx, "We are still in the game business." He added the game machines are nice money makers for Atari's research and development department.

He also said CD Roms were in the hands of about 200 developers and there currently is "not enough software available yet." He predicted the CD Roms would be released shortly, if the packages were available for it.

Plans for the Future

He continued by saying Atari "still does not have good distribution on the ST, but we do have enough products available." He said Atari plans to push the Desktop Publishing packages more than they have in the past. "We are getting orders from one of the major banks in the US."

"I want to thank you users for your patience. There will definately be a change by next year. We are doing everything we can to recoup the US Marketplace," Sig said. "We have to listen to our developers...our dealers. For four years, we didn't do beans."

User Group Coordinator

Atari's other spokesman, Bob Brodie, was kept very busy talking to show goers about User Groups and their interaction with Atari and trying to answer questions which were, at times, a bit out of his department.

He was grilled about building dealerships in the Pennsylvania area. He was questioned about the lack of availability of TOS 1.4 ROMs in some areas of the East Coast, and some dealers talked

OMS
Orion Micro Systems

Keith Ledbetter of Orion MicroSystems

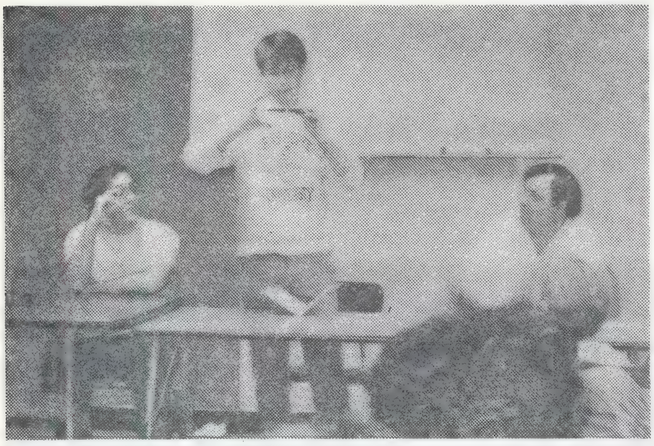
Nathan Potechin (left) of ISD and Ralph Mariano to him about their problems getting Portfolios and other hardware.

Bob Brodie held a breakfast meeting on Sunday morning with several members of User Groups present at the show which seemed to reiterate the usual difficulties User Groups have in the face of the realities of the Atari marketplace.

The AAD

Also during the show, a developers meeting was held, and from this meeting sprang the beginnings of the Atari Association of Developers which is now taking form in a special area on the GEnie Atari Roundtable. For more information on the AAD, please see the article later in this issue. Just as User Groups are combining into a stronger voice to be heard by Atari, so are the many Developers.

Paul Lee (left) and Mike Vederman of Double Click



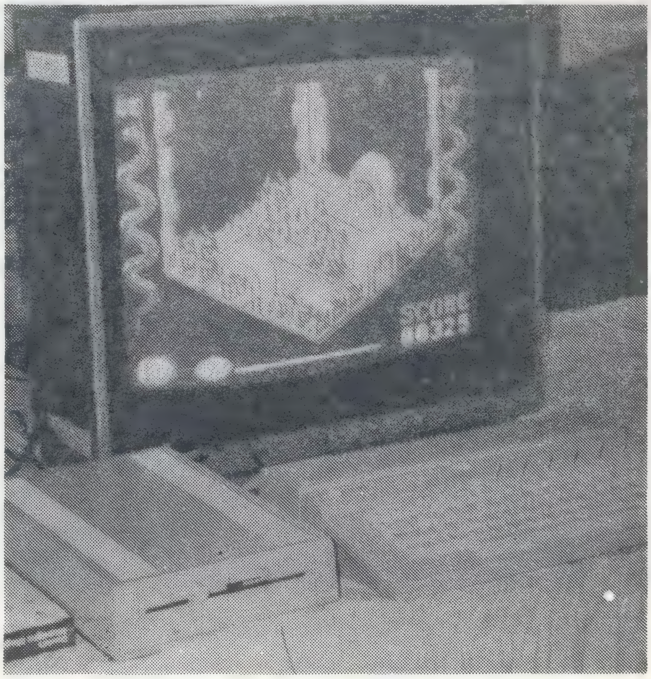
(From Right) Jim Allen, Dave Troy and Dave Small

Who Was There?

There were both small and large developers exhibiting at the show — all the way from the "one man band" operation at Waterfall Software to the highly expert people staffing the ICD booth. Other vendors were Double Click Software showing off their new Desktop for the ST, Current Notes selling lots of PD software, ST Plug Magazine who came all the way from Canada, Unicorn Publications selling AIM and The Lost Scrolls of Mt. Anaias, STatus Disk Magazine selling subscriptions, ZMag selling newsletters, Analog selling back issues and taking subscriptions, ST Informer offering upgrades on Universal Item Selector and Accusoft sellling piles of PD software. Xlent Software was selling T-shirts with comic characters for computer terms, WinterTech was demonstrating their astronomy program.

Other exhibitors showing their software and hardware were Alpha Systems, BEST Electronics, Gribnif, Seymor Radix, Orion Micro Systems, MichTron, SoftTrek, CodeHead Software, Wizztronics, Johnsware, Lantech Systems, Strata Software, 1st Stop, Accustar, Diverse Data Products and Rock Digital.

The overall atmosphere at the show was very positive and laid-back. There was plenty of room for day-long as well as the more specialized hourly seminars, and no showgoers complained about not receiving their ticket price-worth from the show! The show was pronounced a success by both vendors and showgoers.



Atari's Booth was showing off the 8Bit Airball game

The Atari Association of Developers

Washington D.C.

October 8th 1989, this morning over 40 Atari developers attending the WAACE show gathered to discuss many issues facing developers in the Atari community and the formation of a developers association. This spirited 2 hour meeting resulted in the agreement that an organization of developers was needed and the establishment of the "Atari Association of Developers".

A temporary board of directors was approved consisting of:

- Gordon Monnier, President of Michtron Corp.
- Nathan Potechin, President of ISD Corp.
- Rich Flashmann, President of Gribnif Software
- John Eidsvoog, Partner in Codehead Software
- George Morrison, President of Alpha Systems
- James Allen, Vice President of Fast Technology

The temporary board was given the task of developing a constitution for the AAD, a set of membership guidelines and qualifications, and a set of goals which the association will work to achieve.

What is the AAD?

The AAD is an independent association that seeks to strengthen the developer support structure already provided by Atari Corporation. "Developer Helping Developer" is the motto of the AAD which will provide support to the Atari development community.

Direct support to developers will center around the online pay service, GEnie. GEnie officials have pledged support to the AAD and have a long history of assisting Atari developers to bring technical support to their users. GEnie currently plays host to direct online developer support from Atari Corporation.

The AAD currently seeks Atari developers to join in this effort; all registered developers qualify for AAD membership. This association is devoted to the exchange, expansion, and coordination of developer information and related activities. The goals of the AAD are divided into the following categories, listed in order of priority:

- Development and expansion of developer guidelines which will (in addition to the already published developer's documentation from Atari Corporation) assist developers in creating problem free, efficient, and complete hardware and software products.
- Exchange and discovery of information which will assist developers in producing professional, complete, and problem free hardware and software products.
- Assistance and support to developers in the marketing, distribution, promotion, and support of developed hardware and software products.
- Offer assistance to Atari Corporation in the Sales and Marketing of Atari products in concert with developer products.

AAD Membership

There are two types of members in the AAD, these are defined as:

- "AAD Developer" – Any developer who is registered with Atari Corporation as a "Registered Developer" and is such recognized by Atari Corp.
- All "AAD Developers" will have access to development support from the AAD and Atari Corp.
- "AAD Professional Developer" Any developer who has proven to have created or is creating a viable hardware or software product for the Atari product line, with the intent of releasing this product into the commercial market. Shareware products may qualify on a case by case basis.
- Public Domain products do not qualify as commercial products, nor do hardware products which are assembled from other developer's kits or parts.
- A member must first qualify as an "AAD Developer" before being considered for "AAD Professional Developer" membership.
- "AAD Professional Developer" specific support will consist of business related assistance to help commercial developers bring products to market.
- All development support provided by the AAD will be provided to all "AAD Developers" in concert with support currently provided by Atari Corp. All "AAD Developers" will have access to development support provided by the AAD.

What AAD is Not

It should be noted that the following

are NOT part of the purposes or intention of the AAD:

- Handling of complaints that developers might have with Atari Corporation.
- Replacing the developer support presently offered by Atari Corporation.

How to Join AAD

Developers who wish to join the association should first join the GEnie online service by calling 1-800-638-9636 or sending a letter to: GE Information Services, 411 N. Washington St., Rockville, MD 20850.

Once online, send Email to "TOWNS" to request Atari Developer RT access, and to "PERMIT$" to apply for "AAD Professional" membership. When admission to the Developers RT is granted you will be recognized as an "AAD Developer" member.

Developers currently online at GEnie and interested in becoming "AAD Professional Developers" should answer the following questions and send via GE EMAIL their answers plus request for membership to the "PERMIT$" mail address on GEnie. More information can be found in the "AAD" category in the Atari Developers Roundtable:

- What is your name?
- What company do you represent?
- What is your mailing address and daytime phone number?
- What software or hardware products have you developed or are in the process of developing (for commercial release)?
- State you agree to the rules and Regulations (listed below) for AAD Professional Developer.

Upon review of the application developers will be permitted access to a special "Category 70" for "AAD Professional Developers" in the Atari Roundtable on GEnie.

The AAD "New Members Committee" retains all rights to refuse any membership to the "AAD Professional Developer" Category which it feels would not result in the benefit of the association. It also reserves the right to make any exceptions to the above requirements. All decisions are final.

Rules for "AAD Professional Developers"

As an "AAD Professional Developer" you are required to comply with the following set of rules. Failure to do so will result in the removal of your "AAD Professional Developer" status.

- Unless you have been given the specific permission from the Board of Directors of the AAD, any information released in the "AAD Professional Developer" category area in the Atari Round-table shall be considered "Confidential".
- You will not represent yourself as a representative for the AAD without the explicit permission from the Board of Directors of the AAD.
- You will not make any public statements, comments, or take any public action which would cause bad press, harm, or misconceptions about the AAD.

We ask all Atari developers who have not arranged access to the GEnie online service to please do so, and who have not registered as developers with Atari Corp to please do so also. Please join with us and help raise the level of Atari Software to new heights.

The AAD represents a clear step forward for the future of all Atari development efforts. Working in concert with Atari Corp, the AAD will raise Atari product awareness worldwide and ease the entry of new products and developers into the Atari marketplace.

A-C-C-T

Atari Computer Club of Toledo is an independent user group. A.C.C.T. is the only Atari user group in the NW Ohio/SE Michigan area that provides help and support for and from both 8 and 16-bit computer users.

Club members receive, as part of their dues, Atari Interface Magazine and access to the 8-bit and ST public domain software libraries. Disks are $2/8-bit and $3/ST, non-members may purchase disks at a slightly higher cost.

A.C.C.T. meets on the second Monday of the month from 7-9 pm at Bassett's Health Foods, 3301 West Central Avenue (Westgate Shopping Center), Toledo, Ohio. 8-BIT SIG held monthly at the home of Jim Herzberg. Dates and times announced at meeting. ST SIG held monthly at the home of David and Brenda Micka. Dates and times announced at meeting. A.C.C.T. may be contacted at 6107 Greenwycke Lane, Monroe, MI 48161, by calling Dave Micka or Michael Justice or via Fantasy Island BBS.

President	David Micka	(313) 241-1157
VP/8bit Librarian	Michael Justice	(419) 242-7797
Secretary	Sharon Hill	(419) 423-2135
Treasurer	Rose Taylor	
ST Librarian	Brenda Micka	(313) 241-1157
F:antasy Island BBS (3/12/2400)		(419) 691-6459

The October meeting of the Atari Computer Club of Toledo met at Bassetts's Health Food Store at the Westgate Shopping Center. President Ellen Lentz called the meeting to order.

These minutes are sent to members through the Atari Interface Magazine. With the copier breaking down and the lack of articles to support the newsletter, the board and others felt this magazine was the best thing to offer our club members. A.I.M. also has a ST D.O.M. which will start in January and is talking about starting an 8bit.

Kevin Rutherford reported Michtron has an IBM emulator for the ST called PC Speed. It takes ten minutes of soldering to install. It has a list price of $399 compared to PC Ditto II at $300.

ST-Log will merge back with Analog beginning in November. Disks are no longer available at newstands. You will have to send or subscribe to the Magazine to get them.

October was election month. The results are listed above. Gene Curtis volunteered to do the 8bit DOM after the first of the year. The ComputerFest will be at the Masonic Auditorium's Great Hall on November 5th from 8:30 to 7. We will have two tables at our usual location. We will demo Falcon and others not decided on as of press time. PD disks will be available for both ST and 8-bit.

The ST SIG made a field trip to the software stores in Detroit. They spent the rest of the meeting trying out the new programs.

Next meeting is Monday, Nov. 13 at 7 o'clock, at Bassett's.

From the Prez Greetings from Toledo! I would first like to extend a BIG thank you to AIM for affording us the opportunity of become a participating club.

ACCT (as with everything else) will have a new look for the '90s. We've started by participating in the Toledo Gaming Convention held on October 7-8 at Scott Park Campus of the University of Toledo and full-scale participation in ComputerFestival '89 at the Masonic Hall on November 5th.

The Toledo Gaming Convention is an annual event put on by Mind Games, Inc. Thanks to Donn Buerger, Dan Elmore and Bill Rodawalt for providing the equipment and software. Our participation in ComputerFestival '89 promises to be a steppingstone to more club involvement in the local computer community in 1990, and to show that Atari is alive and well and living in Toledo... More on the show in the next issue of AIM.

To All whose Memberships have lapsed — Rejoin before December 31st and receive a 13-month membership and subscription to Atari Interface Magazine at the regular yearly rate.

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts is the Atari Club in and around the Jackson County area. The main purpose of the club is to help inform new users, and to promote the use of the Atari Computer in the community.

President	Brent Fisher	(517) 764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The C.A.C.E. BBS. is run by the club and is open to anyone with a modem. The number to call is 1-517-787-4011. The current membership dues are $14.80 per year, and are payable at any of the C.A.C.E. monthly meetings, or by mail to the P.O. Box. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter.

Any written communication with C.A.C.E. should be sent to: P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place in the basement of the East Side Lounge at 2214 East Ganson, Jackson, MI.

Fishin' Around This month's column will more than likely be rather short. The reason that I say this is because I have just received my upgrade for the XF551 to change it into a 3.5 inch 720K disk drive. I just can't wait to get started.

But of course, before I can do that I really must get this column done and out to AIM. Now that I'm thinking about it, Atari did get my brand new XF551 out to me in UNDER three weeks. It was either divine intervention or just blind luck. Anyway I received the new DOS-XE with the drive, not that I'll probably use it, but just in case I get tired of SpartaDOS.

Hybrid Arts is offering some fantastic prices to user group members who would like to get some of their software/hardware packages. For example, they are selling MIDI Trak III for $89. Also they are selling MIDI Maze for the ST for $10. If anyone is interested in these great deals contact me before November 20th.

To Don Neff: I would have sent you a copy of MAM that your 8bit hardware articles appeared in if I had known that you weren't receiving one. What I guess that I'm saying is that I have enjoyed your articles and if you would publish more of them for the 8bit I will defiantly read all that you write.

The next meeting of CACE will take place on Sunday November 12th.

Central Connecticut Computer Club

The Central Connecticut Computer Club is the oldest, still operational Atari club in the state. Conceived in December of 1980, and operational in January of 1981, the CCCC continues to serve the Atari community. New blood is welcomed, and of course, old hands are always welcomed back.

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at Eastern Computer Video, 1207 Meriden-Waterbury Turnpike, Milldale, Ct. 06467.

Prospective members may call Rich Scheidel (203)589-9035 or 589-3738. Failing that, call Tim Brandt, (203)283-0500, or write, CCCC, 127 Pinnacle Rd., Bristol, Ct. 06010.

Dues are $25.00 per year,$30.00 for family plan. Includes Voting membership, Newsletter, access to Club library (8-bit and ST), access to Club magazine library, discounts on computer and video supplies at Eastern Computer-Video, and access to the Club message base at Ultra Project BBS.

Yo, addicts! We have not yet held another meeting since we decided to throw our lot in with AIM. I've got to say that the members that showed up at the September 20th meet were impressed by the freebie issue of AIM. Enough so, that there was NO discussion on adoption of AIM as our official newsletter. So, hats off, kudos, and three "atta-boys" to Pattie and Bill.

We still are relying on my Mega for a club computer. I'm getting tired of hauling the system down every month. Supposedly, Joe Donovan says we'll have something there soon. If not, how's about we check into a good used ST to leave at Eastern Computer?

One final thing to be shored up is our ST library. John Shea apparently hasn't the time to devote anymore. I will "temporarily" (heh-heh) start to whip this area into shape, myself, if need be. Which reminds me, we have an open post, that of Vice-President. Any takers?

Due to the fact we didn't have a newsletter for most of last year, the excess funds are going to pay for your subscription to AIM for most of the year. That means dues, this year only, will drop to reflect this. In the meantime, enjoy AIM, and remember that January will be re-up time and it'll be a special deal.

C.O.A.C.

Central Oregon Atari Club

- Dedicated to Central Oregon Atari Users and Enthusiasts Since 1986 -

President	Norman Moore	(503) 447-3598
Vice President	Jim Downes	(503) 382-0123
Treasurer/Editor	Glenn Dulin	(503) 382-3956
Secretary	Nancy Kanski	(503) 548-8201

Address: PO Box 6824 Bend, OR 97708. Membership dues are $1.00/month and $1.00/year for each additional family member. We meet every second Saturday of the month at 5pm at the Ann Rita Conference Center, which lies just in front of St. Charles Hospital on Neff Road in Bend.

Elections in December Just to remind all of you to come to November's meeting ready to nominate your favorite candidates to fill the club offices because we will have our elections in December. Be sure to come to the meetings, otherwise, you may get voted in! (Just kidding!) I hope to have the nominees for you in the next newsletter.

Look around these pages, these clubs are from everywhere aren't they? This is our first time upon these pages, and I'm pleased and proud to be a part of AIM and to be associated with all the other great Atari clubs that gather here.

We at C.O.A.C. are made up of people who live in an area in the heart of Oregon. We meet in Bend, a town that lies in the shadows of the Cascade mountain range, volcano country.

Our altitude here is about 3,400ft with the mountains ranging 9,000 to 10,000ft. We have lakes and rivers and forests and to the east about 20 miles lies our high-desert country. The Deschutes River flows through Bend on its way north to the mighty Columbia River. There is skiing in the winter at two nearby mountain resorts. The area's primary industries are forest products, tourism and agriculture. Much of our surroundings is National Forest and BLM. So, you can go from sagebrush and juniper trees to farms and ranches to forests to rocky mountain slopes of snow and glaciers, all within about a fifty mile radius.

See you next month. Glenn

GKAUG ATARI

GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets the second Saturday of each month at 11:30 am in the Arcade Center -STAR WORLD- accross from the Southland Shopping Center.

President	Frank Fellheimer	(616) 657-6106
Vice President	Dan Youngs	
Treasurer	David Bryant	(616) 349-6063
Librarian	Bill Berner	
Archiver	Dave Oldenburg	

Mailing address for club information: 3218 Lincolnshire, Kalamazoo, MI. 49001 Next meeting: Saturday, Nov. 11, 1989. Call the GKAUG BBS (2nd System BBS) at (616) 385-2448. We run it on a 130XE with the 320K memory expansion, seven double density drives, and we are BBS EXPRESS! PRO node #197.

Attendence at the October meeting was eight members. This was our first meeting at our new location. We had a 19-inch TV hooked to our 8bit Atari computer, so it was a lot easier to see the demonstrations.

We saw a demo program from the Atari Fleet BBS. It was quite impressive. It is a picture of a battleship with guns that fire, waves in the water, a title with the rainbow effect, a scrolling line with information about the BBS and music also! Got this one from the Mouse BBS in Indiana at phone: (219) 674-9288. We also saw a video, "The Art of Computer Animation," by Pacific Data Images.

Still have not decided what to do concerning the organization of the club. I am still doing the duties of treasurer, and I'm not even a member! If you want any say in what happens to it, you have to attend the meetings, or even consider becoming an officer. It's up to you.

I will try to have more interesting items at the next meeting. (I am working on an Atari Artist picture viewer program that uses the expanded RAM in your 256K 800XL or 320K 130XE. It will make the pictures change very fast. Hope to show it at the next meeting.)

Meeting at STARWORLD in Portage. The address is 6151 S. Westnedge Ave. After the meeting, there are facilities for lunch, and an arcade room with REAL ATARI ARCADE GAMES!! Still Computing... David Bryant Acting Treasurer

Great Lakes 'GLASS', Michigans only
Atari 'ST' only Users Group
ST Support I ♥ my ST!

Meetings - First Thursday every month, 6 p.m. to 9:30 p.m., Athens High School, 4333 John R, Troy, MI., 1/10 north of Wattles <17 Mile> - Room 1528 - Mailing Address - P.O. Box 99737, Troy, Mi. 48098 -- Steve Mileski, president

Dues - $1.00 per month, ie:join in April - pay $9.00, all memberships expire on January 1, each year. Non-members welcome at no charge.

President's Monthly: October 17th already. Is it just me, or are the summers getting shorter every year? I am not looking forward to shovelling that white stuff again. I am looking forward to that upcoming turkey dinner followed by a very intense couple days at the Atari (with interruptions from my 1 year old son) catching up on all the software acquired through the summer that I have yet to try out.

I have already started by sorting through a software box that has not even been opened for a year or so. I am coming across programs I got years ago that I did not see the value in then, or simply did not know how to use them. My latest HOT item is macros. While I was storing away a copy of the Textpro disk from the club library, a DIR revealed some files I didn't get when I first downloaded the program a couple years ago.

One of the main items I missed was the macros that you can create to perform tasks for yourself. So now I am trying out everything I can think of with them (without really knowing how yet). I think with the right macros, Textpro can be a better word processer than any other for the Atari, and even rival the expensive ones for that 8088 machine many of our friends are moving up to (did I say up?).

I have also found a couple programs to create macros for DOS or just about any other program you might use, so now my Sparta-DOS commands are a simple single key combination instead of the usual little words. Once you get used to the key presses, it sure makes it a lot faster to do even simple disk keeping chores. User group members should look through their library listings and find some of these programs and try them out for themselves. Things like this make the Atari seem less like a game machine that has a keyboard, and more like the powerful computer that we have been trying to get across to the rest of the computer world for years.

The disk library database is in progress again, in the capable hands of Gary Heitz. We hope to have some more to show you in a little while. First impressions of the modules that where shown at the last meeting seemed good, we hope you like it and will use it when it is finished.

The new GRASS questionnaire will be included in this issue, so all GRASS members please fill it out and bring it to the next meeting so we can get a new hardware listing out for the Christmas buying season.

Well, back to the macros. See you at the December meeting.

Next LACE Club Meeting: Mark your calendar for Wednesday, November 8, and December 13 (Games Night), 1989 at the Clearfield branch of the Davis County Library from 7 to 8:30 p.m.

LACE President's Column Atari is on the move! The recent press releases on the new TT list some very exciting specifications. This new, yet-to-be-released machine could do more to bolster Atari than the ST did in 1985, or even more than the Mcintosh did for Apple. It is a greater advancement in computer technology than the Atari ST was over the Atari 8bit line.

Some facts, and interpretations as I see them, are listed below:

1. The Atari TT is based on an existing industry mini-computer standard called the VME Bus. This is in wide use here in

the US and in even greater use in Europe. It is not a dying standard like the S-100 bus, nor even stagnant. Instead, the popularity of the VME machines is still growing and will be growing more when Atari releases the TT. Other computer manufacturers are sure to follow this newest truly professional/personal consumer release.

2. The operating system of choice for the VME systems is UNIX. UNIX VME computers are presently used for process controllers in manufacturing operations here and abroad. They're also used as stand-alone software development stations. At Hill Air Force Base, they are used for real-time enviromental simulators for the sophisticated Minuteman flight computers. This standard... this machine has got POTENTIAL!!

3. Is it EXPANDABLE? Certainly this is not a new concept in computers, but it is with Atari. You see VME mini-computers are everywhere and their numbers are increasing. This standard was developed by Motorola for use of the 68000 series of microprocessors and then released to other manufacturers. At this time, there are at least a dozen or more hardware suppliers with others contemplating entering the field. Competition already has lowered prices, making VME computers some of the most economical mini-computer/controllers on the market today. When Atari releases the TT, this will further lower the prices and increase the options and possibilities.

4. Atari Corporation knows that software is and will always be the selling point of a machine. Raw power without a purpose is worthless. Not to worry though, since this is an industry standard, software is already there and waiting for the Atari TT. In fact, WordPerfect has just anounced that it will offer a UNIX-based version of their bestselling word processor. And, not to be outdone, Aston-Tate has announced that it too will be releasing Lotus 1-2-3 for the UNIX market. All this before the TT even hits the street! Plus, the TT has the added capability of running the existing Atari ST software already on the market since TOS is built in as standard equipment.

5. Standardization: The move away from the unique computer components arena to a more open and versatile machine is now and will be more important in the future of computing. The consumer desires the power but will not stand for the closed market approach that Atari and others have offered in the past. This is Atari's bold and wise thrust into the future and they should be proud of this new consumer-oriented approach.

Atari Warning: Timing is very important. If this is another of the forcasted product releases that end up never being released, then it is so long for Atari. Atari Corp. are you listening? The TT is so important for your corporate survival that an exhaustive and concentrated effort must be made to get this product to the US market before the competition gets wise and beats you to it. It now looks like you have the lead on this product. However, that advantage could easily slip to become a warehouse full of unwanted products when some other corporation hits the market first. Besides, we loyal Atari computer users are counting on you and supporting you! You've done it before, now do it again!

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Ed Hanson at (313) 675-0044 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MID-OHIO ATARI USER GROUP

Mid-Ohio Atari Users' Group, PO Box 134, Ontario, OH 44862

Well, I have to say I am impressed. I was really quite certain that the newsletter for October would show up about a week late. To my surprise it arrived on the 10th of October, five days before the meeting! Thanks have to go to Bill and Pattie, who had to take all of the verbal threats I dished out, if it arrived late <grin>. I appreciate also the logo that was whipped up (I was lazy and didn't even spend the time to do it myself). In the next few months though, it will be likely that the newsletter will show up after the meeting, so be prepared!

The meeting for November will be on Saturday the 11th, from 7pm until 9pm at A&B Computers, 1619 West Fourth Street, Mansfield, Ohio. Make sure you attend, because we will be taking nominations for next year's officers, and anyone not there is automatically nominated for the president position <hee hee>.

I have a few demo versions of games for the ST which I will demonstrate and distribute to anyone interested. I feel that manufacturers who are distributing these demos are using their heads, as the demos give a person a chance to check out the program without having to buy it first. A few disk utilities from

Charles F. Johnson for the ST will also be demonstrated.

I will also make a presentation of the Diamond OS for the 8bit, and possibly show a preliminary version of the Turbo-Assembler, for stock and Turbo-816 upgraded systems. As always, there is a need for people to bring in demo material. There must be more than just a couple people in the group which are buying commercial, or downloading shareware, programs.

The current treasurer's report by Crail Floyd shows that the group is well off financially. As mentioned last meeting, the club is footing the bill for the AIM subscription for current members through the end of the year. I would appreciate your comments on the magazine. Keep in mind that we will vote on this along with the club officers in December.

PORTS ATARI

P.A.C.E.

COMPUTER ENTHUSIASTS

President	Tracy Hendershot	525-1058
Vice President	Larry Nadeau	525-7430
Sec/Treasurer	John Zupansic	394-9326
ST Librarian	Don Henricksen	729-6309
8bit Librarian	Gary Armbrust	729-6906
ST Coordinator	Geoffrey Bennett	722-3354
8bit Coordinator	Aaron Potopinski	525-1058

PACE membership is $30 per year or $9 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local bulletin boards.

Membership includes a monthly newsletter, meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16bit public domain programs. Ports ACE is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. Any written correspondence should be addressed directly to Ports ACE, Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

From the President... Greetings from Duluth, Minnesota! We at PACE are proud to be affiliated with such a fine organization as Atari Interface Magazine. Our goal as a user group has always been to furnish members with the latest information for their Atari computers. AIM will be a valuable source of information to be used in association with our computing hobby. Hopefully, our members will be spurred into contributing submissions to this fine publication.

The logo you see above was designed by Gary Armbrust. Gary had several logos for us to chose from. Be sure to acknowledge his fine work of art the next time you see him.

Last month's Spectre 128 demo was quite interesting to those who participated. David Small has done quite a fine job in making a truly "usable" Mac emulator. Unlike the PC Ditto demo last summer, execution (emulation) was F*A*S*T! No noticeable slow-up whatsoever. We had a chance to examine many software packages for the Mac. It was agreed that the much touted MacWrite was lacking in features. Our ST Writer 3.0 has more features and is FREE. Outprint on Ready Set Go was also disappointing on my 9-pin Epson. Text and graphics have a bad case of the jaggies. The ST community is lucky to have GDOS! Other comparisons were made, and we finally adjourned wondering what all the "hype" for the Mac is all about. Software for the Mac demo was borrowed from the Duluth Public Library.

Support for our 8bit computer is dwindling despite the best efforts of 8bit coordinator Aaron Potopinski. Rumblings about the 8bit being "dead" or "orphaned" can only be reversed by YOU! If you have decided to stay with 8bit technology (which is GREAT!), SUPPORT IT! It would be a shame to see such a fine machine die an early death. The 8bit section is what you make it. Aaron will be on hand to answer questions, demo programs, show DOS, etc.

Just a reminder that there is printer ribbon reinking on our MacInker available at every meeting. Also, we have a new batch of 3.5" DS/DD and 5.25" disks. Prices are still 5 for $4.00 for the 3.5" and 4 for $1.00 for the 5.25".

Finally, Micro Simulations is the hottest BBS in the area! Aside from its 53 online games, 30 megs of ST/8bit software, multi-node "chat", 99 conferences on subjects ranging from NASA to FINANCE to PROGRAMMING, it is now networked and we are receiving messages in the Atari conference from Seattle, Tennessee, and London England! The sysop has plans to broaden his networking soon. Dig deep and enjoy what telecommunications is all about!

Our next meeting is November 19th at the Wisconsin D.O.T. Building. Call any officer if you need directions. See you there!

R A C C

ROCKFORD ATARI COMPUTER CLUB

Serving the Greater Blackhawk Area of Northern Illinois

Rockford Atari Computer Club serves the North Central and Northwest area of Illinois. We invite anyone in the area to attend our meetings. We meet at Rock Valley College, Rockford, IL; usually on the third Saturday of each month. Meetings start at 10 AM and feature demos on both the Atari 8bit and ST.

Our Address is RACC, 2379 Circle Dr., Belvidere, IL 61008.

Terry Frits	President/Editor	(815) 547-7718
Thom Lofthouse	8bit VP	(815) 654-1683
Dave Zolmierski	8bit Librarian	(815) 654-0247
Andy Learner	Treasurer/BBS SysOp	(815) 397-5316
Thelma Schafer	ST Librarian	(815) 633-1259
RACC BBS		(815) 397-5327

President's Message: First off, let me give a big thank you to AIM for the article on the Virus that is hitting the Atari clubs. I had to check out my own disks to see if they were infected at all and found three. Funny thing is, they were disks I got from another club.

The first thing I did was remove them with a Virus Killer Program, then I called the librarian from the other club and let him know of my troubles. He checked his disks and found two types of viruses and wiped them out. So maybe we are wiping this out as fast as it started, and before it can do any real damage. Thanks again AIM.

The November meeting is being held the third Saturday — the 18th. We could sure use some of you to do a demo, so if you have purchased a new program or have a really favorite old one, contact Thom or myself about showing it at the meeting. I have ordered the PC Ditto II and hope to have it in time for this meeting also but don't know if it will be done.

Also on November 12 (a Sunday) we again have been invited to the Ham Fest and Computer Fair at the Forest Hills Lodge. Our club wants to do like last year and fill the thing up with Atari Clubs, Dealers, and People. So try to attend if you can. I have invited several area dealers and clubs to come and help us out like last year. We had such a great showing then that many people asked us if we were trying to take over the show. Many said they didn't know Atari had that kind of support in this area, so what we were trying to do worked really good and we would like to do the same this year. If any of you have purchased the GCR, Vidi ST, Genlock etc. please get in touch with me so we can make special arrangements to show it.

For the 8bit people, we have just purchased 10 new disks for the DOM library. Most of them are games, and some of them are close to arcade quality. So give Dave Z a call and order a few.

See you at the meeting, Terry

BBS Report from Andy Learner Our Club BBS, CAMILLE 2000, is alive and well! After a couple of serious hardrive crashes, I have finally smoothed things out. The newer 20Meg drive, turned out to be a lemon, and after several reformats, I finally took it over to ICD who said it was bad. This past weekend, we got another 10Meg to add on, so at least we have some storage space and decent size message bases. We are currently Networking, using Keith Ledbetter's Express! Professional software. The other BBS's we "NET" with are:

- Python V - LCACE club BBS — Vernon Hills,Il
- The Warehouse - Pennsylvania
- The County Jail - Cincinnatti, OH
- The Wishing Well - Catasqua, PA

These are the principal BBSes, but many other boards call and net thru these other systems, from all over the country. This makes for some interesting, and informative, ATARI "Chatter".

We would like to extend our "NET" to include a BBS, from the Greater Michigan area, or for that matter, any other BBS, using the same software.

Last month, the phone numbers listed, were a little confusing... The actual # for the BBS is: 815-397-5327. Please feel free to call us any time. We are a 24 hour BBS system!!!

ST CLUB
EL PASO

The ST Club of El Paso is the only Atari ST and Mega user group in the El Paso area. The ST Club has proven to be a benefit not only to new users, but also to the "old hacks" of computing. We now meet twice a month at the Richard Burges Library, 9300 Diana. The first meeting is always the second Saturday of the month, at 12:30pm. The second meeting is held on the last Thursday of each month at 7pm. Meetings feature demoes of the latest ST software, as well as help for the those that might be having problems with their computers.

Membership in the ST Club of El Paso includes a year subscription to the magazine you are holding in your hands, discounts on software at Jenkins' Computer Store, and access to one of the largest public domain libraries in the nation. We also offer technical help, and we sometimes have a party or two when we run out of computer things to talk about. Voting membership is $20 a year. Sponsored and Newsletter only memberships are $15 a year. To become a member of the ST Club of El Paso, call 915-821-2048, or write the ST Club of El Paso at 10953 Yogi Berra, El Paso, Texas 79934.

President:	Tim Holt	915-821-2048
Vice Pres:	Morris Miller	594-1906
Sec't/Tres.:	Joann Anderson	751-2710
Editor:	Paul Stampfli	821-4861
Librarian:	Norm Bates	593-6234
ST El Paso BBS		751-7837
Data Retention Center		821-0006

Need Help? Call these folks:

Midi/Music	Morris Miller	594-1906
Word Writer	Tim Holt	821-2048
Word Perfect	Paul Stampfli	821-4861
DataBases	Dave Davis	779-7811
Animation	Terry Hughes	751-4587

From the Prez... Another meeting, and I am still amazed at the viability of our little group. If you missed the October meeting, then you missed Morris Miller's discourse on the Phasar Home Accountant. Thank you, Morris. Also, Mike Allen brought in his ST and showed off his TOS 1.4: Rainbow TOS.

From speaking with many of you, it seems Atari Interface Magazine is a hit. The only minus side seems to be the issues come kind of late in the month. I believe AIM has a great potential. Just think, sharing knowledge and articles with user groups all over the country! I spoke with the folks at AIM, and they are trying to make it a snazzy publication. They are also concerned that New Mexico get the issues about a week before the folks in El Paso. Says something about the US Post Office if you ask me. Rumor has it that several other user groups are going to join AIM as well. Great! The more the merrier. I hope that those folks that were chiding us on some local BBSes for joining with AIM are now eating their words! "Rip off," they said. Well, I think not.

The Christmas season is popping up pretty soon, and we will be having some exciting offings for the season. We will have a $100 raffle to Jenkins' Computers (Paul better not win this time!), and are planning on having a season get together at Cappetto's Restaurant on Montana (you will have to pay this time..sorry), and of course we will have the second club AUCTION at the December meeting. So bring your ST stuff, and earn a little for the holiday season. (You can pay for dinner at Cappetto's! See how my devious mind works??)

The December meeting will feature IBM emulators, and Paul will demo PC Ditto II. If anyone in the audience has PC SPEED, please let me know before the December meeting. Speaking of Paul, I don't know how many of you realize that we really have a budding writer in our editor. All his articles have a laid back, down-home style. He speaks his mind without offending, something I could learn if you have been on any local BBSes lately. Thanks for the articles Paul. Keep up the excellent work!

The new year rings in with a demonstration of the Migraph Hand Scanner and Touch Up. Pete Rosh has asked you to bring in any photos that you may want to transfer to disk for this presentation. Put your wife on disk! Reduce your mother-in-law to 200,000 kbits. I get goosebumps just thinking about it. February has the Spectre GCR MAC emulator being demoed, and March deals with Word Processors. April is Game Month, where the entire meeting will be devoted to the ST as a "Game Machine!"

Don't forget our second meeting of the month. I would like to welcome any new members, and encourage you to become an active member of our club. I have been delighted to see people come all the way from Las Cruces, and even Alamogordo to see our club. Spread the word, and maybe we will become a monster club like the one described by Paul in his Right Brain this month. Keep 'puting! Until next month, Tim

TACE

TINKER ACE OF OKLAHOMA

TACE -- Tinker ACE of Oklahoma meets the first Saturday of each month at 1pm (12:30 set up time) in the Moore Public Library, 225 South Howard, just off of SW4th and I-35 in Moore. TACE can be contacted at Route 5, Box 539, Blanchard, OK 73010 or at the TACE BBS (405) 755-9561, 24hours., 3/12/2400 baud, running Oasis 4.3 software with over 60megs of online storage, ST & 8bit support. Dues: Full - $20.00, Correspondence - $15.00.

BBS SysOp	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649

Where was everyone? We had a nice demonstration of the Express! cartridge... at least we would have if it was not for the unfortunate fact that the telephone in the library used a non-standard plug in. Oh well! Mr. Leazott showed us some of its features anyways.

There is still some discussion about joining up with the OKC 8bit club. What are your thoughts? We had a lot of fun, and we wish to see more of you all at the next meeting in November (which you will probably not see this before)!

Stephen C Moffit

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the last Saturday before the 18th of the month, at 2pm at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township. Upcoming meetings are September 16th, and October 14th, 1989. Officers:

President	Steve Volker	(517) 793-2955
ST Librarian	LeRoy Valley	686-6796
Treasurer/Sec'y	Marty Schmidt	792-6029
8 Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's PD library, along with a year's subscription to the Atari Interface Magazine. Check your mailing label, if you need to renew,(or haven't joined us yet!), DO IT NOW!

First Up... Listen to this fellow on-liners!! Darkside BBS, the official BBS of TAG and run magnificently by John Demo and his loyal pack of Sysops, has a special offer just for us! From now until furthur notice, for every user a member gets to subscribe to Darkside, John will contribute $3 of the subscription fee TO TAG's CLUB FUND!! We already have a reduced subscription price of $15 dollars instead of $20. This adds up to a great deal!!

When was the last time you logged on? Maybe you aren't aware of just what new features have been added lately. The board is up to 160 MEG of on-line storage, (soon to be 200 MEG), it has three nodes (active telephone lines), a 3-way CHAT mode, a separate Atari conference, and an on-line newsletter that is being continually updated by our own Mike Ranger. Maybe next time you get the "GEnie itch," you might try a Darkside "scratch" and save a little greenback too! Thank you John and Neil Demo for all the work, time and investment you have put into this BBS.

What You Missed! If you didn't make it this meeting, you missed one of the most action-packed gatherings all year. Before the formal meeting, there was a buzz of conversations everywhere. Al Jennings couldn't say enough about the new Dungeon Master genre game called BLOODWYCH (maybe we can get him to do a demo in January), and everyone was mulling around Bryant Lefreniere's equipment he had set-up for the month's demo. About five minutes into the meeting, LeRoy came barreling in with two sets of TOS 1.4 Roms, and the club as a whole gathered around a table in the back and watched as he upgraded Gerry Monroe's 1040. Though LeRoy explained that some of the other machines, (notably those with a two chip Rom set), and the Megas are more complicated, what he was doing looked easy enough for ME to do. I caught myself drooling when, a few minutes later, the new operating system was booted up. LeRoy went over a few of the improvements while we watched, like a new file select box, a more sophisticated diskcopy window, a number of new Hard drive utilities, better file management and a new FASTLOAD feature.

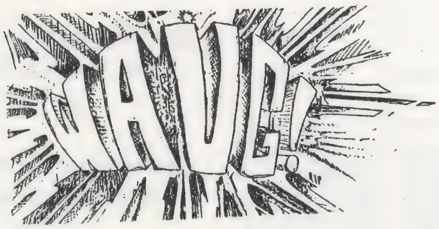
As we stumbled back to our chairs with visions of eproms in our heads, Bryant Lefreniere began his demo. Now picture this...Bryant's 1040 hooked up to LeRoy's All-Rez color monitor

(Sharp!), attached to LeRoy's new DeskJet Plus, a 40 meg drive (I don't know who this belonged to!), and the new Migraph Hand Scanner. All this and STILL the power of Migraph's TouchUp nearly exceeded that of the hardware! It runs in all three resolutions with just some minor file manipulations for printing and such, had selectable D.P.I. up to 400 dots per inch, has a number of drawing utilities that a lot of CAD programs don't have (but should). In short, it had so many features I can't even remember them all, plus it takes input from the Hand Scanner. And by using daisy-linked disks, the size of the picture is virtually UNLIMITED! Oh, and ask Neil Demo about the postcard Bryant made with his portrait on it.

What You Shouldn't Miss Remember, next month is the face off between Marty Schmidt and the word processor WordPerfect 3.2 and LeRoy Valley and 1st Word Plus. Also possibly a look at the new accellerator boards.

On Another Note The next Consumer Showcase at Fashion Square is in January and will need all the support we can get, so let's volunteer.

Equipment volunteers for November: Marty Schmidt is bringing his complete system, including his new LQ850 24 pin printer.



The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 p.m. in the Michigan Union Building on the campus of the University of Michigan on State Street at the corner of South University in Ann Arbor.

Club dues are $15 per year and provides access to the PD library and subsciption to AIM magazine. Meetings feature demos of both 8bit and ST software and hardware. Non-members and questions are welcome. Officers can be contacted by BBS on Molin's Den at (313) 420-0407.

The next meeting of WAUG will be held on November 14th in the Wolverine Room and will cover Desktop Publishing. The December meeting on the 12th, as usual, will be game night.

From the Treasurer: Hello again! The financial action for July was down considerably with only the AIM expenses and no income. In August, we added three new members to our group; Robert Dorman, Ralph Salmeron and Thomas Spangler. We also had five renewals; Greg Kemp, Roger Lundberg, Bruce Moore, Bob Parker and (winner) Jim Shillington. We also had numerous 8bit and ST disk sales, making August 1989 the record income month in the history of our group (not including Atari Show Months). We had three renewals in September; David Geiger (Ohio), James Sinkovich and Roger Tanner. The attendance at the meetings has been average, but we still have plenty of room for everyone. HAPPY THANKSGIVING to all.

Minutes of October's Meeting: The October meeting of the Washtenaw Atari Users Group was held on Tuesday, 10/10, at 7:30 p.m. in the Anderson Room(s) of the Michigan Union.

Craig announced there was some possibility of WAUG setting up a booth at an upcoming computer show, but details are sketchy at this time. The officers will likely discuss this more in the next officer meeting.

Co-editor David Brzezinski showed off his newly-acquired Koala Light Pen by demonstrating how it was more "maneuverable" and accurate than the Koala Pad for drawing. David's own rendition of a ninja turtle would make a good picture to paint on a pumpkin at Halloween, especially if he could also transfer the scrolling rainbow effect which seemed to make this poor critter's eyes come to life!

8Bit Librarian Mike Millage showed the Movie Maker system, an oldie but goodie from '82, followed by the Graphic Master from DataSoft.

Craig gave us a guided tour of the Audio/Video Sequencer by showing us the much acclaimed CatNap demo. Craig noted this version of the demo left only 170 bytes free in his 2.5Mb system.

Vice-President Rick Schrader showed us a fractal generator called Creation from STart Magazine, and gave us as good an explanation of what fractals are as most of us had ever heard. Degas Elite was next, followed by Rick's "Horses from Hell" using Pixel Pro. Not to be suppressed, Rick continued with Antic's CAD 3D and finished the evening's demonstrations with Compute!'s 3D program and the Aegis Animator which has recently been released into Shareware.

Craig announced that the officers felt it was time for the club to purchase its own ST rather than depending on monthly volunteers. The club is financially stable enough to afford such an expenditure and a poll of the members present was virtually unanimous. Responsibility for transportation/care of the computer and disk drive would fall on the Vice-President who is, according to the Charter, in charge of arranging hardware and meeting space for club events.

ST Librarian Russ Crum described the ST Disk-of-the-Month which contained The Aegis Animator, ART ST v2, GFA Object and GFA Vector and GFA Basic (as an added bonus...). Russ also announced there is a new catalog disk.

A poll was taken to determine how many of the club's members would be affected if library disks were to be made only on double sided disks. There was no dissent, so Russ will likely proceed to make changes as he sees fit in the future.

Craig announced that the November meeting would feature Desktop Publishing. Following a quick Q&A session, the meeting was adjourned at 9:30pm.

Special thanks to the good people at State Street Computer for the impromptu loan of a power cable for Craig's hard drive which happily saved him from making a quick round-trip home for the one that got away. Michael Olin, WAUG Rec. Sec'y

REVOLUTIONARY NEW PRODUCT

SWITCH BACK

REQUIRES at least 1 meg. of RAM
(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory
(Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) Only **$39.95**

Digisound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. ● The first and only full color digitizer for the ST. ● Uses standard video inputs like video camera, VCR, or video disk. ● Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. ● Pictures can be used with Degas, Neochrome, Powerprint and others. ● Automatic calibration of contrast, brightness and white balance. ● Plugs into cartridge port for easy set-up. ● Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only **$39.95**

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs DIGISPEC!

Only **$39.95**

Polydisk

Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

People Are Talking About DC UTILITIES

"The wizards at Double Click Software have decided to bombard us with several top notch utilities at once in their first commercial software venture, and are these programs ever good!"
— **ST ZMAG**

"Squish loads and decompresses programs faster than a standard ST would take just to load the same program full-size."
— **COMPUTER SHOPPER**

"In keeping with the spirit of pushing the ST and its programs to the limit or past the envelope..."
— **ST REPORT**

"You won't want to be without this superb utiltiy disk and it's a steal at the price DC is asking."
— **ST PLUG**

only $29.95

DC SQUISH Save valuable disk space! Compress executable programs and desk accessories up to 1/3 their original size! And your programs stay executable! Makes programs load faster too!

DC DESKEY 2.0 Make any GEM program 'Expert Friendly.' Assign keystrokes to GEM drop down menus in any GEM program! Over 2000 possible key combinations!

DC XTRACT A super fast, pure assembly desk accessory that allows you to xtract, test, or list the contents of any ARC file. DC XTRACT is 4X faster than ARC.TTP, only 12K in size, and always ready when you need it!

DC RAMIT The FASTEST RAMdisk bar none! Allows you to make the RAMdisk look just like a floppy! Save the contents of the RAMdisk to one file, for quick loading of the same files! MUCH MORE!

DC DSKORG Make your DESKTOP.INF file an executable program! Change desktop windows, icons, the complete desktop layout quickly and easily by double clicking one program.

DC SEA Create programs from ARC files! That's right! DC SEA (self extracting ARC) allows you to make a program that will extract or list its own ARC contents.

All programs are 100% pure assembly language

On the Cover

Seasonal Artwork from Steve Volker, President of the Tri-City Atari Group.

Managing Editor: Patricia Snyder-Rayl
Editor: Bill Rayl
Artwork: Steve Volker

AIM is produced on a 2.5 Meg Atari ST, HP LaserJet II, Timeworks DTP and PageStream.

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS. A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable). Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of AIM or any participating club. Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp.

EDITORIAL RAMBLINGS

It's December...the end of the first year of Atari Interface Magazine and our second anniversary as user-group-oriented publishers (December '87 marked our first issue as publishers of Michigan Atari Magazine). AIM has come a long way in one short year, and we're looking forward to working with all participating clubs to make Atari Interface Magazine even better in 1990.

With this issue, we've added a few new faces. The Atari Clubs of Denver is actually a "group of groups," made up of the Atari Club of Denver and the Starfleet user group of Denver, Colorado. The Middle Georgia Atari Users Group (MGAUG) of Warner Robins, GA and the ST Atari North Coast Enthusiasts (STANCE) of Lakewood, OH have also begun participation in AIM as of this issue. We've also added one affiliated club, the Mid-Florida Atari Computer Club.

Last month saw the addition of the Atari Computer Club of Toledo (ACCT), the Central Oregon Atari Club (COAC) of Bend, OR and Ports Atari Computer Enthusiasts (PACE) in Duluth, MN.

In January, look for the Rushmore Atari Computer Enthusiasts (RACE) of Rapid City, SD, the Bluegrass Region Atari Computer Enthusiasts (BRACE) from Lexington, KY and the First Atari Computer Club of Spokane (FACCS) in Washington state!

TOS 1.4 Update

In last month's editorial, we discussed our having been sold pirated TOS 1.4 by a local dealer. This month, we have a couple updates to keep you informed.

First, according to Atari's head of engineering, Ted Maciejewski, several dealers were shipped TOS 1.4 that did not have a label containing the word "RAINBOW." These were chips sent in mid- to late-July and had labels saying "TOS 1.4 (c) USA." In the near future, Atari will be shipping TOS 1.4 on MASK ROMs and, at this time, it is not known if "RAINBOW" will appear on those chips.

Second, the official "default system date" of TOS 1.4 is 4-6-89, not 4-16-89 as we were originally told.

Finally, we were able to contact Innovative Concepts (IC) and have determined that they had no part in our dealer's pirating of TOS. The chips IC has been supplying to other local dealers were legitimate and purchased from BEST Electronics, who in turn got them straight from Atari. Our dealer finally admitted, to us and to Atari, that he was burning the chips himself. By the way, Innovative Concepts has just announced they will do TOS 1.4 upgrades to any ST/Mega for only $125, including the cost of shipping your computer back to you, insurance and a disk of utilities. IC will also replace the marginal 74LS373 chips in the 2-chip TOS Megas with 74AS373 chips for only $25 when installing TOS 1.4. Give IC a call at (313) 293-0730.

We would also like to extend a very special THANKS to the folks at Atari for helping us out with this whole situation, especially John Townsend, Antonio Salerno and Gayle Johnson. Those new, official TOS 1.4 ROMs in our machines are super!

'Tis the Season

To all the folks at Atari, we wish you a wonderful holiday and a VERY successful new year. After all, if Atari doesn't have a successful 1990 in the U.S., there are going to be Atari developers, dealers and users who won't have a very merry Christmas next year.

To all the 8bit and ST/Mega hardware and software developers, thank you for your support through what was, from most reports, a very tough year for Atari developers. Without the great third-party support we've seen for our machines this year, we doubt there'd be much of an Atari community left. If Atari puts their new developer support plan, as announced at COMDEX, into place AND begins a serious push in the U.S. market, then 1990 should be a great year for developers and users alike. If not....

And, finally, to our participating user groups -- and Atari user groups everywhere -- we wish you all the happiest of holidays, and may Santa leave a Stacy laptop under each and every Christmas tree!

Bill & Pattie Rayl

REQUIRES at least 1 meg. of RAM

(or a Megadisk or Polydisk Cartridge)

- Imagine Saving almost any game at any point, then being able to return there as many times as you like.
- Imagine the Ultimate Back-up Utility that actually UNPROTECTS programs as it copies them. Lets protected programs be stored as files, run from a hard disk or even be transmitted over a modem.
- Imagine saving three or more protected single sided disks on just one double sided disk.
- Imagine Instantly switching back and forth between two different programs, games, utilities or business applications.

Now Stop Imagining and get Switch/Back.
It can do all this and more.

Switch/Back is a revolutionary new hardware and software package that lets you get more from your ST, MUCH MORE.

Switch/Backs gaming features lets you instantly save most games then continue playing. If you get in trouble you can switch back to where you were as many times as you like.

BACK-UPS –Switch/Back can work with your favorite back-up program and allow you to save whole protected disks to files for archival purposes. It can also automatically unprotect a program and save it as standard file. This method works on hundreds of ST programs and it allows you to run the files directly. Its perfect for running protected programs off a hard disk. It creates standard TOS files, that can be stored together on disks or even transferred by modem.

SWAP – Switch back lets you load just about any two programs into your ST and switch instantly between them. It works with games, business programs, utilities, compilers, etc. Although only one program is running at a time, the other is available instantly, right where you left off.

The Switch/Back hardware plugs into your printer port for easy use (It has a pass through connection for your printer too.)

Switch/Back requires at least One Meg of memory (Or a Polydisk or Megadisk) **ONLY $69.95**

ST Protection Techniques

Finally ST Copy protection techniques are revealed. This complete book and disk package details the state of the art in ST Protection methods and much, much more.

The Software included with the book provides many powerful features like the AUTOMATIC PROGRAM PROTECTOR. This easy to use Utility allows you to protect just about any ST program. You can choose a combination of protection methods like encryption, checking custom disk formats, password protection or a limited use option that makes the program self-destruct after running a preset number of times.

The book includes topics such as Phreaking, Logic Bombs, Hardware data keys, the legal aspects of piracy and software protection, Custom disk formats, Pirate Bulletin boards and much more.

In addition it contains reviews of the popular ST back-up programs and detailed explanations of ST disks and drives.

ST Protection Techniques (Book and disk package) **Only $39.95**

Digisound ST

High Quality sound digitizer for the ST. This powerful hardware and software package lets you sample real world sounds and play them back on any Atari ST. Add special effects like Echo, Reverse, looping, pitch manipulation, mixing and envelope control. Turns your Atari keyboard into a musical instrument to play songs with your digitized sounds (also works with any MIDI keyboard). Digisound makes it simple to add sound to your own program, too! Unleash the incredible sounds in your ST with DIGISOUND. Supports sampling from 5 to 40Khz, DIGISOUND is the choice of the professionals. DIGISOUND was used to create the voice in Chessmaster 2000, and other commercial programs. **ONLY $89.95**

DIGISOUND PROFESSIONAL

All the excellent features of DIGISOUND plus these great extras

LOGARITHMIC SAMPLING – Special hardware extends the sound quality far above the other ST sound digitizers. Logarithmic sampling and playback (external amplifiers only) greatly extends the dynamic range while reducing distortion and noise.

Internal Real Time Mixing – Input from a stereo and a microphone so you can sing over a tape.

$149.95

Beat Box

Is it a Drum Machine? A sequencer? A new concept in digital sound? The answer is - YES!! It's all this - and so much more!! It's a polyphonic song construction set that turns your ST into a drum machine and digital sequencer. Now anyone can be a master composer. No musical knowlege required!

Just point and click to create facinating drum, voice, or musical patterns in four voices. Combine and arrange patterns to form complete musical compositions. Play the sounds, patterns and songs through your montior speaker or digitizer hardware.

You don't need a digitizer to enjoy Beat Box. It comes with over 35 ready to use digitized sounds. Or you can use your own sounds recorded with a Digisound ST, Professional, or other digitizer.

Beat Box $29.95

COLOR COMPUTEREYES™

Incredible COLOR video digitizer. • The first and only full color digitizer for the ST. • Uses standard video inputs like video camera, VCR, or video disk. • Works in all ST resolutions, Low res provides 16 shade black and white or full color pictures. • Pictures can be used with Degas, Neochrome, Powerprint and others. • Automatic calibration of contrast, brightness and white balance. • Plugs into cartridge port for easy set-up. • Capture your picture or that of your favorite star. **ONLY $199.95**

SPECIAL OFFER – Buy both Computereyes and Powerprint and SAVE 20.00 from the total.

PowerPrint ST

BLOW YOURSELF UP

Imagine your picture on a 6 foot poster. Create a business graph that can cover a wall. Quality output for posters, t-shirts, news letters, and more.

POWERPRINT

Whether it's a photo digitized with ComputerEyes, a masterpiece created with Degas, or the winning screen from your favorite game, POWERPRINT can print it with unequaled clarity and resolution. PowerPrint supports **ALL** ST resolutions. It prints multiple sizes up to **GIANT WALL SIZED POSTERS.** Print 16 shades for incredible detail. Print the whole screen or **ZOOM** in on just the part you want. POWERPRINT offers unique effects, including rotate, mirror and inverse options. Selective shading option allows you to print multi-color pictures on any printer by printing one color at a time (using color ribbons). Powerprint lets you capture and print almost any ST screen. Works with Star, NEC, Citoh, Gemini, EPSON, XM8048 and compatible printers.

Only $39.95

DIGISPEC

DIGISPEC is an exciting new breakthrough in computer video digitizing. **DIGISPEC** works with your Color ComputerEyes to create **spectacular 512 color** video images. Now you can capture and display video pictures in unsurpassed detail and clarity, with 512 different colors on your ST screen.

DIGISPEC is easy to use. It works on any ST computer. Simply capture an image with your Color ComputerEyes and color video camera (or VCR, video disk, etc.). Then run **DIGISPEC,** and watch as your picture appears in a full rainbow of 512 true colors.

DIGISPEC includes a special shading feature to give you even more detail and color. The shading feature uses a technique called dithering, which creates and displays images in 3,375 or even 24,389 simulated colors.

DIGISPEC creates detailed, low resolution video images on any Atari ST, color video camera (or VCR), and Color ComputerEyes. Every Color ComputerEyes needs DIGISPEC! **Only $39.95**

Polydisk Polydisk is a 512K version of a Megadisk. Polydisk gives you the same fast boot features, the high speed access, and the print spooler. Polydisk has a power supply (like Megadisk) but does not contain a battery back-up.

Note: Those with only 512K of main memory can use Switch/Back with a Polydisk, just like those with one Meg.

Polydisk (512K Solid state drive) **Only $199.95**
(Clock option card is also available for Polydisk $29.95)

ATARI

Atari Bulletin Board

by Bill and Pattie Rayl

Atari Corp News

There has been a bit of activity in the Atari world in the past month. November means COMDEX, and there was lots of news coming out of that computer dealer event. Also, back at Atari Headquarters, things were happening.

As the Door Turns

The newly appointed President of Atari Computer, Mike Moran, has left for "greener pastures" at Sega in the past month. As we write this, no person has been named to replace him.

Federated Buyers?

Atari has also been looking for a buyer of its electronic gadgets store chain, Federated. The Los Angeles Times, on Nov. 9th, reported Silo, Inc, a subsidiary of Dixon's in Great Britian, has offered to purchase the 21 Federated stores in Southern California. Apparently, the other stores may be purchased by Fretter, although noone at Atari was commenting officially to the LA Times.

"Analysts said Federated was the victim of several problems: its own poor marketing efforts and limited product selection, aggressive price cutting from Circuit City and Adray's, and a continuing absence of hot new electronic gadgets to lure customers into its stores.

"At the time, Atari Chairman Jack Tramiel said the deal was part of his overall strategy of building an international electronics company that would handle everthing from computer chips to finished goods. But a year after the purchase, Atari sued, Wilfred Scwartz, the founder and former cheif executive of Federated, and several of its finacial advisers for overstating the company's assets. Atari claimed it would not have bought the chain if it had known its true financial condition." — The Los Angeles Times

Third Quarter Lo$$

Atari announced a loss of $5.4 million over the third quarter of 1989, and despite the bad news, Atari stock stayed around the $10 per share mark. Part of the reason the stock may be staying up is because of the Portfolio and Atari's showing at COMDEX.

COMDEX News

COMDEX was held in Las Vegas, Nevada from Nov. 13 to 17th, and while the reports were mixed at first, the consensus is very positive. The only "new" hardware Atari was showing was a multi-rez monitor to accompany the TT.

Atari had five TTs on display (actually running software available now on the ST), a handful of Stacy laptops with 4Megs RAM and 40Meg hard drives (one in the capable hands of David Small) and a large number of Portfolios. Atari even had a number of Portfolios "networked" together and sharing the same printer. WordFlair and DeskSet II were demonstrated.

Next to the Atari 286 IBM-compatible machine was a RAMcard drive to transfer data back and forth between the PC and the Portfolio. Apparently, a few COMDEX-goers were shown a 512K version of the Portfolio, but no word was available on when these may hit the market and what their price might be.

Portfolio's a Smash Hit

The Portfolio, by all reports, was the hit of the show, with many dealers talking to Atari salespeople about carrying it. Our understanding is that dealers don't have to take the whole Atari line to carry the Portfolio, although they are greatly encouraged to do so.

We heard reports of 100 new dealers being signed up at COMDEX, but we hope to get confirmation on the exact number from Atari executives by next month's issue. For more information on the show, please see the article later in this magazine.

Developer Party Report

Sam Tramiel was reported as saying Atari plans to drop the retail price of the ST to $399 and production is gearing up for a big push. To accompany such a push, should one happen, Atari has restructured its developer support.

Now, a registered developer with Atari has access to their dealer list, list of registered owners of Atari hardware and the list of registered User Groups. These lists are planned to be updated quarterly.

In exchange, Atari is asking all developers to re-affirm their "registered developer" status, either through a letter or phone call to Atari Corp. Atari also is asking developers to ship them three copies of their software, crippled in some manner to not be fully usable, and a selfrunning demo of that software. This program, called Soft Source, will allow dealers to get a CD-ROM of the software programs, complete with demos so even a novice can professionally demonstrate and sell sophisticated software.

Developer News

CMI, the producers of a 16mHz upgrade board with math coprocessor and blitter sockets for the ST, has gone out of business after offering excellent deals recently on their boards. Another developer, Quantum MicroSystems, Inc (QMI) has reportedly gone under. QMI produced ST Talk Professional terminal package and DeskCart hardware clock and buffer cartridge for the ST. John Demar, QMI's founder, is reportedly now doing contract work.

Analog and ST-Log are no more. The December issue was the final issue of those Atari specific publications. Clayton Walnum has said he'll continue editing/writing for Larry Flint's Computer Games & Entertainment magazine.

On a bright note, Soft-Logik Publishing is shipping the new release of PageStream, version 1.8. Dealers can upgrade owners of PageStream for no charge, but you may wish to call ahead to give your dealer plenty of time to get through to Soft-Logik to check on your registration.

Commercial Software Ships with Virus

The first set of disks Soft-Logik sent out carried a "key" virus on the program disk, but Soft-Logik is assuring everyone they are not distributing the virus any longer.

Electronic Arts reported their release of Star Command has a virus present on the disk. The announcement stated that a virus killer program can kill this virus, or you can call (800) 448-8822 to find out how to return your disks for a "clean" version. According to George Woodside, author of VKiller, this one is also the insidious "key" virus.

Update News

ISD, Inc is currently shipping out their tutorial and index for Calamus users.

IB Computers has an update to the software for their IB 5.25" drive for STs with TOS 1.4. Owners of IB drives can obtain a free update by calling IB directly. IB Computers can be reached at (503) 297-8425.

Bargain Hunters Heaven

American Design Components has some good deals on "discontinued" Atari 8bit hardware. For instance, you can purchase an 800XL for $49, new! New 1200XLs are selling for $59, and Percom Drives are selling for $79.95 DS and $59.50. [Note: Some people report that, though the $79.95 Percom is capable of DS/DD, they have received drives with SS/DD mechanisms from American Design Components. Ask before you buy!] For more information, call (800) 776-3700.

Online News

In a recent conference on GEnie, Atari wizards Dave Small and Jim Allen began a "market survey" to judge if ST/Mega owners would be interested in a 68030 upgrade for their machines. Dave Small has requested that anyone who wants to cast a vote should do so in the Gadgets Rountable on GEnie, the GBS area of the CompuServe ATARIVEN forum or via US Mail. Please, do not call GBS as they are filling Spectre GCR orders!

A new Programming and Tech Help conference is starting up on CompuServe each Friday night at 10 PM Eastern in the Atari Pro Forum. Join David Ramsden (Antic Software), Robert Birmingham (ST Log contributor) and a host of others as they answer questions and trade source code/programming secrets. All levels of programmers are encouraged to attend!

Those Were the Days, Paul -- We Thought They'd Never End!

by Gordon Totty (MACE)

But, alas, end they did.

In the November '89 AIM, Paul Stampfli of El Paso presented a very thoughtful piece on the virtue of small computer user groups (see The Right Brain, page 6). Our beloved editors thought that a MACE member, remembering when that distinguished body had 2,000 family memberships, might have a different perspective on the "giant club" situation.

I was there. I think about it fairly often. I miss it. It's gone, and the fault is not with MACE.

I joined MACE in January, 1985. I became member number 2,266. Up to that point in time the club had grown by leaps and bounds from its start in January, 1981. There were about 20 members at the start, and by October, 1981 there were already several hundred members.

Mystery fans, take note: MACE celebrates its birthday in June. In the June, 1985 issue, the fifth birthday was noted. That same issue included an article titled, "The Good Old Days". In it, the first president of MACE described its birth in January, 1981. That would make the fifth birthday January, 1986. Go figure. I can't.

Now, through the miracles of your imagination and the twin arts (two of the Three Rs) that truly separate us from the lower life forms, I will attempt to bring you back to our past. (Music, please; the Jack Tramiel Overture, perhaps.)

Let us return now to those days of yester-year, as out of the past comes the thundering hoof beats of several hundred Atarians stomping into the Great Hall of the Southfield Civic Center for our monthly meeting. The Michigan Atari Computer Enthusiasts ride again! Hi, ho Eight Bits! Whoa! Steady, big fellow.

When I arrived, the "big fellow" was Kirk Revitzer, President. I had been fooling around with a model 400 with the membrane keyboard and a 410 recorder. Ah, tape storage. High tech, you know. Just like the big computer installations. Ha! I needed a lot of help and reassurance, and I got it at MACE, even though I was just another face in a crowd of hundreds.

Kirk is remembered by me as running the best Q&A sessions that the club ever had. He opened every meeting with it, using a microphone and about 50 feet of line, and he couldn't even get halfway back into the audience. His knowledge was amazing. Any question that he could not answer he would throw to the crowd ("crowd," not group) and there was always somebody to answer it.

In fairness to our other officers since Kirk, I should mention that they have all tried to stimulate questions. For some reason, however, the questions that used to be numerous are now few. Perhaps, instead of being inhibited by the large crowd, we enjoyed anonymity in it and that made us bolder. The group is now "cozier," but noone (myself included) seems to want to ask questions. We can't all have achieved expertise, so what's gone wrong? I think the main problem is that hardly any new users exist.

Meetings, in general, were noisy and poorly controlled. We were a happy mob, all talking at once. One reason is that, just as was pointed out in Paul Stampfli's article, most of us could not see the demos clearly enough, even with the use of a projection TV. We could sit way down front to see. Or, like most of us, we could sit near the back and gab. I tried both, often in the same meeting.

One memorable night that we all shoved forward, straining to see, was the first time an ST was demonstrated. Awesome!

We were so big we had a store at our meetings. MACE member Jim Steinbrecher, owner of Sector One International, set up shop in the back of the hall for every meeting for years. He sold hardware, software, parts, books, diskettes and magazines. Tape, too. If there was nothing else going on, one could look at Jim's display and maybe make a purchase. Or, just talk to Jim. I am sure that Jim was fully capable of answering all of the questions that Kirk handled.

MACE had members in South America, Australia and even Toledo, Ohio. Our elections included multiple candidates for each office, and MACE had ten elected officers back then. Candidates even made speeches on election night. Today, an election night speech is more apt to be, "Gosh, doesn't anyone want to run against me? I'll do it if no one else wants to."

Blessings on our officers. We need them now more than we ever did before if we are to survive. Someday we may have an election with no candidates and it will be all over.

The main thing that separates then and now, at least for me, was the feeling of belonging to something big, important and secure. MACE did not look like it would ever crumble or decay. Today, for me personally, membership means that I am in a group that is too small, too fragile and too insecure.

In 1985, I thought MACE would never end. (Those were the days, my friend.) Sadly, in 1989 I worry about whether or not the end is near. Size is important. It is a significant indicator of strength and health.

Atari success, MACE membership and my shopping experiences are all related. Ponder these facts. I bought my Atari 400 from Sears, Roebuck and Co. — still (I think) the largest retail sales chain in the world. They don't carry Atari anymore.

Next, I bought an 800XL at K-Mart (I was waiting for the 1450XLD, but that's another story). I think that K-Mart is the second largest retail sales chain in the world, although others are gaining fast. They don't carry Atari anymore.

Moving up for more power without the price, I bought a 130XE from United Computer, a small, single-outlet, local computer store. They have gone out of business now, along with many other small independents.

Golly, that ST demo at MACE was impressive. I had to have one, at last. I bought a 1040ST by mail order. Local stores were out of stock or couldn't get them. I didn't want to wait. Subsequently, Atari withheld stock from the mail order houses to give it to Federated. What happened to Federated, folks?

Since then, Electronics Boutique, Babbage's and Software, Etc. have all dropped Atari from their shelves. Adding insult to injury, so have our local Children's Palace and Toys 'R Us stores. You can get software for your IBM or clone at Toys 'R Us.

Makes one feel good, doesn't it?

We no longer have a store at our meetings. We may still count our paid membership in hundreds, but our meeting attendance is now regularly measured in tens.

We're still at the Southfield Civic Center, but not in the Great Hall. I've noticed fashionable exercise groups in there (you can't sweat right unless you look right) and even a fencing club one night. MACE no longer needs nor can afford the space. We're in the small room in the back, and our officers are looking for something less expensive.

In the good old days, the editor of the MACE Journal (it's gone, too) had an enormous job. I started writing in the June, 1985 issue. It had 46 pages and was supported by one club. AIM runs about 35 (excellent) pages, and is supported by 15 clubs, at last count. Don't misread my intention. I am not criticizing or attempting to belittle AIM. It is a great magazine, destined to be even greater (watch out, Current Notes!). I am only trying to measure the size of the early MACE editor's job for you. My first editor, Ann McBain Ezzel, was driven bonkers by the task. She "retired" talking to herself.

Perhaps the reason I feel the sense of loss and regret that I do, together with the fear of the future, is that I came into a big group and watched it dwindle. I keep thinking of all the great people who meant so much to us who don't come around anymore. Sure, we have great people now! But where are all the others?

Furthermore, it isn't just our club that is declining. It seems to be the entire Atari community in the United States. I have never regretted buying my Atari computers. They have all given me great enjoyment. I want it to continue. I don't want to join the owners of the Coleco Adam, the Timex Sinclair, and the Texas Instruments...what was it anyway, the TI99-4A?

Paul Stampfli is in a small group. He wrote of "learning, and growing and making friends along the way." He concluded, "Kinda sounds like life, doesn't it?"

I've had my share of learning, but the pace is slowed. Lots and lots of friends, but lots less now. Shrinking, not growing, everywhere I look. Is this what death is like?

I've seen both sides, big and small. Bigger is better. It was more fun.

According to Paul Stampfli, El Paso is hot, sunny, and brown. Well, Michigan is grey and cold. Winter is coming home. I envy you, Paul. Enjoy, and hope it lasts.

Now, if I have made any MACE member cry, I'm sorry. Remember, it's always darkest before the dawn. So, put on a happy face. Smile, darn ya, smile! Let a smile be your umbrella. Just direct your feet to the sunny(vale?) side of the street. Somewhere, over the rainbow, bluebirds fly. Who knows, Atari may yet return to the American market. It ain't over till it's over!

Don't feel like you belong to that Borneo tribe that "worships" a WWII plane replica in hopes that GI Joe will come again to drop packages of goodies from the sky. Golly gee, Annie, it ain't that hopeless. Cross your fingers when you wish upon a star. I just heard a rumor of a big U.S. sales blitz from the latest bozo.....

SOME LIKE IT... HOT!

The CodeHeads announce:

HOT WIRE + MAXI FILE

- "When the START editorial staff first saw HotWire, our collective reaction was 'Wow!'"
- By far the **fastest, easiest way to run programs** on the Atari ST...from a floppy disk or from a hard drive!
- Build menus for all your most commonly-used programs. Load new menus with a single keypress or mouse click!
- New **Ledger** function records time spent in programs of your choice.
- **Passwords** may be used to restrict unauthorized access to certain programs.
- New **on-screen clock**, appears in the programs that you choose
- Unlike other shells, HotWire works correctly with all programs, just like the GEM desktop.
- A **seamless interface** offers direct access to MultiDesk and MaxiFile

- Full-featured file-handling utility lets you **move/copy/delete/rename/touch/lock/hide** any combination of files and/or folders.
- Runs as a desk accessory or as a program in any resolution.
- Incorporates every file/disk feature of the GEM desktop plus much more.
- **Intelligent disk copying** routines.
- **Rename folders** - Print directory listings
- **Store comments** about any file/folder.
- Unique and intuitive user interface designed for easy, speedy operation.
- **Customizable** for your style of use.
- **Keyboard equivalents** for all operations.
- Quickly select from up to 20 of your most-used paths.
- Even runs programs and loads documents.

Here's what our users are saying about HotWire and MaxiFile:

"The HotWire/MaxiFile combo has **changed the way I use my ST.**"
"I haven't used the standard GEM desktop in weeks."
"Without HotWire and MaxiFile I'd be totally lost on the ST."
"...a tribute to **assembly excellence**." - "MaxiFile is **a wonder!**"
"HotWire and MaxiFile **really** 'beat up on the competition'!!"
"...you'll need to package it in asbestos because it is too **hot**."
"**AWESOME!**" - "Super!" - "a veritable software gem!"

HotWire Plus (includes MaxiFile)	$49.95
MaxiFile	$24.95
HotWire	$39.95
G+Plus - a replacement for Atari GDOS	$34.95
MultiDesk - load unlimited desk accessories	$29.95
CodeHead Utilities - a collection of useful programs	$29.95
MIDIMax - a powerful MIDI tool for performers	$49.95

Phone: (213) 386-5735. Visa, Mastercard, AmEx accepted. Shipping charge: US $2, Canada $3, Europe $5. CA residents add 6.5% sales tax.

COMDEX Fall 1989 -- WOW!

by Ralph Mariano (STJAUG)

This article originally appeared in issue #114 of ST Report and has been reprinted by permission.

The list of exhibiting developers was like a who's who register in the Atari community.

Atari's executive representation was excellent, lead by Jack Tramiel (the founder) and his sons, Sam and Leonard, along with Antonio Salerno, Mel Stephens, Charles Cherry and almost everyone I know, either from online or through my dealings with the company. I did, however, have the distinct pleasure of meeting most all the folks for the first time, and believe me, they were indeed warm and friendly at all times.

Portfolio Interest

The Portfolio was clearly the hit of the Atari display. Sure the TT was there...but, in sheer numbers, Portfolio ran away with the show with the number of folks coming into the Atari booth specifically to "see" the Portfolio. The stats say Atari sold approximately 123,000 Portfolio units to date and there is no end in sight.

Please, keep in mind my friends, the Portfolio may be the best thing to ever happen to Atari... "Why?" you ask. Easy, the game image is slowly going down the tubes. How do you spell relief? Portfolio.

Showing off Deskset II

Atari Corp. had Deskset II on display and in the capable hands of Elizabeth Shook. Admittedly, after Miss Shook gave a demonstration of DeskSet II, it certainly appears to have a number of first rate, redeeming values. DeskSet II is designed as a typography modification system as opposed to a DTP program. Contrary to preliminary reports it deserves a second look.

Atari Developers

The third party developers who were setup in the Atari area put on quite a show for all attendees. The "NEW" goodies to be seen were simply dazzling to the senses, for example, the 19" Multi-Rez monitor in use in the Pagestream (Soft-Logik) cubicle. The STe, TT, Mega File 44, Stacy, Portfolio, Moniterm 19" monitors, SIMM Expansions, T16 16mHz upgrades and more were all being shown.

Developers in attendance at the Atari site included:

- STart & Antic - Jim Chapperal
- Gadgets by Small - Dave & Sandy Small and Doug Wheeler
- Fast Technology - Jim Allen
- JRI (John Russell Innovations) - John Russell
- Soft-Logik Publishing - Mike and Deron Kazmaier and Mark
- ISD - Nathan Potechin and Julius Oklamcak
- Migraph - Liz Mitchell
- Abacus
- Michtron - George Miller
- Blue Chip Software - Lauren Sellers
- Soft-Aware - Richard Skraly
- Dr. T's
- Video Touch
- Word Perfect - Reed Hainsworth

Getting the most attention was, without a doubt, the Portfolio. Many individuals from the MS-DOS world who had never considered an Atari as a serious computer source were deliberately seeking out the Atari display to examine the Portfolio.

Naturally, they *had* to see all the other 'neat' goodies running in the Atari area. Most were, by their own admissions, "quite impressed" with the performance of the Atari computer line.

News on the TT

The TT model uses the 68030 CPU and supports 5 resolutions on one multisync monitor and has built-in support for the Moniterm and other big screen monitors. TTs were in use in several cubicles and represented itself quite well. ISD was running DYNACADD on a TT along with a plotter — very impressive.

There were however, a number of Mega STs running the T16 16mHz enhancement as well, and they looked comparable to the TT in many ways. I saw "clones" of my system in use and was pleased to see that others felt the same as I. I chose to build up my Mega4 with a Moniterm and T16 enhancement.

The STe

The STe has two additional ports on the left forward side and are for the new joysticks. On the back are 2 RCA jacks for stereophonic output. The STe was set up displaying games. Since it was using the extended color palette, stereo sound and the light gun, it now looks like a serious contender in the entertainment arena.

The Stacy

My favorite, the Stacy (ST laptop) also had a prominent position of display here, one was in the very capable hands of GBS (Gadgets by Small), demonstrating the Apple Macintosh emulator, Spectre GCR.

Another Stacy was at the Blue Chip Software cubicle with Lauren Sellers doing the honors demonstrating Word Flair. The other units were in the MIDI areas, and justifiably so, as they seemed to fit right in.

Since Stacy has passed the FCC type acceptance tests, it won't be long now...perhaps by mid-December. [Ed.: We could not obtain confirmation from Atari that the Stacy has passed FCC approval.]

Moniterm monitors were quite numerous. The performance of these beauties is nothing short of spectacular. I found that the major stumbling block for most programs is a simple fix to the video call. One must use VDI instead of getrez — then the big screen is free to "do its thing." The Moniterm was in use en masse in nearly all the developer's cubicles.

The Atari reception was well put together, and the revelation of highly increased developer support through a totally revamped program was indeed a welcome announcement. Atari's goals, as far as I am concerned, are well within reason for 1990. [Ed.: for more info on this, see Atari Bulletin Board elsewhere in this issue.]

Mr. Gordon Monnier introduced this reporter to Leonard Tramiel early on in the evening, and from that time forward, the delights of the evening went strictly uphill. In fact, I found Leonard to be quite charming and very willing to discuss the future of Atari.

As the evening wore on, Leonard invited me to accompany him as he 'made the rounds' of the reception. I got to meet John Townsend and Ken Badertscher. I must say, both young men were very impressive. Atari has an excellent staff assembled and should become quite a competitor in the coming months.

A very pleasant surprise came later in the evening when I found John Eidsvoog playing one of my favorite styles of music, progressive jazz. Folks...John is not good...he is a great musician.

Ron Luks, CompuServe Atari Forum Manager: "I got the feeling that Sam's got his company under control. He's got his group set up, and they're actually starting to deliver and doing it in a low key manner."

Bob Brodie, Atari User Group Coordinator: "I really enjoyed developers coming up to the TT and trying it out. The new Editor of STart, Tom Byron, came by, saw the TT and said 'Let's see how well you maintained downward compatibility' and whipped out a Start magazine and disk. He booted up RezRender and tried it. What would take RezRender hours to do on the ST was taking only minutes or moments on the TT. Daren Kazmaier came by, and we nicknamed PageStream 'PageScream' because it was really flying on the TT."

The Reviews Are In!

"... If you own a hard drive ... then RUN, don't walk, to your nearest Atari dealer and ask him to order DIAMOND BACK from Data Innovations, Inc."

Victor T. Albino, ST World

"...The overall winner has got to be Diamond Back...it creates GEM compatible disks at image backup speeds...This is the one I use, and I use it a lot. It's Dependable!"

LeRoy Valley & Ron Robinson, ST Informer

DIAMOND BACK is packed with features, from its custom format/verify routines, to its use of script files, it's in a class by its self. Here are just a few of the features packed into DIAMOND BACK: • EASY to use completely GEM interface and online help • File compression & encryption • Selectable incremental backup, by date or archive bit (using TOS 1.4) • Load/Save backup configurations • Automatic drive switching • Backup/Restore any number of drive partitions, directory paths, single directories, or even specific files or types of files • Recreate the original tree structure or specify a new directory structure during restore.

Feature for Feature, DIAMOND BACK offers the hard drive owner, more POWER and FLEXIBILITY than any other backup program currently available for the Atari ST/Mega computers.

FULL COUNT BASEBALL & COURT SIDE COLLEGE BASSKETBALL

Full Count Baseball & Court Side College Basketball are games for the true sports lovers in the family. Both are statisticly based simulations, which we believe offer the sports fan the most accurate statistical game play of any sports simulation for Atari computers. Full Count comes with teams from the most recent season plus 52 great old time teams and Court Side includes 286 teams from the most recent season plus 70 all-time great college teams.

Diamond Back, Full Count Baseball and Court Side College Basketball, are Available NOW. Retail price for Diamond Back is $39.95, sports games retail for $39.99 (each). Dealer inquires welcome.

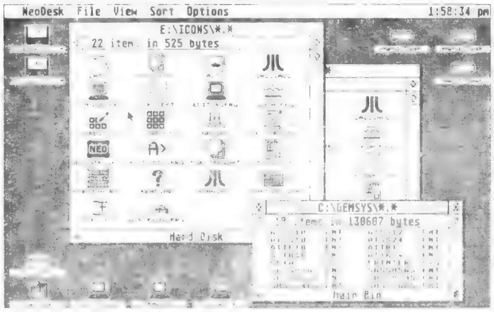
NeoDesk 2.0

The Desktop Alternative



Icon & text displays not available at the same time

The Ultimate Upgrade for the Atari ST!!

NeoDesk is a complete replacement for the built-in GEM desktop. Its hundreds of features are clearly documented in an 85+ page illustrated manual. Once you try NeoDesk you will never want to use the old desktop again!

Features Include: High-speed file and disk operations (no more multiple disk swaps!) * Unique custom file icons for any file (includes icon editor) * Place commonly used file icons right on the desktop * Run these from the mouse or keyboard (hot keys) * Twenty character editable disk volume name * Replacement control panel with corner clock and screen saver * Printer queue * Keyboard equivalents for all commands * Mono & color support * Improved disk formatting * Enhanced install application (This one works!) * File templates * 25%-30% faster windows * Requires less than 21K of RAM * Place a picture on the desktop * Multiple desktops * Many more!

For Only $49.95

GRIBNIF SOFTWARE

Orders only: (800) 999-GRIB * Inquiries: (413) 584-7887
Fax: (413) 584-2565 * P.O. Box 350 * Hadley, MA 01035

DOES YOUR KID THINK THE ST IS A *GAME* MACHINE?

Kidpublisher *Professional*

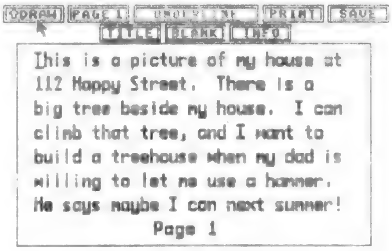
A Desktop Publishing Program for Young Writers

Kidpublisher ***Professional*** represents a major enhancement of D.A. Brumleve's freely-distributed *careware* program, **Kidpublisher**. Version 6.0 has been completely rewritten to bring your child:

- an automatically-loaded font set (4 sets included)
- a faster word processor with word wrap, an underline option, and movement of the text cursor with mouse or arrow keys
- a greatly-expanded drawing program with features such as LINE, CIRCLE, BOX, FILL, and the all-important UNDO
- a title page option which automatically centers your title, author, and illustrator
- many minor additions and improvements

Kidpublisher ***Professional*** lets your child (ages 5-11) write and illustrate professional-looking books and other documents. The kidfriendly features you've come to expect from the author's ***kidprgs*** series combine to make this program accessible to the youngest of writers. To order your child's copy, see your dealer or send a check for US$25 to:

D.A. BRUMLEVE
P.O. Box 4195
Urbana, IL 61801-8820



This is a picture of my house at 112 Happy Street. There is a big tree beside my house. I can climb that tree, and I want to build a treehouse when my dad is willing to let me use a hammer. He says maybe I can next summer!

Page 1

Kidpublisher ***Professional's*** typing screen is shown above. Five pages of text and graphics are automatically loaded with the program. Each printed page has a picture at the top and text below

REQUIRES COLOR MONITOR
Printer must accept an ST screen dump.

Demo version available for $5.

Dealer inquiries welcome.

Turbo-Info #6
Determining the System Configuration

by Chuck Steinman (DataQue)

This article will present one way to set up a program to run under the Turbo-OS, yet still be compatible with the Atari XL/XE operating system. It is assumed that the reader has some knowledge of programming at the assembly language level. This installment will concentrate on the allocation of RAM.

To make memory management a bit easier for the programmer, the Turbo-OS features several different routines to control memory allocation and de-allocation. There are no such routines in the Atari OS, other than memory is allocated by the operating system for its own use. There are memory locations to indicate the lowest and highest available RAM locations. These pointers are modified by the application program rather than the OS.

When I set forth to write the Turbo-OS, I determined that there were four types of memory that I would support. To maintain compatibility with current programs, there was a limit to what could be done with standard memory, since current applications would not be calling my routines. The same would apply to the extended RAM, which is banked in the $4000-$7fff range using the PORTB register of the PIA. The nature of the various types of RAM were discussed in an earlier AIM issue.

There have been a few people tell me there is no need for any memory management on the Atari 8-bit computers. If an application needs RAM, it just uses it, and when the program terminates, another program can use it. Well, that presents problems when more than one program has to share memory. This happens quite often despite what you may think. If you boot a disk operating system into your computer, and then an application program, you would have two programs resident. There are many times when there are incompatibilities between application programs and particular DOS versions. DOS 2.x compatibles are usually the worst.

Having to load in DUP.SYS is a major trauma. If there is a program in memory you want to preserve, you have to have a MEM.SAV file on the disk. This allows you to save part of your program to disk, enough to load DUP.SYS into RAM. But then, if you happen to want to copy a file, you are just out of luck. You either have to corrupt your program or copy a sector at a time. This all happens, even though there probably is at least 16K of RAM being wasted under the OS ROM. RAMDisks were a fudge to help this problem, automatically protecting the resident program would have been a better solution.

Yeah, I know, all of you SpartaDOS users are grinning from ear-to-ear about now. Well, there are problems there also. Lets say my program wants to use the RAM under the OS, or one of the extended (XE type) banks? Can I jump in and use them? No, but not only that, I have no way to determine if that RAM is being used. There may be 4 to 16 banks of 16K just sitting there...or SpartaDOS may be using part of them as a RAMdisk. But how does the application program know? It cannot, since there is no means provided to indicate what banks are available and how many banks there were to start with.

Well, I hope you can see my point. Programs should be written to be more dynamic. If the RAM under the OS is used, then look for banked RAM. If that is already used, or not available, then ask the user what he wants to do. Not just "Hey bud, can I overwrite your valuable data?" but give the guy the option to save the data, move it or destroy it. I know, I know, why do you need this type of sophistication in a game machine?

This is where the Turbo-OS routines jump in. If you have an application that needs four banks of extended RAM, you make the Talloc call specifying you need four banks. Those four banks, if available, will be flagged as used, so that other programs will not use them. If there are not four banks available, then a bitmap of all free banks is returned. A similar procedure is followed by the extended and explicit RAM types.

Enough talk. I am sure you programmer types want to see some code fly by your tired eyes about this time. Well, I will present a code segment which will determine whether there is a Turbo-OS (and Turbo-816) installed, and what memory is available. Better buckle up, here we go!

Chuck Steinman's 8bit assembly source code starts on the following page.

```
; first some memory locations need to be defined.
basebyte   dsb 1            ; memory base address

NEED SPEED?
RELY ON TURBO ST!

Turbo ST turns your Atari ST into a speed demon. Check out **Turbo ST** at your local dealer or download our free demo from your favorite bulletin board.

Upgrades to version 1.8 are only $5 with your original disk. For more information, call (407) 657-4611, or write to SofTrek, P.O. Box 5257, Winter Park, FL 32793.

ST Bashing: The Story Continues...

by Tim Holt (ST of El Paso)

I walked into Jenkins' Computers yesterday, and there on the counter was a nice display for a new contest being held by Accolade. You remember Accolade; they make Test Drive, among other ST software.

Well, I thought, I am always ready for a free trip, or for Ed McMahon to come knocking on my door, so I scooped up some entry forms. Let's see, this was the "Life in the Fast Lane" contest. Hmm...sounded good. What could I win?

According to the entry form, I could win a choice of prizes. Sounded good so far. I could win:

- A Grand Prix Motorcycle Weekend in Laguna Seca, Ca.
- An Indy Car Grand Prix Weekend
- An Offshore Powerboat Weekend

WOW! Nifty prizes! No purchase neccessary! (Even better, since I still owe Jenkins' money...) Ok, I fill out the "Official Entry Form." It asked the standard questions — name, address, city, etc. Then, down there at the bottom I am asked to check which computer I have.

Let's see, the ones listed are: Apple II series, Apple IIGS, Commodore 64/128, Commodore Amiga, IBM/Tandy Compatibles and Macintosh. Where is the ST? It isn't listed! Not even an "Other" catagory!

My blood begins to boil. Tom, the co-owner of Jenkins' looks at me. "Don't you hate it when they do that?" I responded yes. I could really feel for him. Here he is, expected to display the contest thingy, and it doesn't even make mention of the type of computer that he sells. It makes a potential customer think that the STs or Megas aren't even considered game machines!

Geez! We have hit a pretty low point when the ST line of computers aren't even considered game machines! I could understand if I owned a VIC-20 or a Timex-Sinclair, machines that are no longer made. But Accolade still makes games for the ST! And the ST is STILL being made! What is the problem?

I believe this is a symptom of a larger disease. There have been other "contests" where the ST was relegated to the area of "Other Computer" or no mention was made at all. This was just the latest in a long line. Just because we have been slighted by Accolade this time, doesn't make them the only guilty party.

Ok Holt, you talked a lot, now what do think we should do? Well, there are several things that you can do: (These are by no means the only things we can do, but since the revolution is nonviolent, bombing Accolade is prohibited by several Federal Laws.)

1. Enter the "Life in the Fast Lane Contest." You do not need an official entry form, just a 3x5 card that contains the following information: Name, Address, City, State, Zip, Name of Retail outlet where you get software, City and State of that store, and most importantly: type of Computer owned.

Mail your entry form to:
Accolade
Life in the Fast Lane Sweepstakes
PO Box 8973,
Westport, CT. 06888

Entries must be in by March 15, 1990. Again, be sure you state you have an Atari computer. (Who knows, your "protest" might win you a prize!)

2. The second thing you can do is write to Accolade and demand to know why your computer was neglected. Do not write to the above address because that is just a company that handles sweepstakes processing. They couldn't care less what type of computer you have. You can reach Accolade writing to the following address:

Accolade Software
Office of the President
550 South Winchester Blvd.
San Jose, CA. 95128 (408)-296-8400

If you call them, also write. Calls mean nothing unless there are millions (something that won't happen), but letters begin to pile up and make a mess in someone's office.

3. Next time you are in contact with an Atari official (be sure he or she is one that will have a job there next week) ask them why they don't have better contacts with the software houses. One little box on an entry form is free advertising! Or, you might want to write the big cheeses at Atari. The address is:

Atari Corp.
Office of the President
1196 Borregas
Sunnyvale, CA. 94086
(408)-745-2367

It has become apparent that the big wigs at our favorite computer company really don't care what happens outside in the real world to us little users.

If we want any kind of action to take place in our favor, we better do it ourselves. Write, write, write! Or we will become parents of cute, but abandoned, orphans.

Go ahead.

SPEED
LIMIT
8MHz

Punch it.

For the ATARI 520ST, 1040ST, MEGA and STACY.

Step a generation ahead with **TURBO16** by Fast Technology. The **TURBO16** accelerator can move your ST into high gear. Upgrade your ST and achieve *up to double the speed* in some applications.

Take Your ST Past Its Limits.

TURBO16 will *dramatically* increase your desktop performance. Complex illustrating and page layout is no longer a *drag, click and wait*. **TURBO16** will increase your ST's speed from 8MHz to a *blazing* 16MHz. A state-of-the-art 16MHz processor and 32k high-speed cache memory add the power that lets you *soar*. **TURBO16** is fully compatible with standard ST software, including *Spectre 128* and *pc-ditto*, and **TURBO16** makes games *fly*. **TURBO16** has a far greater effect on productivity than a hard disk, and at **$299 suggested list**, a far lesser effect on your wallet.

Easy To Install, Easy To Use.

TURBO16's installation requires only the removal and replacement of your ST's 8MHz 68000 chip, and connection to the ST's MMU chip 16MHz clock. That's it! The low profile package will not interfere with other upgrades, and **TURBO16**'s special features optimize your ST's operations. **TURBO16**'s speed can be controlled by way of an optional, dealer-supplied hardware switch, auto folder program or desk accessory. Take full advantage of your ST's power with **TURBO16**. See your Atari dealer today, or contact Fast Technology.

TURBO16 is a trademark of Fast Technology. **Atari** is a registered trademark and **ST**, **520ST**, **1040ST**, **MEGA** and **STACY** are trademarks of Atari Corp. **Spectre 128** is a trademark of Gadgets by Small, Inc. **pc-ditto** is a trademark of Avant-Garde Systems.

We won't tell.

In Your Drive

by Chet Cox (ACD)

"Hey, kids! What time is it?!"

"It's In Your Drive #24 Time!"

Well, so this is what it feels like to appear in AIM! After having to "hold back" and restrain myself in STart and Antic, it's gonna feel good to be able to really cut loose!

Since we're trying to see how much (or how little) space we should take up in AIM, we'll have a short IYD this month. But in that shortness, let's make sure we cover all types of our Ataris!

That Portfolio

First on the agenda is the Portfolio. After getting my hands on this little $400 wonder, I have to say that those people who refuse to consider it (Because it is sold by Atari) are cutting their own throats. Yes, even more so than when they ignore the ST or the XE! Because the Portfolio, though limited, is the most portable full-blown computer around, and the only decent alternative can run $2000.

Not that it's for everyone. The only people who really need the Portfolio are those who have to do much of their work "in the field." A contractor, for instance, is using one to be able to change parameters on the building (and on the costs) as things are discovered, or as new costs are determined.

A writer would be able to jot down notes, then turn them into the finished product after feeding the words into a home machine. Similarly, a student could take notes on the Portfolio, feed those notes into an ST's word processor, then expand those notes into a complete term paper — much more quickly than using handwritten notes and retyping from those handwritten notes. The terminal software included makes it simple to transfer to a home computer or to log onto a BBS or another computer via phone modem.

Quite simply, the Portfolio does not offer quality, finished work. It uses a simple text editor, a Lotus-type spreadsheet and a quickie database to do rough work and to save time. Time is, more than ever, more valuable than money. For around $500 (Portfolio + cable + pseudodisk), hundreds of hours can be saved in a single year. Now, Where's that STacy?!

A Flawed Gem

Diamond Write fails to live up to the promise of itself, its parent Diamond environment or the past achievements of programmer Alan Reeve. These are hard words for me to write, for Alan's work in the past has been innovative, useful, and brilliantly executed. His weaknesses (inadequate documentation and an inability to use different DOSes with his products) were far outshined by his considerable strengths as a programmer filling the needs of a hungry Atari populace.

Diamond Write promises much, and could be forgiven for falling short if it did even some of what it claimed. However, it not only is slow (almost forgivable), but can't perform many of the on-screen functions, even when all the prompts insist that such and such a function has been performed.

For instance, you try to "rubber band" a block of text. This performs well, up to a point. Holding the mouse button down (or a joystick button, or a touch tablet button...Diamond can be configured to use an ST mouse, an XE mouse, a joystick or a touch tablet) while moving the mouse will create an expandable box which wraps around a block of text. The text is supposed to then be shaded, so you'll know it's marked. You may then delete, move or insert that block...in theory.

In actuality, the text doesn't become shaded, nor can you delete, move or insert that block of text. The pull-down menu bars will say you have done so, and will give you every prompt as if you did. But, NOTHING HAPPENS! This goes on with every feature. You can't get out of the 40 column mode! You can't change the margins! It's infuriating to see Diamond Write ALMOST succeed in each task, only to fall just short. It almost does everything, but succeeds in hardly anything.

If Diamond Write succeeded at getting print from the screen to the printed page (ARRGH! You can't always get it to print to the printer either!), in any shape or form, it would still be worthwhile. Its ability to use and manipulate fonts is unequalled in the 8bit Atari world, and it has a real "What You See is What You Get" screen.

But, it does no good to be able to see on-screen what you want if you can't get it to the printer! It's inconceivable to me that this program comes from the creator of News Station, Publisher Pro and Diamond!

Perhaps Alan Reeve suffers from that age-old soap opera malady and is being impersonated by an evil twin?

Silly Japanese Cartoon Giant Robot vs Godzilla

If you got a chuckle from the above title, if you've gotten a laugh and a good time from bad Japanese monster movies, AND if you've enjoyed the "un-science" of Robotech, Battletech or Transformers, you'll get a real kick out of a mindless game of Razrats.

Wargamers who play hugely complex historical simulations occasionally enjoy a simple, purely-for-fun game. These games, called "beer and pretzels games," offer a chance to just play around without worrying about historical accuracy, scientific plausability or internal logic.

Razrats is an old-timey beer and pretzels game of the best variety. Don't go looking for a great deal of internal logic. You command up to four "razrats" (giant robots, or bug robots, or something) which can carry grenades, lasers, and torpedoes -- in addition to armor. These razrats are then dropped onto a planet which resembles a checkerboard with terrain features. Your razrats then jump around, throw grenades at, fire lasers at, shoot torpedoes at, and jump on your opponents. Fun and destruction, and don't ask questions such as "Why are these razrats shooting at each other?" or "What's the point of this battle?"

After all, how can you take these razrats seriously? You've named your team something like "Hokum's Razors" and you've named your razrats things like "Moe," "Crusher Boy," or "Stomper." And you've chosen razrats shaped like amoebas or red teardrops.

Strategy? Mostly guesswork. High grasses protect, somewhat, from lasers and impacts. High ground means you can toss grenades farther, but you're a better target. You program an entire turn's moves at once, and movement then occurs AFTER everyone has programmed their razrats. A lot of ammunition gets wasted, shooting where your opponent *was* or where you think they *might* be. One to three players can play. Three is best. Even better when you've tipped a few drinks!

Too bad this is only for the ST (and only in color)! It'd make one dynamite game for the XE and XEGS!

The Best Things in Life are Free (Almost!)

Sigh. We have to admit that the supply of useful 8bit software is drying up. It's been a long time since the days of SynFile+, PaperClip and A Financial Wizard! Yet we have new products appearing on disk that rival the best of the old days, and sometimes surpasses the material for other 8bit computers people are paying big bucks for!

They're right there in your favorite Atari magazines. Antic, which is troublingly kicked to bi-monthly status, just included one of the best financial programs on its monthly disk.

"Budgetizer" covers one of the problems which many financial programs never address. You have expenses which you must meet once or twice a year, such as taxes, insurance, or car tags. Those expenses can come to a big hunk of bucks all at once. "Budgetizer" takes your annual, semi-annual, whatever expenses, then will break them down into monthly increments to let you know how much you need to "put aside" each month to meet the final expense. It's easier to put a couple of bucks to the side each month than to come up with the whole thing at once.

That same issue (October 1989) also includes a directory program from BASIC, a BASIC speed-up tool, a quick "Capture the flag" game, three text adventures (each quite good!) and a VERY strange jump-and-climb arcade game. All these for one magazine+disk —$9.95 off the rack, or $4.67 by subscription.

ANALOG, which has re-absorbed ST-Log, is jam-packed with goodies this time. A Concentration game, a title screen maker, some BASIC utilities (memory resident) and a BASIC tutorial round out this disk. (ST users should enjoy this too! The ST disk features a GFA BASIC tutorial, a Family Feud game, a virus killer, and a great animated Christmas tree to decorate.) Its price ranges from $13 on the stands to $6.59 by subscription.

[Ed. Notes: ANALOG/ST-Log will no longer be published after the Dec. 1989 issue]

Well, I did promise to keep this short, and look at how long I've let it become. Let's call it quits until next time, when we'll be able to mention Monitor Master, some more about Hillsfar, some material for the XEGS and the old 2600 and 7800 machines too. Until next time, never wiggle your fuji in public!

The ToadFile 44

The first LOW PRICED Removable Cartridge Hard Disk Drive!

We at Toad Computers wonder why good technology always has to mean high prices and long waits. We have the Toadfile 44 **now**, available in varying configurations with fixed drives up to 129 megabytes, while other companies are still telling you to wait. We also have **the lowest price** available. We use the same drive Atari™ will be using in their drive, and compatible cartridges will be available at your Atari™ dealer, or through us. Finally, the capacity of a hard disk with the convenience of a floppy. Only from the leaders! Toad Computers.

ToadFile 44 - ONLY $899!

Basic unit includes drive, one 44 megabyte cartridge, case, power supply, fan, ICD™ host adapter, clock, formatting and partitioning software, and a 3' DMA cable. Please specify an under-the-monitor case or a shoebox style case. Both may hold two 5.25" or 3.5" drives. Extra 44 MB cartridges are $99 when purchased with drive, or $109 later.

ToadFile 44 *Variations*

ToadFile 94 *(44 MB Cartridge + 50 MB Drive 40ms time)*	$1279
ToadFile 109 *(44 MB Cartridge + 65 MB Drive 40ms time)*	$1309
ToadFile 129X *(44 MB Cartridge + 85 MB Drive 28 ms time)*	$1399
ToadFile 88X *(2 44 MB Cartridge Drives & Carts, 25 ms time)*	$1549
ToadFile 44S *(44 MB Cartridge Drive, Case, Power & SCSI In)*	$799
ToadFile 44D *(44 MB Cartridge Drive Only, No Power or Case)*	$699

Toad *Hard Disk Drives*

Toad 30 *Drive 40 ms Access Time 3.5" Mechanism*	$539
Toad 50 *Drive 40 ms Access Time 3.5" Mechanism*	$599
Toad 85 *Drive 28 ms Access Time 5.25" Mechanism*	$709
Toad 100 *Drive 40 ms Access Time 2 3.5" Mechanisms*	$899
Toad 170 *Drive 28 ms Access Time 2 5.25" Mechanisms*	$1399

TOAD COMPUTERS

556 Baltimore Annapolis Blvd.,Severna Park, MD 21146

These prices reflect a 4% discount for money orders, certified, or personal checks. We accept Visa, MC, and Discover. MD residents add 5% sales tax. Please call if you have further questions!

FREE SHIPPING!!

For 520ST, 1040ST, 520STfm and MEGA

MEMORY:

Expand your St's memory to ONE Megabyte, TWO and ONE-HALF Megabytes or even FOUR Megabytes with tech-specialities plug-in memory modules. All memory boards fit under the R/F shield. The CPU is completely available for any future enhancements (blitter, coprocessors, PC-emulators, speedup kits etc.). No soldering is required.

520ST modules use 256K DRAMs for upgrades to 1 MB and 1 Megabit DIPs for 2-1/2 and 4 MB upgrades. All boards are fully socketed and the expandable boards can be configured for either 256K or 1 Mb chips. This means that you can start by upgrading your 520 to one Megabyte and later move up to either 2.5 or even 4 Megabytes--the maximum for any ST, even the Mega! Installation is completely solder-free. Comes with detailed illustrated instructions and a one (1) year limited warranty.

	expandable boards:	
520A	Socketed, no RAM	$129.
520B	1 MB, socketed	$179.
520C	2.5 MB, socketed	$395.
520D	4MB	$545.
	non-expandable boards:	
520-2	Socketed, no RAM	$79.
520-1	upgrades to 1 MB	$149.

Upgrade your 1040ST or 520STfm just as easily!

Send us your 520STfm and we will upgrade it to ONE Megabyte by installing a second bank of memory, easily removable in case you want to upgrade again. Complete with installation for only $149 plus shipping.

Or install one of our 1040 (fits 520STfm too) memory boards and upgrade your ST to 2-1/2 or even 4 Megabytes. There are nowadays four (4) different versions of the 1040/520 motherboards around. If you bought your ST less than 2 years ago, you need to check your machine, detailed info in our catalog.

Version "0" fits all 'old style" 1040/520 with 6 ROM chips under the power supply. Limited space above the 1040 mother board prohibits the use of conventional sockets in one bank. Optional "ZERO Height" sockets allow you to have this bank socketed too, so you can plug in or exchange 1 Mbit chips. The "ZERO-Height" socket kit is also available separately so you can install it at any time!

1040A	1 Bank sockets, no RAM	$110.
1040B	Fully socketed, no RAM	$149.
1040C	2.5 MB + 1 bank sockets	$365
1040D	4 MB, 32 1 Mb DRAM installed	$565.

Version "1" fits all 1040/520 with the memory chips under the power supply. Available room prohibited the use of "DIP" packaged chips. The main board is only 6.4" x 2.9" and needs "ZIP" packaged 1 Mb x 1 DRAM. It fits in the area under the power supply with the shield installed and stays 0.5" away from the CPU to allow attachment of other upgrades. More details in our catalog!

1040A1	no sockets, no RAM	$110.
1040B1A	1 bank socketed, no RAM	$149.
1040B1	completely socketed, no RAM	$189.
1040C1	2.5 MB, no sockets	$334.
1040C1A	2 MB installed, 2nd bank socketed	$365.00
1040D1	4 MB installed	$495.

Upgrades for version "2" of the 1040/520 motherboard should be available in a month!

All upgrades can be equipped with a Clock Option on the Memory Board, comes with software, only $30. Stand-alone CLOCK, please specify 520/1040 and your version of the motherboard $38.

EXPANDABLE Hard Drive Kits

come complete with software and all parts needed to get the system operational, 1 year ltd. warranty. There are right now three different case styles available:

1. Tower Type, 10" wide x 6.8" high x 15" deep, if sitting on your desk with monitor on top , with full SCSI interface and 'DMA-through'

-150 W PC power supply w/fan

-room for up to 5 half height hard drives or combination full/half height

-mounts on floor, under desk or on desktop

-can power up 520ST and external floppy drives.

-optional delay circuit for CPU allows fully automatic power-up!

T0S	No Drive, install your own emb. SCSI drive	$265.
T0	No Drive, MFM controller	$299.
T0R	No Drive, RLL controller	$475.

Complete with drive mechanism:

10 MB	$485.	20 MB	$565.	30 MB	$695.
40 MB	$745	64 MB	$795	85 MB	$895.

2. Monitor Style, 13.25" wide (same as MEGA) x 15" deep x 3.8" high with single port host adapter

-ready for up to three 1/2 ht or 1 each full/half ht. hard/tape/floppy drives

-55 W power supply with 115V fan

-can be placed under monitor or at side of your desk

M0S	No Drive, install your own emb. SCSI drive	$179.
M0	No Drive, MFM controller	$295.
M0R	No Drive, RLL controller	$365.

Complete with drive mechanism:

10 MB	$395.	20 MB	$495.	30 MB	$545.
40 MB	$685.	49 MB	*$625.	64 MB	$795.
85 MB	*$795.				

3. Desktop Style, 4.5" wide x 6" high x 13" deep with single port host adapter

-ready for 2 1/2 height or 1 full height drive

-55 W power supply

-optional fan available (add $18)

D0S	No Drive, install your own emb. SCSI drive	$149.
D0	No Drive, MFM controller	$279.
D0R	No Drive, RLL controller	$349.

10 MB	$355.	20 MB	$475.	30 MB	$525.
40 MB	$695	49 MB	*$595.	64 MB	$725.
85 MB	*$745.				

ATARI MEGAFILE:

Replace the 20 MB drive in your MEGAFILE 20 with a 42 MB 40 ms autoparking drive. Comes with a 1 year warranty on the drive mechanism. Exchange price including installation with your drive in good condition: $260., $369. outright.

Gain 65 MB of high speed (22ms av., 5 ms track to track) storage. Exchange with installation: $360., outright $449.

SUPRA 20/30 and ASTRA 20 MB:

Upgrade to 49 MB high speed storage with auto parking, 500 K/s transfer rate. With installation and transfer of your existing files: $379.

Host adapter cards are separately available and come with software and DMA cable or additionally with case and 6' round shielded SCSI cable with embedded power supply lines. Prices after the "/" are for version with case and cable. 1 port $79/119 full SCSI $119/159

CPU CASES:

Upgrade 520/1040 to the MEGA standard.

- Separate CPU and keyboard, gain space for three each 3.5"/5.25" floppy, hard or tape drives in two separate drive bays. Full height drives will also fit.
- A 150 W power supply with fan provides power for all possible combinations and keeps everything cool
- Reset button on keyboard
- A delay circuit allows fully automatic HD power-up.
- Monitor can be switched on/off with CPU, using an optional cable.
- Our kit uses a steel case 18" wide x 12" deep x 8" high, easily strong enough to support a high resolution monitor.
- The original keyboard gets a low profile enclosure, 18.7" wide x 7" deep x 2" high, consisting of a metal bottom part and the modified plastic top of the original case, supplied as exchange or you do the modification your self. The kit comes preassembled and installs without soldering. All mounting kits, wire harnesses and connectors to modify a standard machine are included.

Complete kit, please specify your machine type $295

OPTIONS:

Hard Drive kits for the CPU case consist of host adapter/controller with support bracket if necessary, DC harness and control cabling and might also be used with customer supplied case/power supplies. Kits with controller cards come with connections to two 5.25" drives. Kits for embedded SCSI drives come with one SCSI connector. Additional connectors $8. installed.

C0S	No Drive, install your own emb. SCSI drive	$99.
C0	No Drive, MFM controller	
C0R	No Drive, RLL controller	$299.

20 MB	$415.	30 MB	$465.	40 MB	$595.
49 MB	*$525.	64 MB	$725.	85 MB	*$685.

Cable sets to connect additional 3.5"/5.25" floppies also available, please see catalog.

KEYBOARD KITS:

We noticed quite a lot of interest for our keyboard parts used in the CPU CASE. Keyboard kits consisting of metal bottom case, connecting cable with reset and modified plastic tops on an exchange basis are available separately for $69., please specify your machine type.

Space limitations don't allow a more detailed descriptions. For complete 20 page catalog contact:

tech-specialities Co.
909 Crosstimbers
Houston, TX 77022
(713)691-4527/8
FAX: (713)691-7009

We ship COD ($3) or prepaid (5% discount), sorry no credit cards! Add the following amounts for shipping and handling:

memory upgrades and host adapters, 1st unit $5, add. units	$2
Hard Drive kits/CPU cases without drive	$10/$20
with drive - special shock resistant packaging needed	$20/30

Texas residents and willcall customers add 8% state sales tax.

Above prices are correct on 10-20-89. Prices with a "*" are PREPAY SPECIALS, no further discount available.

Mini MIDI Lessons # 1

by Morris G. Miller (El Paso)

Almost everyone has a natural curiosity about MIDI, whether or not there are serious intentions of using it. In this series of mini lessons on MIDI, I will attempt to answer some of the more common questions about it. We will discuss:

What is MIDI? What do I need for MIDI? Do I need to know music to use MIDI? What is a sequencer? What are the differences in keyboards? What does MIDI cost? Why should I do MIDI?

It is almost impossible to discuss music or MIDI without using some of the technical terms of the trade. In this series of studies we will try to say everything in such a way that anyone can understand it. A glossary will be presented to help with the words which may remain in doubt. [Ed: The glossary will appear as the last two installments of this series.]

What is MIDI?

MIDI is an acronym for "Musical Instrument Digital Interface." It is a defined means for interconnecting musical instruments and other related equipment for the reproduction of music. It now includes your computer and the programs for MIDI, keyboards, synthesizers and samplers, sequencers, recorders, editors, librarians, scorers and a host of other equipment and functions.

MIDI is the electrical and physical specifications for these interconnections. It forms the "standards."

The MIDI standards define the hardware connections and wiring to connect and send signals between the instruments, such that one can control or inform the other of musical events. The send wire of one connects to the receive of the other, and vice versa.

Signals are sent in serial, much like the serial printer or modem connection on your computer — one wire to send, one wire to receive. On some computers, the MIDI interface plugs into the serial modem port of the computer. On others, the MIDI port is built in as a separate interface.

The serial pulses sent between instruments are organized into 8-bit codes. The MIDI standard defines the meaning of these codes so that all instruments speak the same code language. Not all instruments respond to all the codes defined, but those that respond to any one code all respond in the same manner.

Electronically, MIDI also defines the current and voltage limits of the pulses and the bit rate for the pulses. In this there are now two standards, but any instrument designed for the faster standard will respond properly to the original, slower standard unless it specifically so states. Not to worry. For what you and I are doing, either of these are sufficient.

The MIDI connections on your instruments are 5-pin DIN. There are three kinds:

MIDI IN -- the instrument can receive MIDI code.

MIDI OUT -- the instrument can send MIDI code.

MIDI THRU — the instrument can repeat to the next instrument what was received on MIDI IN.

Not all instruments will have all three ports. This is a clue to how that instrument can fit into the MIDI hookup.

The full definitions for MIDI codes are available from many sources and will not be repeated here. Codes are defined for turning each note on and off, the note attack (how hard the key is struck), touch pressure (how hard the key is held down), release (how quickly the key is released), patch changes (selecting the voice to play), pedal control (sustain, soft, etc.), glissando and portamento (glide between notes), modulation (vibrato or tremolo) and others.

Codes are also defined for the individual manufacturer's, called exclusive codes. This allows each manufacturer to have special codes for the control of functions on a keyboard that is different from all other keyboards. It is this "feature" that will prompt you to make some decisions about the type of keyboard to use and the programs to buy before sinking a lot of money into it. The two must work together.

Note that MIDI does *not send the sound* of the notes played. MIDI sends signals to indicate what the *performer did.* MIDI sends codes to indicate which key(s) was pressed, when it was pressed, when it was released, which control was operated and how much it was operated. When played back from the computer, the keys are pressed again exactly the same as before, and the same controls are operated again exactly the same way. Reminiscent of a player piano, no? Only it doesn't have to be a piano. It might be two horns and a banjo. That's neeeet!

What Do I Need for MIDI?

Coming from a computer user this question relates to "what do I need to add in order to use MIDI?" Selecting your computer is another subject, but there are MIDI connections for almost every computer now made. As a matter of fact, many MIDI instruments can be used without a "computer" and have their own computer functions built into them. Many keyboards can record and play back the songs played on them.

For your computer to send a song to the keyboard you will need a sequencer or player program. There are some simple player programs and a few decent sequencers and editors available in the public domain. Commercially available programs are much better, but you pay for what you get. Another lesson will go into more detail about sequencers and editors. Basically, the sequencer will allow you to record a song as you play it, edit mistakes and make musical performance changes, select the voices and play the song back to the synthesizer.

Some computers have plug in card slots. MIDI interface cards are available for MAC, IBM-PC, Apple and others. Synthesizer cards are available for MAC and IBM-PC. If your computer does not have a MIDI interface built in, Apple makes a simple interface to plug into a serial port, but programs to drive it may be a problem.

Synthesizers can be purchased without keyboards. All keyboards have synthesizers in them. It is the keyboard which sends the performance signals to the computer for recording. When played back from the computer it is the synthesizer which makes the voice sounds you hear. You can play any song to a synthesizer whether it has a keyboard or not. Therefore there are two factors involved:

(a) If you know you will seldom be entering notes or playing the keyboard, buy a keyboard looking for the best synthesizer. You'll save enough money on the cheaper keyboard to buy another synthesizer without a keyboard.

(b) Otherwise buy the best keyboard you can, with less regard to the quality of synthesizer it contains. Get a better synthesizer as a separate item.

You will need an amplifier and speaker system. Any good home music system will be great. Add to it an audio mixer for combining the sound output of two to four separate synthesizers and microphone inputs. Radio Shack has a reasonably good one at a modest price. If your music system has a cassette recorder in it, then all the better. Record your performances and take them with you. You don't have to buy everything at once. When an item is to become permanent to the system, then buy the best you think you can afford.

Do I Need to Know Music to Use MIDI?

Yes. And no. There's nothing like a definitive answer, but the proper answer depends on what you want to do with your MIDI system. It requires no knowledge of music to play pre-recorded songs. You can change the voices, tempo, attack (volume) and many other components of musical character and style having no knowledge of music. You can have someone else play a song while you record it and have no knowledge of music. You can even do a lot of editing to a song with no knowledge of music.

But, it does help.

If you have no knowledge of music, you will be pleasantly surprised how quickly you can learn what you need to know of the rudiments of music once you start entering a new song into an editor. Keep in mind that it is not necessary to "play" a song to enter it into an editor. There are at least a half dozen different ways to get music into a sequencer. Some are easier than others, but others are more suitable to the circumstances than some!

We are not talking about "composing" music or knowing all about chords and patterns. It will be necessary to learn the relative tonal positions of lines and spaces on the musical staffs. It will be necessary to learn what note shape has to do with time and duration. It will be necessary to recognize the markings in the time and key signature of a score.

All this should take about an hour of talking to your daughter, who has been taking those expensive piano lessons — and the next three days to enter your first two simple songs.

After that it's all downhill.

Pre-recorded songs can give hours (literally) of great pleasure by the nominal process of examining them in the edit buffer of the sequencer and finding for yourself what the affects are.

Have that daughter play the song while you record it — mistakes matter not. Play with the editor until all notes are like the score. This will quickly let you see for yourself how the notes correspond to position on the staff, how shape relates to duration and how the signature affects the individual note pitch — and how quickly 10 PM can arrive! Assign voices, adjust tempo, set the MIDI channel, set up the synth patches and presto! New song.

Yes, you will need to know some "music." You do not need to know music theory. What you need to know at a minimum, you can learn very quickly by doing. Just don't burst out singing too loud! Happy MIDI.

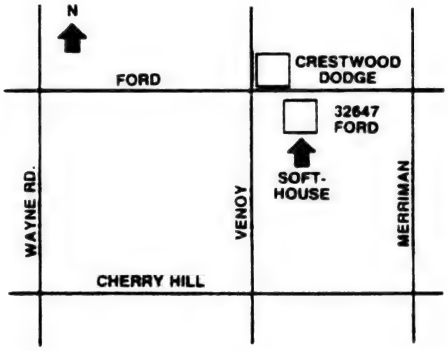
32647 Ford Rd.
Garden City, MI 48135
(313) 422-6760
1/2 blk. E. of Venoy



Soft House Computer Center has served the Metro Detroit area from this same location for over 4 years. We carry a complete line of software, accessories and books for the Atari ST, Commodore and IBM compatible computers as well as the entire product line of Atari ST hardware.

DISCOVER VISA MasterCard TeleCheck

Memory Upgrades

'Room to Maneuver!'

We can add memory to your ST, ranging from 1 Megabyte up to 4 Megabytes at your request. Call us for pricing information!

TOS v1.4 Upgrades

'Take the jump to Light Speed!'

We'll install and test this new version of the Operating System for only $99.95 plus tax and your old chips. Call us for more details!

Michigan's Largest Selection of ST Software!

ST Imports

'How the other half lives.'

We have over 90 titles in stock. The latest and the greatest; the tried and the true; and now Multi-Packs are available. Come take a look, you won't be disappointed!

Magazines

U.S.

Atari Interface Magazine, STart, Antic, ST Applications, ST Informer, Computer Play, Compute!'s Gazette

European

ST User, ST Format, ST Action, ST World, Computer & Video Games, The Games Machine

Software Rental Club

'Try it before you buy it!'

Save money by sampling our great selection of software before adding it to your permanent collection. Rental amount is deducted from shelf price if the software is purchased on return. One-year and Lifetime memberships available. Some restrictions apply.

We offer liberal trade-up credit toward the purchase of new computer systems. Call us for details!

Repairs

Authorized Repair Service Center

Expert Atari ST and Commodore repair service is available at reasonable rates. All service is done in-house to assure prompt return. All work is guaranteed.

One Stop Christmas Shopping:

Supra Hard Drive Systems
Panasonic Printers
Supra and Avatex Modems
Bulk Disks in a Variety of Colors
Disk Cases and Carriers
Cables and Connectors
Paper and Ribbons
Desks and Hutches

Computer User Spouse Strikes!

by Robert Hodson (El Paso)

After reading "NeoSTAG struck by Virus" in AIM, September 1989, it occurred to me that there is a virus out there that has struck all avid users.

Symptoms

Hearing the parts of sentences, such as...married to that computer...speaking to the wall...last time I'm calling you... and many, many more. Seeing a hand on the power switch after hours of work and hearing "SAVE IT or LOSE IT." Telling your spouse you'll be gone to the computer store/friend's house one or two hours and being gone for four or more.

It seems that if you're branded a computer enthusiast you will eventually be bitten with this sleeper. At first, I tried to find some kind of immunization for it.

Cures

Posting the following sign above my workstation worked for 48 hours only. This virus has no quick cure.

REMEMBER
COMPUTERS ARE NOT
WARM, LOVING, OR
UNDERSTANDING.
ONLY YOUR WIFE IS THERE
FOREVER!

After which, I would sense a presense akin to the grim reaper pointing to the sign.

Instantly save, shut down and say "Yes Honey, what do you need?" knowing that this time you did not even hear part of a sentence.

Next came getting up early Saturday and Sunday mornings, closing the bedroom door and putting a box over the printer (if absolutely needed).

One other short-time remedy is to have your spouse take a trip while you're attending a school — any school will do. This will be the only time you can get some kind of remission. Be forewarned, there is no permanent cure, only trying to work toward harmony. Beware!

Limited supply

1050s (reconditioned) **$165**

Koala Tablet replacement black membrane pads only $15 each

1010 Program Recorder $30

1050 Mother board $75

XF551 Disk drive owners – We now have the new **XE DSDD DOS** and Manual **$10**

Rana or **Indus GT** Drive Service Manuals **$35ea**

Indus Diagnostic Disk **$15**

XE Game Machine Owners want to know more about your built in **Basic** programming language, try these books: Atari Basic Learning by Using **$5,** 101 Programming Tips and Tricks **$5,** Inside Atari Basic **$6,** Kids on the Atari (a good book for Adults too) **$7**

Can't find the Synfile filing program any more? Try MPP **MicroFiler** progam (C) **$12**

Atari 1020 4 color 40 column **Printer/Plotter.** Don't be fooled by companies advertising units at lower prices! We **100% Test** all of our 1020 units and **Guarantee them 90 days. $20ea** (Great first printer for XE game machine)

For those of you who have bought 1020 Printers thru mail order and found them **bad!** try our **Replacement Mini gears** for the 1020 **$5** pair

Print Shop 1020 printer driver program (D) $14.95

3 ft I/O Cable Reg. $10 Sale $ 5 ea.

Wico 3 Way Joystick $15.95 or Black Max $8.95

Hofacker **ATMAS Editor and Macroassembler** (D) $24 or **Forth on the Atari** (D) $24

AtariWriter + Part V for Those Who Don't Want to Read the Book

by Jimmy Boyce (CACE)

Hi people! How's the old heater doing? Are we having fun yet in this cold? You say, "Who cares, just tell me how to create my own personal dictionary?" My, my...aren't we edgy?

Why a personal dictionary? Mainly because AW+'s dictionary is so small. Another reason is that you may have a specialized vocabulary. An electronics technicion, dentist, inventor or teacher of a special subject will each have need for a personal dictionary. If you have more than one specialized subject, you can make a dictionary for each subject.

There are two ways of going about this process. You can run a document through the spell check and then go back to menu and select FILE PERSONAL DICTIONARY or you can just create a list of words and save them.

Creating a Personal Dictionary using Corrected Words

So, let's see what is involved in saving words from a document that you have just checked for spelling <pg 57>. Keep in mind that as you are running a file through the Proofreader and you tell the computer to accept as correct a corrected word, that word is maintained in memory. When you are returned to the menu, press the key that gives you the File Personal Dictionary function in order to save this list of words (the list in memory).

At this point the computer will prompt you for a file name. I like PERDIC followed by a number, such as PERDIC1 or PERDIC2. This way, if you exceed the maximum allowed words (256 words per personal dictionary file), you still have continuity with the dictionary.

Now, insert a formatted disk (you know how to format a disk for AW+) into your drive and hit [RETURN]. If the file exists, you will be asked if you wish to replace the old file, if not press [N] and start over with a new name for your file.

Here is the nifty part of this whole rigamarole (that ought to mess up the Proofreader but good) -- you will be prompted with SELECT WHICH WORDS TO STORE? Y/N. If you select [Y], you can choose the words, letters, abbreviations and numbers that you wish to save. Each time a word flashes on the screen you will be asked if you wish to save it. Just type a [Y] or [N] to save or discard each word.

Now that you are done with the list, you are asked to press [RETURN] TO CONTINUE. I assume you can follow directions and you did indeed press [RETURN]. You will notice that your drive started running. Guess what? Your new personal dictionary is being saved.

Please remember that if your list is OVER 256 words long ONLY the first 256 words will be saved. If you have a list of over 256 words, save it as a regular AW+ file and split it up with the "saving a portion of a file" technique mentioned on <pg 28>. Then save it to your Dictionary disk (that will be discussed next).

If you type an [N] when asked SELECT WHICH WORDS TO STORE? Y/N, the entire list is saved and that is the end of the procedure.

Building a Dictionary Manually

Let's say that you already know that the technical terms you will be using are not in the AW+ dictionary, and you want to get a jump on things and create your own files without using the previous method. Here it is folks: first create a file containing all the specialized words you use. Your options are to create a column with a [RETURN] after each word or just type them with a space between each word. Then, just save this like you would any file but put it on your dictionary file disk with an appropriate file name. Isn't that just precious!

There are a few ground rules and they are quite simple to deal with. Start each word with a letter. Do not use punctuation marks, parentheses, or numbers at the beginning of a word. Proofreader will accept ['] in a contraction such as "he'll" or "aren't."

Do not enter contractions showing possession such as "she's." Also, remember that your dictionary can contain up to 256 words (130XE owners — your list can be up to 628 words).

Using a Personal Dictionary

Let's move on to proofreading with personal dictionary files <pg59>. Go to the main menu and gently depress the [V] key to verify the spelling of your document. Remember when it says to insert the program disk and press [RETURN], in reality it means leave the AW+ program disk in your drive because PROOFREADER is on that side of the disk.

When the PROOFREADER menu appears on the screen, you must gently strike the [A] key to add your personal dictionary. Now that was not too bad was it? Oh, I almost forgot...you must type in the name of your dictionary file (I use PERDIC1) at the prompt at the bottom of your screen and hit [RETURN]. This gets your part of the dictionary into memory so you can use it.

At this time, if you have another dictionary to load then do so, because you should be back at the menu with a notice telling you how many words you loaded last time and asking you to make another selection from the menu. Just repeat the process and the next list of words is loaded.

If you try to load more words than there is alloted memory space for, you will be told that you goofed with a terse little message saying MEMORY FULL — INCOMPLETE LOAD. However, if you have been fortunate and all has gone well, ask the computer to correct your spelling by depressing the [C] key and inserting the AW+ dictionary disk in your drive (don't try to jam that disk in without removing the other one first!).

Updating A Personal Dictionary

OK, you have corrected your sloppy spelling and keyboard work. Now let's update that dictionary disk. As a reminder <pg57>, each time that you correct the spelling of a word that is not on the regular dictionary disk, that word is saved in memory. These words can be added to your personal dictionary when you have completed your spell-checking in the following way: when you have completed spell-checking and have been returned to the Proofreader Menu, depress the [F] key for File Personal Dictionary and you will be asked for a filename.

At this point, let me tell you something I discovered about this process. For some reason if you save your dictionary file with the same filename as before, you will have a double list of your words in that file. So, here is what I do to eliminate the problem:

Step 1 Save the file with another name (e.g., PERDIC2 assuming that your original file was called PERDIC1.

Step 2 Delete the original file (PERDIC1).

Step 3 Reload PERDIC2.

Step 4 Save PERDIC2 with the new name PERDIC1.

Step 5 Delete PERDIC2.

This may sound a bit much, but it will leave your disk uncluttered. Plus, making it easier to load your dictionary next time, because you will not have to remember which file is which.

The next thing you will be asked is if you want to select the words you want to save. I always tell it [Y] just so I can eliminate anything I do not wish to have on the disk. One final note: save the file while in the Proofreader program because some of the 130XE's do not respond when returning to AW+ and your corrected file is lost upon re-booting AW+.

That's about the sum and substance of checking your spelling. Remember that your personal dictionary is limited to 256 words (for 130XE owners the limit is 628 words). That's it for now. Next month, we start printing the corrected file that you have just saved.

FA•ST

" ICD sells a superb, excellent, wonderful tape backup unit. I love mine, and it's saved me any number of times.. There's nothing else like this in the ST world; priceless and fast."
-Dave Small, Gadgets by Small

" Using the ICD Tape Backup was surprisingly simple and faster than imaginable. It was so fast that I doubted it was real." *-John Nagy, reviewer for Computer Shopper*

" The ICD FA•ST Tape system is a dream come true. The hardware works flawlessly, and the software is incredibly flexible and easy to use...it's simply the best way to back up your hard drive."
-Charles F. Johnson, Codehead Software

ICD has been backing up Atari users since 1984. With hard drives, host adapters, printer interfaces, and the new FA•ST Tape Backup, ICD offers you more! Call us for information on our products. **(815) 968-2228**

M.U.L.E. -- A Look at an 8bit Classic

by David Brzezinski (WAUG)

Imagine the joys of colonizing a new world. Then imagine the problems of producing food, energy and materials and competing with other pioneers for prime land and scarce supplies.

This is the basic concept of the game M.U.L.E. presented by Electronic Arts. This isn't a new game (it is copyrighted 1983), but I've found it to be one of my all-time favorites.

So what does M.U.L.E. offer? You are colonizing the planet Irata with three other characters. If you play alone, the computer plays the other three. If you use two joysticks, you and a friend can play against the computer. With a joystick and paddles, three people can play. This is the best I can do with my 130XE.

A friend who originally showed me this software has an Atari 800 with four joystick ports. With that, people can play all four characters, eliminating the computer from play, which prevents the all too common disappointment of having the computer win.

Play goes from six (beginner) to twelve (tournament) rounds. A lot happens in a round, so be sure to leave enough time to play it through. A land grant beginning each round allows players to choose a plot of land from a rectangular area to be developed.

M.U.L.E.s (Multiple Use Labor Elements) are bought at the store and outfitted to perform specific tasks such as farming, mining and energy production and placed on a piece of land. Since the colony must be self sufficient, food and energy become important as the store runs out. Smithore, produced by mining, is used to make more M.U.L.E.s.

Once every round, the players go to market with whatever they have produced. In this market, players are allowed to buy and sell to each other at any acceptable price, or sell to the store at a fixed price. If the store does not have a particular product, players are forced to purchase from their fellow players at whatever price is asked.

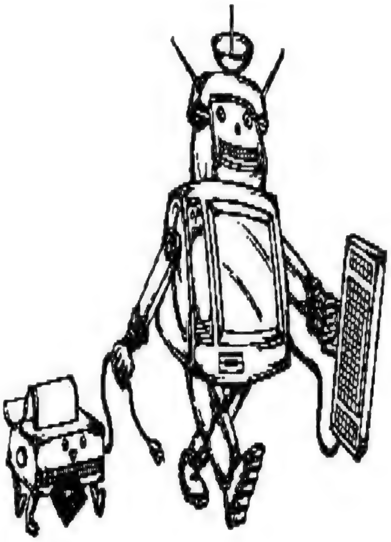
This market portion, cleverly done with graphics, takes up most of the time in the game, but offers the real opportunities for strategy. It is possible to corner the market in certain essential products and drive the price up to ridiculous levels before you sell.

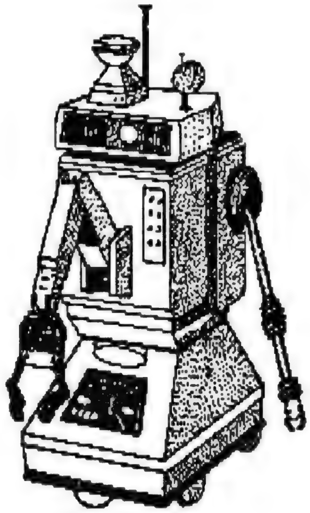
If you really get stuck or pull too far ahead of the pack, there is a whole range of good and bad things that occur to level things out again — from pirates to packages from home. There are natural disasters to shake things up too. And, to pick up a few extra bucks, you can always go Wampus hunting, if you can spare the time allowed during your round.

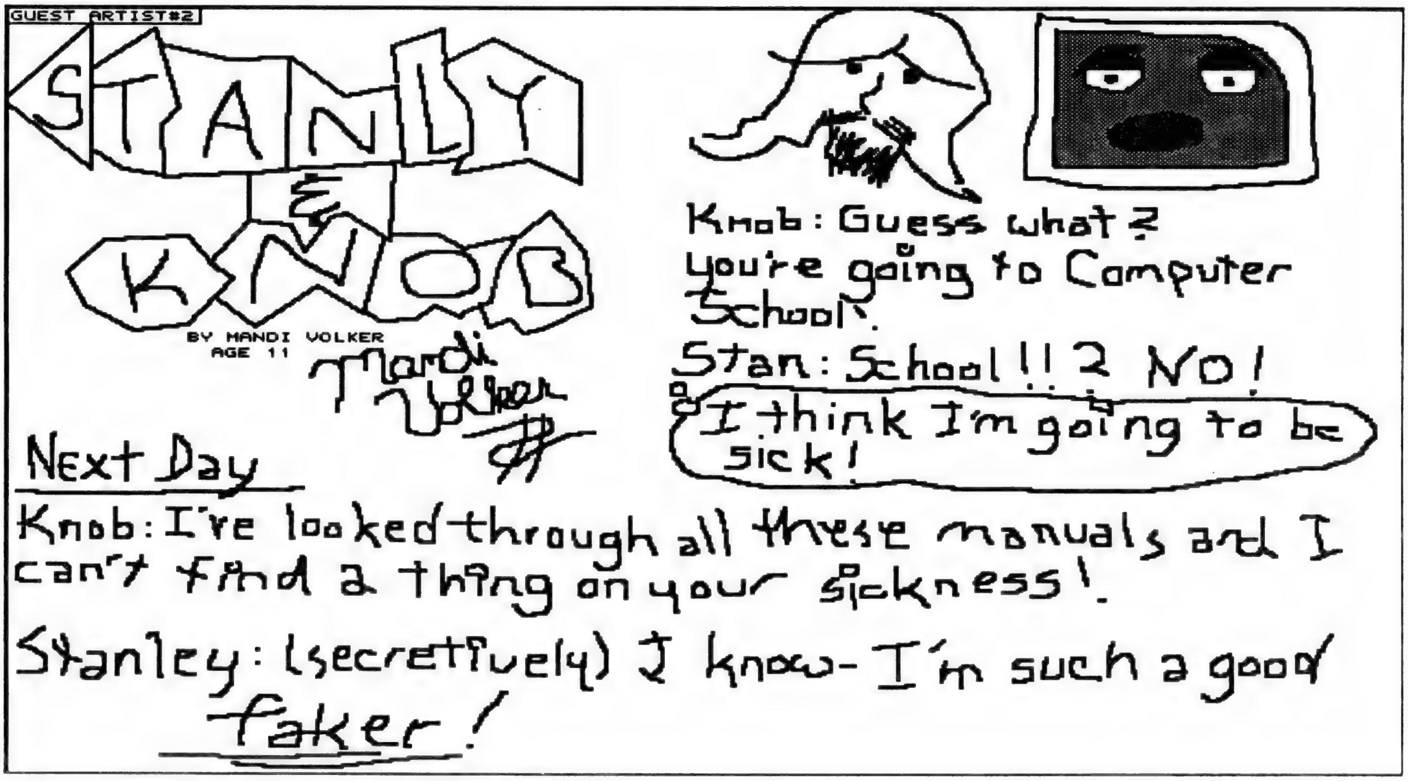
The point of the game is to become "First Founder," the wealthiest member of a successful colony. Surprisingly, the computer does very well, although I can usually beat it. My son, 10 years old, likes the game nearly as much as I do and doesn't seem to have any problems with the market aspects of the game.

The graphics and sounds are amusing and entertaining and the joystick manipulations are not overly trying. Don't try to play on a monochrome monitor, since just about everything is color coded.

All in all, I recommend this game to any 8-bit owner, especially you Atari 800 owners that can play all four characters. I really like the idea that the whole family can participate at once. I would hope that someone is working on Return of M.U.L.E. or something similar. I imagine it could even be a best-seller on the ST, if Electronic Arts would make an ST version. Anyone at EA listening?







GUEST ARTIST#2
STANLY & KNOB

Knob: Guess what? You're going to Computer School.
Stan: School!!? NO!
I think I'm going to be sick!
Next Day
Knob: I've looked through all these manuals and I can't find a thing on your sickness!
Stanley: (secretively) I know - I'm such a good faker!

Special Offer!

Beginning in January, 1990, Atari Interface Magazine will offer an ST/Mega Disk of the Month. This double-sided disk will be crammed full of the latest public domain and Shareware programs from sources such as CompuServe, GEnie, Delphi, Usenet and overseas sources in Germany and the UK. Each disk will also contain a short article that describes the contents of the disk.

These disks will be made available on a month-by-month basis for $6 per disk (shipping included) and non-AIM subscribers will be able to select an "AIM Disk-Only Subscription" for $60/year (a $12 savings).

But, if you subscribe to Atari Interface Magazine, you can get the ST/Mega Disk of the Month for ONLY $50/year! That's like getting over three disks ABSOLUTELY FREE! To take advantage of this new disk offer, fill in the appropriate items below (as well as your name and address on the above form).

YES, I wish to receive your ST/Mega Disk of the Month. I am an Atari Interface Magazine subscriber.

☐ Payment in Full Enclosed ($50)   ☐ Installment Plan: $25 enclosed, bill for balance

Please sign me up for your ST/Mega Disk of the Month Only Subscription. I do not wish to subscribe to AIM.

☐ Payment in Full Enclosed ($60)   ☐ Installment Plan: $30 enclosed, bill for balance

The ingenuity of ST programmers simply amazes me at times, and this is definitely one of them.

.ACCess!, from Rock Digital, is a handy desk accessory (DA) that gives you all the flexibility of a Command Line Interpreter (CLI). With .ACCess!, you can copy/delete/renamce/move files, get disk directories, copy files and more from within any GEM program allowing access to the GEM menu bar.

Sure, there are a number of desk accessories available that allow you to do those things, as well. But, .ACCess! has many more features...and .ACCess! gives you a CLI within a GEM window. You can resize the window, drag it to one corner of your screen and be able to switch back and forth from .ACCess! to your program.

You can create "batch" files and run them from within .ACCess!, and though "not supported" by Rock Digital, .ACCess! can execute TOS and TTP programs, often "tricking" them to run *inside* the .ACCess! GEM window. You can even run some GEM programs from within this desk accessory!

In a word, .ACCess! is...umm...elegant. Yea...it's elegant. It's kinda cute, too.

And for all you memory misers who refuse to use desk accessories, Rock Digital has kindly provided a TOS version of their program. You won't get the GEM window, and the added flexibility that comes with that window, but you do get a first-rate Command Line Interpreter.

If you're a user of programs such as DCopy or a "DOS Shell" program, you surely appreciate the added power and flexibility of a CLI...especially for file manipulation. If you've never used a CLI or worked in an MS-DOS environment, and never felt a need for more than what the ST desktop has to offer, you may not need what .ACCess! has to offer.

Just try copying over 100 files from one folder on drive A to a different folder three levels deep on a hard drive using the standard desktop, and you'll understand immediately how useful a product like .ACCess! can be.

With the unique feature of being the ONLY CLI (known to me) in a GEM window, .ACCess! becomes doubly useful.

For example, I was recently leaving a message on CompuServe and found I needed to quote from a text file I had previously stored on my hard drive. Using .ACCess!, I was able to type the file out and, while viewing the quote in the .ACCess! window, I added it to the message on CompuServe.

Without .ACCess!, I would have had two options. I could have used the VIEW command in Flash! to type the file to my screen, written down or memorized the quote and then typed it in.

Or, I could have loaded the text into the Flash! capture buffer (after saving what I already had loaded there), found the quote I wanted, separated it from the surrounding text with carriage returns, selected the quote as a block of text and then uploaded it directly into the CompuServe message.

All this for a couple lines of text. Makes me tired just writing about it!

In all, nearly 40 commands, 22 programming functions and 12 control flow/batch processing keywords are available via .ACCess!. Rock Digital has produced a desk accessory that is both highly useful and very innovative. Check this one out!

F-16 Combat Pilot by Digital Integration

by Steve Kendrick

(c) Copyright 1989 CM Publishing. Reprint rights reserved. Write c/o CM Publishing, PO Box 402, Schenectady, NY 12301 for permission to reprint.

"You fight like you train." —Motto, TOP GUN.

To put it simply, F-16 is a combat flight simulator. Then again, if you think about it, Dungeon Master is a fantasy game and Starglider is a space shoot-em-up. What elevates this new European import to the level of these classic titles is the way that it does its job, providing a state-of-the-art simulation as well as a novel strategic aspect, throwing in a few new bells and whistles too.

The F-16 Fighting Falcon is an intimidating air weapon, combining a multi-role interceptor, night-fighter, all weather aircraft, and adding an offensive capability as well. It can carry night-vision/targeting aides, reconnaissance equipment and a variety of state of the art air to air and air to ground weapons. Inside is the latest HUD [heads up display], avionics and electronic warfare devices. Powerful turbofan jets hurl the plane at supersonic speeds. Of course the F-16 pilot's job is no cakewalk, for the opposition sport skilled pilots and capable aircraft as well. Victory in the skies goes to the wiliest, most skilled pilot.

The video incarnation of the F-16 is no less impressive. Inside the cockpit are three main MFD [multi-function displays]. Unlike other simulators, these state of the art displays can be configured to provide a variety of navigational, radar and other displays and be re-assigned as the combat situation changes. All of the other instruments are colorful and realistically rendered. You can look about the canopy, with side and rear views accessible via the cursor keys.

The graphics aren't quite as flashy as Spectrum Holobyte's F-16 Falcon, but are competently done, with a minimum of display bogginess or awkward jumping. Control is touchy but responsive; your aircraft responds to your instructions without a noticeable lag and that "flying through molasses" feeling that many other simulations have. The joystick works the best, but you will probably prefer the keyboard controls for the fine positioning on a runway approach.

Upon booting, you first get a colorful title/credits screen. You are then presented a graphic representation of the squadron commander's office, where you select the various options by mouse [clicking on the pilot for a quickstart game, the filing cabinet for accessing your pilot data, et cetera]. You can call up colorful renditions of enemy aircraft and available weapons spec diagrams, as well as a demonstration. After saving a record of your pilot on a scratch disk, you click on the exit door to go to mission selection.

There are five main options available at the missions selection screen, as well as TRAINING EXERCISES [goofing these doesn't affect your pilot's condition] as well as GLADIATOR [one on one vs. a human on another ST via null modem]. These missions are:

Hammerblow: attack of enemy air installations and defenses, such as SAM [surface to air missile] sites, early warning radar arrays and enemy intelligence installations.

Deepstrike: attack against enemy logistics assets — fuel dumps, factories and power stations.

Tankbuster: strike against enemy armored battalions.

Watchtower: reconnaissance mission over various enemy sites.

Scramble: interception of enemy aircraft.

Successful completion of each of these missions at least once allows you to attempt Operation Conquest, a campaign scenario. In this scenario, you are the squadron commander, charged with the reduction of enemy fighting capability. It is up to you to devise a suitable strategy, selecting both your missions and the missions of up to four other allied aircraft.

Selecting an option brings up the map box, depicting the combat theatre. You receive your target coordinates [if you've selected a specific scenario], weather and intelligence report, and target data. You can select your WAYPOINTS [which when fed to your navigation computer provide your course to target] as well as assign missions to your fighter group in the campaign scenario.

After selecting a mission and making a flight plan, you go to weapons selection, a realistic-appearing rendition of your aircraft being readied in the hangar. You have a menu of systems [which may or may not be in stock] which you place on the appropriate hardpoints [weapon mounts] of your craft.

There is a wide selection of weapons at your disposal: AIM-9M short-range infrared-homing and AMRAAM medium-range radar-homing air-to-air missiles; Maverick infra-red and laser-guided air-to-ground missiles; DURANDAL anti-runway bombs; HARM anti-radar missiles and several weights of unguided bombs. Also accessible is your M61A1 Vulcan air-to-air autocannon, your internal fuel tankage as well as expendable external drop tanks, anti-radar chaff and anti-IR flare charges, ATARS reconnaissance pod and LANTIRN target designation/night vision pods.

You select what you need, and then it's off to the runway! You type in your IFF transponder code [identification, friend or foe] — yes it's the ubiquitous manual look-up copy protection. Send your callsign to the control tower and receive the response "Roger, PEGASUS, clear for takeoff." Taxi onto the runway, set the wheel brake, then slam the throttle full open, feel the afterburners kick, pull back the control stick at 150 MPH and you are airborne....

Success at any of the missions involves the mastery of three separate skills: flight management, use of instruments, and resources management. Flight management involves all the skills of handling the aircraft, such as takeoffs [pretty easy], landings [tough!], attack maneuvers and aerobatics. Most important of these are bomb run approaches, enemy tail lock-on strategies and low altitude maneuvers — you have to fly at less than 500 feet to avoid enemy ground radar detection [and subsequent SAM and interceptor attacks].

Practice also confers the ability to execute escape maneuvers that will put you in a more advantageous position, without slamming into the ground at supersonic speeds or conking out the pilot with excessive g-forces. You can get a feel of how the aircraft responds to the variables of airspeed, altitude and angle of attack [how much work the wing must do to keep you airborne]. The fly-by-wire system, which translates your control inputs to commands to the aircraft control surfaces without pilot intervention, keeps you from making many maneuvering errors but it is still possible to goof up. Landing in itself is a difficult task, and you will probably prefer to turn landing over to the avionics with the AUTOLAND key. This takes the ILS glideslope radio beam information and controls the aircraft for a safe landing.

You must also learn to use your instruments to their best advantage. It is possible to get swamped in too much information, so it is best to have your MFDs configured to provide only the necessary data. Overuse of your radio or radar transmitter is to be avoided, as this can alert the enemy to your activities. Keeping to a well-devised flight plan can help you avoid unnecessary conflicts with enemy defenses and keep you on-course to your mission objective.

Resources management is a crucial but often-overlooked aspect of combat. A flight plan and weapons selection that does the most for the least work is obviously very desirable. It is much easier to complete a mission when you conserve fuel and slip in and out without interception. Being overladen with heavy weapons impairs your ability to maneuver and evade attack. Taking good weapons and using them efficiently can avoid many headaches. Firing a fire-and-forget air-to-air missile, or using your LANTIRN pod with a laser homing warhead, can keep you out of those hairy close encounters. Maintaining appropriate airspeed and altitude makes you more maneuverable, keeps you out of radar lock and puts you in a position to strike without making yourself vulnerable. This also makes it much easier to avoid getting yourself lost, disoriented or in hot water. I would say that 75% of your success comes from these, and raw reflexes and skills do the rest.

Before I give you the misconception that this is the "perfect game," I need to point out some shortcomings. This game is copy-protected and comes on two 360K disks. Read this as a lot of disk swaps, even if you have a hard drive or second drive [the software doesn't recognize a B drive]. The book-based protection scheme is irksome. You have to look up a code on every mission, a level of protection that is both unnecessary and needlessly annoying.

The graphics are not at the edge of the state of the art, although they are competent, and there are no digitized sound effects that one finds on other simulators running on one Meg or bigger machines. There is a flaw in the random map generator — I have seen a map which has a river with no outlet! The manual is talky and at times uneven in organization and content, and I feel that many helpful hints and even very important information is omitted and I wish for more illustrative examples. There are a fistful of keys that you must know to use the program too, and sometimes the program fails to recognize key inputs.

However, don't let this dissuade you from acquiring this title. The manual does a good job of providing colorful background information and important data about the workings of your plane and weapons. The graphics shortfall is more than made up for by the many options available. You have a lot of choices available in the five scenarios, and an almost inexhaustible replay value in the campaign scenarios, a feature that I have not seen in any other flight simulation.

There is a high level of realism, with enemy aircraft, weather and other conditions acting in the expected way. You can't help but feel that you are actually flying — a padded flight couch, G-suit and some aviation fuel fumes are all that are necessary to complete the illusion. Thoughtful touches abound, from the way the instruments respond to the "warhead's eye view" video display.

This is a must-buy for any simulation buff. It is a well-planned and integrated package, and it makes me look forward to the next wave of European software simulators. Happy MiG-hunting!

ATARI CLUBS OF DENVER

The Atari Club of Denver's November Meeting

It was a darned and stormy night. Suddenly a DOS rang out. A door slammed. The maid screamed! Suddenly, a pirate BBS appeared on the horizon!

Yeah, so the above is a direct copy of the first minutes I ever wrote for the ACCD over (gulp!) three years ago! And I'm still looking for a gullible victim to take over this job!

As we all know, November is when we make nominations for suckers to take on officer jobs. The usual gang of nominees were/are Paul Mirci for Librarian, Guy McDaniel as Treasurer (Since Guy has increased our funds to an unprecedented high, this remains a necessity!), Tom Iowa as Executive Director, no-one wanted Secretary, Chet for Emperor, and Jerry Mathers as the Beaver. Refreshments were served and games were played.

The game was "How in the name of Fuji can we get Diamond Write to WORK?!@*!" Diamond, which showed as an excellent operating environment (Looks just like GEM and permits LOTS of memory to be addressed — up to 16 meg!) in current and previous demonstrations, failed to do anything when it came to its own word processor! Wait until version 2.0 or more before throwing money away to Diamond Write.

Club business? Well, we determined to donate an XEGS to the 3430th Technical Training Group at Lowry Air Force Base for their Christmas door prize. (Yeah, we know the value of publicity when we see it!) We'd already donated one to a local school, and we decided (Sure we voted on it, but aren't you as tired of seeing the word "vote" all the time? Sure you are!) to follow up with similar donations and volunteers to speak and/or tutor local students on the Friendly Computers. (You can't convince me that there are friendlier computers than our Ataris, whether 800, XL, XE, or ST. Even the Mac and Amiga line have their user-nastiness.)

Paul and Mike spoke at length about the new club BBS, and begged for extra equipment. (Oops! I forgot to give Paul that printer cable!) The board will be run on an XE, but will probably be carrying a lot of ST stuff (Should that be "STuff"?) too. And Mike gave us more of the low-down of our absorption into AIM (which you should be reading this in, so there shouldn't be too much question about what AIM is... unless you're just not paying attention. Go look at the cover and the contents page, then come back here.), and what we can expect to get away with. Everyone voted to subversively take over all of AtariLand, starting with AIM, and then rule the world.

After we rule the world, maybe THEN we can get the parking lot fixed at our meeting place!

Chet

The Last.... Power of Babble by Wesley Crusher

Sadly enough this may be my last column for awhile. But, you never know.

Da' Dudes Since Mike has been a twit there are no more director's meetings until he gets a real personality.

Da'Club Unfortunately I was unable to attend the great M.U.L.E. tournament. I was busy with my new business opportunity (see the ad section below). But from what I hear, Mr. Ed and Friend got into a big fight. Mr. Ed's nose was broken. And it was the best meeting ever! Should have been there. By the way, the winner of the game was an unknown radical dude.

Da'Stuff With the help of Greg, I have been in the process of putting a few new Starfleet Icon disks together. Come in and see what we've got!

BBS News and Blues NEWS!! A new BBS is up and I am part of it! This new BBS is called TERMINAL FROST, run by John Falcon-*fytr, Lord Warduke, Styxx, Visigoth and myself. Come and see what all the excitement is about. 24hrs a day, 7 days a week! Running BBS Express PRO! at ( ) 355-1933

NEWS!! A new BBS is up and I was not asked to help! The ATARI CLUBS OF DENVER have a new BBS up and I am not part of the growing process! It is for library requests, news and things like that. The SysOps are the Atari Club's librarian Paul and of course Mike. The number is ( ) 699-2673.

And now, a Word from your local sponsor...

THE WRATH OF WESLEY

December will be my last month as president. Thereafter, I will only hold the low-life job of Librarian. But, I would just like to be serious for a moment with y'all. I would first like to give my thanks to Chuck for nominating me to VP that lead to my present post. I would like to thank Mike for the advise and crud he gave me. I would like to thank all of Starfleet for their support. I would like to thank all of those who have worked on the newsletter since I have been with the club. Without them the Power of Babble would have never made it on the air.

Enough of the thanks. I will still be around and maybe Babble will continue if there is enough support. Remember all of us need to support the ATARI before it really does die.

So for now, goodbye cruel world. I cannot live no more. Good-bye, good-bye, I will now take my own life with a phaser. Good-bye.

At the December 5, 1989 meeting,
the Atari Club of Denver will hold a drawing for a

Free XE Game System

Tickets for this drawing will be given to
PAID MEMBERS ONLY.
Members must be present to win.
Only one ticket per membership will be issued.
If we get enough support for this, we may have regular drawings for $50+ hardware and software items.

ACCT

From the Prez: Our November meeting was held on the 13th and 'lo and behold', new members! Some of the topics covered were the news that ST developers have formed their 'self defense' group and that Artisan Software's Revolution may have great potential.

On the ComputerFestival, I would like to thank all those who helped out to make our booth the success it was. We had many folks stop by to say hello and had some new and renewed interest in the club's direction. Those plans include having the SIGs during the regular meetings, planning excursions to local businesses and industries that utilize computers in their daily operations, and bringing in people to speak on various computer related topics. So all in all, 1990 should be a very good year for ACCT.

Our December meeting will not be held, but our annual Christmas party will take place on Dec. 10th at the Temperance, MI. branch of the Peoples Savings Bank from 1 to 6 pm (We eat at 3 pm).

During this season of good cheer I would like to wish the staff at Unicorn Publications all the best for next year. To all the participating and affiliated clubs a Merry Christmas and a Happy New Year, and may 1990 bring to you great success plus renewed strength in membership and interest in your clubs and these great computers from Atari.

REMEMBER — DON'T DRINK AND DRIVE

Cascades Atari Computer Enthusiasts

CACE

Cascades Atari Computer Enthusiasts is the Atari Club in and around the Jackson County area. The main purpose of the club is to help inform new users, and to promote the use of the Atari Computer in the community.

President	Brent Fisher	(517) 764-4599
Vice-President	Tim Hotchkiss	522-8912
Secretary	Joe Cripps	782-0199
Treasurer	Craig Schaff	787-3970

The C.A.C.E. BBS, is run by the club and is open to anyone with a modem. The number to call is 1-517-787-4011. The current membership dues are $14.80 per year, and are payable at any of the C.A.C.E. monthly meetings, or by mail to the P.O. Box. Club membership includes access to the entire club software and publication libraries, along with a monthly published newsletter.

Any written communication with C.A.C.E. should be sent to: P.O. Box 6161, Jackson, MI 49204. Our meetings are held on the second Sunday of the month, from 1 pm to approx. 4 pm. The meetings take place in the basement of the East Side Lounge at 2214 East Ganson, Jackson, Mi.

Fishin' Around by Brent Fisher

Well guys, I don't quite know what to say, but it looks as though our meeting place is no more. Well not quite. It seems that the last couple of months that we have tried to have a meeting at the East Side Lounge, they have been closed on Sunday. So our only recourse it seems will be to have the meeting in a different place or choose another date. Our open possibilities appear to be: Craig Schaff's house at least for the December meeting, possibly moving back to the Boo's Center in Loomis Park or just changing the meeting day to Saturday. In any event I'll give you all a call to let you know what will be up. The next meeting will take place on either Saturday December 9th, or Sunday December 10th.

After reading a recent issue of Zmag I read some disturbing news. In issue 179 Matt Ratcliff has reported that ANALOG will cease publication with the December issue. This definately bodes bad for those of us who loved that great programs that ANALOG has published over the years. Well maybe we can all get our subcriptions back. Either that or Larry Flynt converts them all to Hustler subcriptions.

I'm afraid that this month is a dry month for the writers. Not that we are having a writers strike or anything, it is just that no one seems to have anything to say to their adoring fans and public. Well since the responce to what I said about the Hybrid Arts MIDI sale seemed to just bounce off of everyone's head, I'm not going to worry, just enjoy.

So one and all happy holidays, especially if you all get this before January.

Central Connecticut Computer Club

The Central Connecticut Computer Club is the oldest, still operational Atari club in the state. Conceived in December of 1980, and operational in January of 1981, the CCCC continues to serve the Atari community. New blood is welcomed, and of course, old hands are always welcomed back.

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at Eastern Computer Video, 1207 Meriden-Waterbury Turnpike, Milldale, Ct. 06467.

Prospective members may call Rich Scheidel (203)589-9035 or 589-3738. Failing that, call Tim Brandt, (203)283-0500, or write, CCCC, 127 Pinnacle Rd., Bristol, Ct. 06010.

Dues are $25.00 per year,$30.00 for family plan. Includes Voting membership, Newsletter, access to Club library (8-bit and ST), access to Club magazine library , discounts on computer and video supplies at Eastern Computer-Video, and access to the Club message base at Ultra Project BBS.

Greetings! Welcome back, my friends, to the show that never ends. My nation-wide quest for a used 1040 color system for a friend has ended successfully. Thanks to all that responded. I'm about to do it all again, this time for the club. It was sad that we had several club members show up with demos and had no computer to use them. I really didn't expect it so I didn't bring my Mega. I DID have a load of paperwork to be read and voted on by the members concerning club business. So I apologize to the members and WILL arrange for a computer to be onhand for the next meet.

What happened at the meeting, November 15th? Well, let's see. The club voted to enroll in AIM's disk o' the month deal, we got back the library (ST) and will be in the process of revamping everything to a double sided format to save on disks, of course. We had a look at the infamous GCR, and sadly, I mean just a look. Remember, I didn't bring the computer. So, we discussed Spectre GCR and passed around the manual. Then, while we were on the subject of Dave Small, our 8bit librarian Tim Brandt mentioned something about a dream machine that may soon be underway at Gadgets....a plug in 68030 cartridge. This possibility and all the additions that could accompany it set the scene for the balance of the evening. We even envisioned a few extras to include in the project as well, such as including a three position switch to select the desired Operating System. Imagine that...just like our old 8bits. We could have TOS, or maybe Spectre GCR, or even the pc Ditto II in addition to the 68030 along with double or triple the ram available now. How about utilizing those 1.44 or 2.8 Eye-Bee-Yem floppy drives? The possibilities boggle my wallet.

Also worth mentioning is the fact our Membership IS starting to trickle back. Having a newsletter that is entertaining and produced reliably is having a definate impact. I saw issues of AIM (from our members) at TWO other locations that sponsor Users Groups. A sad note. One of Connecticut's most prestigeous Atari headquarters, 20th Century TV in East Hartford, has announced they are closing their doors forever. We wish Brian and the employees of 20th all the best for the future. We also wish to extend a helping hand to STATUS and invite them to attend CCCC meetings every 3rd Wednesday until they are situated again. We would especially like to see this happen so as to feel out the whole club's reaction to going to a state-wide organization.

The next meetings will be December 20th and then January 17th. Remember, renewals and elections will be held in January. Club dues are going to be reduced the next year to because the officers feel we owe the membership a year's worth of newsletters (besides that, I just feel like playing Santa Claus. Hell, I already have the beard).

Nationwide pitch.....does anyone know of a 520STFM on the cheep for a club to purchase? Central Conn. Computer Club needs its own ST. If you have one, reply by mail to Rich Scheidel (Yankee Rich) 127 Pinnacle Rd., Bristol, CT 06010 or look me up on Sunday night at the Compuserve Atari8 conference after 9pm. I will usually be there or someone WILL pass the info to me for you.

I now return control of this newsletter to you...see you next time....zbye.

C.O.A.C.

Central Oregon Atari Club

- Dedicated to Central Oregon Atari Users and Enthusiasts Since 1986 -

President	Norman Moore	(503) 447-3598
Vice President	Jim Downes	(503) 382-0123
Treasurer/Editor	Glenn Dulin	(503) 382-3956
Secretary	Nancy Kanski	(503) 548-8201

Adress: PO Box 6842 Bend, OR 97708. Membership dues are $1 a month and $1 a year for each additional family member. We meet every second Saturday of the month at 5 pm at the Ann Rita Conference Center, which lies just in front of St. Charles Hospital on Neff Road in Bend.

Well, we didn't have nominations at the November meeting. We felt we had too small a group. Probably by the time you read this, we will have had our December elections. In January's AIM, we will list the newly elected officers, including a new office, more on this later.

There is quite a delay time relative to what is happening or what we need to convey to our members and the time that the AIM newsletter gets to us. I'm not complaining about AIM; we are just going to have to think and do farther into the future than we are used to. We have discussed moving our club meeting to later in the month so that we would get the newsletter before hand, but this leaves us with normally sending our stuff to AIM with no information about decisions made in that month. Either way, we are going to be a month behind.

We are going to establish an 8bit Vice President with the hopes that this may help the club organization to provide more attention and support for the 8bitters. The STs are gradually taking over, but we still have 8bit users who need help from the top. The ST people are pretty tight, and we do a lot of sharing information and heloing each other out. The ST people also seem to be those who more consistantly show up at the meetings. If the 8bitters fail to get together and communicate with one another then, I assume you don't want to.

Here is a special message from Marc Hitson: We are initiating a special interest group for users of 8bit computers. If any of you 8bit users out there have any input regarding programs you want to see or any problems you would like resolved — bring ideas and questions to the next COAC meeting, or call Mark Hitson or his daughter Gretchen at 548-0513, anytime.

We want to support the 8bitters too. By the way, most of those with STs have owned 8bit machines, so go ahead, pick their brains too!

Glenn

GKAUG GREATER KALAMAZOO ATARI USERS GROUP

GKAUG meets the second Saturday of each month at 11:30 AM in the Arcade Center Star World, 6151 S. Westnedge Ave. Kalamazoo, Michigan, across from the Southland Mall. Dues are $20/year.

President	Frank Fellheimer	(616) 657-6106
Vice President	Dan Youngs	
Librarian	Bill Berner	
Archiver	Dave Oldenburg	
2nd System/GKAUG BBS		(616) 385-2448

We run a 130XE with 320K/7 DD Drives/BBS EXPRESS! PRO node #197

I was fortunate enough to make it to the November meeting. We had about eight people there. Bryant was ill, so he had to forego the activities this month.

We did some printing on my Star NX-1000C color printer. Mostly lotto numbers. I managed to put together a few routines and the lotto program sorts your numbers, allows you to select your number range, and prints each line in a different color. I will be putting this on the BBS as soon as I get a chance.

For those of you that have a color printer, I have been upgrading a few Analog and Antic programs to make better use of the color capabilities of the Star NX-1000C. I have done a little basic routine to set up the color selection/inserted some code for MiteMailer and VHS labeler program.

We talked about how the club shall be handled in the near future. It is still under advisement and we will discuss it more at the next meeting.

Next, we ordered pizza and went into the arcade. All in all, I was there about 3 hours this time. I found it most enjoyable. We had a couple of ST users there as well, they still need a leader to strike up some really good programming sessions.

I ordered a graphics scanner. Maybe I can have it ready for Demo for the Dec 09th meeting.

See yah soon: Frank

GRASS
GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

Next Meeting: Wednesday, January 3rd, 6:30 p.m. Wyoming Public Library, 3350 Michael S.W.

Tim Feenstra	President	(616)784-6230
5625 Buthview NE, Comstock Park, MI 49321		
Greg Williams	Vice President	(616)698-7319

Terry Reine	Membership	(616)698-7244

President's Monthly: 19 November, 1989

Well here I am, 2 days late and still not sure what to write about. It is not easy to write something a month and a half ahead. I do know I am looking forward to the Textpro vs. Atariwriter showdown that has already taken place at the December meeting. Textpro is a good word processer, but Atariwriter plus has many good features too. Read the monthly columns here in AIM, devoted to Atariwriter to learn about it, but you're on your own when it comes to Textpro. Maybe someone will do a feature on Textpro for those who still haven't decided which is best for them.

There are still some bugs in the disk catalog program to be worked out, but time is short till after the holidays, so I can't give a time table for the finished product yet.

I would like to say that the user group pages for AIM are getting to be a who's who of Atari groups across the country. It looks like this is the forem for Atarians of the future. I guess in a way we are forming one of the largest Atari user groups anywhere when you add all the members together.

The GRASS question page was in my AIM this month, so all members please fill them out and bring them to the next meeting so we can get an up to date hardware list made up. Send them to me if you did not make the December meeting, and I'll try to get something in text form posted on ETXE before Christmas. It is nice to talk to someone who has a special piece of hardware before you plunk down your bucks, only to find it doesn't do exactly what you want, or don't work with this program or that.

If any GRASS members get any of the new Atari stuff for Christmas, tell us about it, we would probably like to see a demo of it at an upcoming meeting.

Merry Christmas Tim

Layton ACE of Utah

ST Librarian:	Jerry Kennedy	479-3635
8bit Librarian:	Dave Young	776-6273

Next LACE Club Meeting: Mark your calendar for Wednesday, 11 October 1989 at the Clearfield branch of the Davis County Library from 7 to 8:30 p.m.

Headline: "Atari's Storming the Business Computer Market"

No it's not your imagination, it's my dream and it also should be Atari's dream. For the first time in Atari's history they are about to market a computer that will perform to the business needs. It's not perfect mind you, but darn close.

American businesses use IBM very heavily now, but the end is near. The reign of the IBM in business is almost over. The basic

IBM computer has been in existance since the early '80s. To make it to today, it has had more than it's share of upgrades to extend its useful life. However, the eventual death is inevitable. The IBM Corporation itself recognized this fact. As a result, IBM quit producing the XT and AT lines. Granted, the reason that they left this market may not be entirely because of the obsolensence of the product, but I'm sure that it played a strong factor in the decision.

Few choices are left for American business' next workhorse. The new IBM PS/2 systems, mini/main-frame computers (IBM BIG blues, DEC VAX series, etc.), Apple Macintosh or an assortment of others. Each of these have NOT taken business by storm. The reason is that they lack the transportability (except for the mini/main frames). Transportability is defined as the ability to move software from one computer to another computer of a different make and still be able to execute it. Languages in general are more transportable than operating systems, but operating systems are more at the heart of the computer systems. So, that is where the commonality must be, in the operating systems.

The next king of the computer hill has not yet been selected. American Businesses are flirting with UNIX. It's operating system (OS) has speed and power that rivals the mini computers. It's a standard OS that can be transported to another manufacturer's computer and, when re-compiled, will run as it did on the first. This is a strong benefit. Since software is the largest computer investment that is made, the cost savings here are obvious. Think of it, when the computer is replaced or upgraded, the software will still be able to be executed. No training, no new manuals to read, no software frustration or even purchases just to acquire what you once had on the old system. The purchase can actually be based on the real needs of the demand for speed, multi-users, etc. without a large software penalty.

Enter Atari — The Atari TT computer will be able to run UNIX (per press releases). In addition, it is affordable and expandable (however limited). Atari should recognize that it now has the new business machine of the future if their cards are played right.

Public release of the TT is highly desirable from my vantage point but is probably not the best approach. A strong marketing push into the business realm will do more for overall sales of the TT than any general public advertising campaign could ever do. Business sales will lead with the average consumer following in the purchases. But it doesn't stop there. Serious business computers have the R&D continually developing product enhancements and accessories for future release. Staff personnel are always available to help the customer solve problems. Atari, you must realize that the company survival is solely dependant on the perception of the company in its customers' eyes. It's a big pill to swallow, I know. But, to play with the big boys you've got to act like the big boys. Besides, I know you can do it. All you have to do is focus the company resources on it and then wait and see. Good luck Atari. I'll be rooting for you.

Irwin Brooks November 16, 1989

M.A.C.E. · M.A.C.E.
MACE
MICHIGAN-ATARI-COMPUTER-ENTHUSIASTS

Michigan Atari Computer Enthusiast members receive, as part of their dues, Atari Interface Magazine, a monthly magazine keeping them informed of what is new in MACE and the whole Atari community. Members are also entitled to purchase disks from the 8bit and ST public domain software libraries. 8bit disks are $3 each and ST disks are $4 each, and if you buy three disks from either library and you can choose a 4th disk absolutely FREE! Non-members may purchase disks at a slightly higher rate. Mail order is also available. For a catalog of current disks in our libraries, send $2 for either an ST or 8bit catalog to the MACE address below. Please indicate ST or 8bit when sending in your order.

The most important benefit you receive is the help and support from (and interaction with) other Atari owners. If you're having a problem, need advice about a software package or whatever, your fellow MACE members can and will help. That's what a user group is all about -- helping each other get the most from our computing.

MACE meets on the third Tuesday of each month from 7:30 to 10 pm in Room 115 of the Southfield Civic Center at 10-1/2 Mile and Evergreen Roads.

MACE can be contacted at PO Box 2785, Southfield, MI, 48037 or by calling Ed Hanson at (313) 675-0044 or Bob Retelle at (313) 483-7358.

Any MACE member who contributes an article which appears in Atari Interface Magazine is entitled to a free disk from the library of his/her choice.

MACE BBS Numbers:

October, 1989 Meeting Minutes

The Octber meeting was a Swap meet. Lots of old equipment changed hands. No other club business was addressed. The December meeting will be the annual Xmas party with lots of free prizes for MACE members. Refreshments will be available for all.

MID-OHIO
ATARI USER
GROUP

Mid-Ohio Atari Users Group Post Office Box 134 Ontario, OH 44862

Well, I am writing this after the November 11th meeting, which was held at the old location of A&B Computers on Fourth Street. It was planned for us to meet at the new location, but due to technical difficulties, the new building was not ready.

A new member joined the group this month, Kerry Bristel from Mt. Vernon. There were also several door prizes given out which included disk pouches, and mailing labels. There were almost enough prizes to cover everyone, so there were quite a few smiling faces!

A topic which brought a cool receiption was that of the 1990 officer nomination. This has been a problem for several years. It seems that it is like pulling teeth to get someone to accept a position. Because of this, there will be ballots made up ahead of next meeting, and there will be room to write in candidates.

Unless there are unexpected problems at the new A&B Computer store, the next meeting will be located in the West Park Shopping Center, near the Midas Muffler Shop. Meeting will be at the normal time, 7-9pm on the 9th of December. Issues to be dicussed will be 1990 officers, meeting day, continuation of the AIM newsletter, and a few other details. The club expects to donate more prizes as door gifts and drawings, so be there!

Middle Georgia Atari Users Group

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-922-5666.

The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 2 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

November Meeting Due to the club president having to work Sunday, the meeting was changed to 4:30 pm. We had a good turn out regardless of the delay. It may have helped in that I had called everyone the night before to remind them of the meeting, and we were able to get some more members to come. I may start calling members each month to help pick up participation in the meetings.

Rumors seem to abound as to why Atari has not brought us the Stacy or the Lynx. Regardless, neither product has shown itself on dealers shelves yet and there is a lot of speculation of just when they will appear. If the Lynx can hit the shelves before Christmas, then it still has a chance to be a hit, but if it doesn't make it, then it may be trouble for this machine. Speaking of game machines, word has it that some computer gaming companies are looking to just making games for the new 16bit game machines like the NES TurboGraphix and SEGA machines. Well, I guess they won't have to worry about Pirating. What I do think they need to look at is, how many people are going to want to pay $60 for each game that they want?

Another topic that is picking up some attention is the use of Scanners. With the increased interest in desktop publishing and scanners, people want to use graphics with their documents. How many advertisements have you seen showing a scanner being used to copy a picture out of a book? In many cases, this is a violation of copyright law. You cannot use someone else's work in your documents without permission. That includes the cartoon characters that many of us like to use and all pictures in books and magazines which are in most cases copyrighted material. For us non-artists, it will make it a lot more difficult to dress up our newsletters with drawings from other sources.

Of interest on this month's PD disk is an ascii file called REVOLUTION. This is a text file detailing steps that we, as Atari owners, can take to further the interest in Atari computers. Each month has a separate project for you or your club to undertake. This is an interesting concept that is being sponsored by Artisan Software. I encourage each of you to get a copy of this file, take a look at it and express your views at the next meeting. We also now have demo's of FunctionZ and Keymodem. Modem users will want to get version 1.3 of the XYZ modem program that gives you Zmodem downloads, many new features have been added. Also a program called Display gives you a graphical display of the space remaining on each drive. Those of you who like to try new formatters will like FloorMat. FloorMat works in low rez and gives you an option to back out of a format operation if you make an error.

Larry Roxby has donated 7 disks of PD software this month and I will be going over some of the programs at the next meeting. Of interest to some of our sports game people — Dave Crume's son averages 200 points against the computer in each game of TV Sports Football.

Cheat for IKARI WARRIORS — Get in the tank and run it into the first bunker. Before it can blow up, push F1 to restart the game. When you get into the tank in the new game you will be indestructible.

Our next meeting will be at the regular time of 2PM at the library. Be sure to bring a blank disk and pick up some of the latest PD software. I hope that you enjoy the AIM magazine and can get some of your friends to subscribe through the club.

PORTS ATARI P.A.C.E. COMPUTER ENTHUSIASTS

President	Tracy Hendershot	525-1058
Vice President	Larry Nadeau	525-7430
Sec/Treasurer	John Zupansic	394-9326
ST Librarian	Don Henricksen	729-6309
8bit Librarian	Gary Armbrust	729-6906
ST Coordinator	Geoffrey Bennett	722-3354
8bit Coordinator	Aaron Potopinski	525-1058

Membership to PACE is $30 per year or $9 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local Bulletin Boards. Membership includes a monthly newsletter, monthly meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. PACE hardware assets: 130XE, 1050 Drive, MacInker and a Supra 300 baud modem. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

From the President... Is that snow I see outside? Snow, ice and cold, ECCH! With our outdoor activities declining rapidly, as with every winter, we'll have additional time to spend behind the computer. Already, consistently quiet BBSes are now becoming more active. I plan on doing some work with databases, uploading new software to Micro Simulations and fine tuning my MIDI expertise. Early in 1990, I would like to have a full blown MIDI demo that will be second to none. What are YOU planning on sharing with your fellow Atarians?

Our fifth annual Christmas party will follow December's PACE meeting. Like before, if everyone brings just a little, we'll have more than enough to make a full evening. Munchies, music, a door prize and computer talk. Don't forget to bring your children; there'll be plenty of JET FUEL for them!

Items of interest. The Atari Portfolio has finally reached the marketplace. It is receiving mixed reviews from the IBM publications. The STacy portable is still awaiting FCC approval. Sig Hartmann, long time Atari spokesperson, retired November 1st. Keith Ledbetter has shipped his first batch of Express! terminal cartridges to customers recently. Aaron Potopinski reports there is no sign of the Atari Lynx (hand-held game unit) in the Duluth/Superior area as of November 14th. Roy Goldman is currently working on Daisy Dot 3.0 for the 8bit. A multitude of new features and bug fixes will abound in this updated version. No idea whether 3.0 will be commercial or public domain.

Our ST Express magazine and disk arrived last week. This issue is dominated by game reviews and should steer you in the right direction when you buy that Christmas present for the kids or yourself! The Express disk will be distributed to paid-up members free of charge. I have also uploaded the files to Micro Simulations to download at your own leisure. We have also subscribed to the AIM ST Disk of the Month, a double-sided disk full of ARCed files selected from the major online services and from sources across the world. The AIM DOM will be available on our BBS as well as at the meetings.

Hot off the Z*Net Newswire: John Anderson, former editor of Computer Shopper and longtime Atari supporter, most recently acting as Senior Editor of MacUser magazine, was reported killed in the San Francisco earthquake.

Remember, Christmas is right around the corner. Keeping with the spirit, send your Christmas contribution to your favorite author of shareware software. These people work long hours bringing us excellent programs to enhance the performance of your 8bit or ST. Also, support the many companies who offer software for the ST. If we won't support them, they won't support us!

Winter Meeting Notice: If weather conditions are unfavorable (extreme cold, snow storm) the meeting will be canceled. Just use common sense!

Next Meeting: Sunday, December 17th at the Wisconsin D.O.T. Building, 6:30pm. Call any officer if you need directions. Bring your ideas, questions and suggestions. See you there!

ROCKFORD ATARI COMPUTER CLUB

Serving the Greater Blackhawk Area of Northern Illinois

Rockford Atari Computer Club serves the North Central and Northwest area of Illinois. We invite anyone in the area to attend our meetings. We meet at Rock Valley College, Rockford, IL; usually on the third Saturday of each month. Meetings atart at 10 AM and feature demos on both the Atari 8bit and ST. Our Address is RACC, 3095 15 Ave. #1, Rockford, IL 61108.

Andy Learner	President	815-397-5316
Mark Kunkle	ST VP	815-874-5546
Jake Olbrich	8Bit VP	815-332-5303
Roger Creedy	Secretary	815-877-3769
Thom Lofthouse	Treasurer	815-654-1863
Dave Zolmierski	8BIT Librarian	815-654-0247
Mike Boughneit	ST Librarian	815-282-2530

November 20, 1989 As is my usual flair, I am running late getting our club notes into AIM by the deadline. Our last meeting, we had elections for new club officers. We are looking forward to the "Fresh Blood" making our club bigger and better. We have also signed up some new members, both ST and 8bit people. New members include: Jeff Raders, Dave Merrill, Bruce Kobishka, and Randee Lee

I'd like to thank those who have made our participation in AIM possible. Our meeting in December will be on the 9th. Yes it is very early, but due to the college closing for the holidays, and scheduling conflicts, we have had to take that date. After the first of the year, all meetings *will* be on the third Saturday of the month through the summer.

The December meeting is our annual Christmas party and Swap meet, so dig out those jewels you are not using, and bring them to the meeting to swap OR sell! That's about all I have for now, except to mention the BBS once again. (Like you knew I wouldn't!) We have dropped our link with the Wishing Well, but replaced it with the much more active Repair Shop from Salt Lake City, Utah. This BBS links with boards from California to Ontario, Canada, to South Florida. We really have an interesting network going and urge someone from the Michigan area, who might be running Express! Pro to get in touch with me to join our network. The BBS is Camille 2OOO (815) 397-5327.

Till next month, G'Data...Andy

Net$ware

Syllable Plus, is an Educational game by Joan Meinke Stoner. Is is available from Educator's Publishing Service. Programs for IBM and Apple are also available from Educator's Publishing Service programmed by Educator'S Tutoring Consortium consisting of Mr. Anderson, Stoner and others. I programmed an Atari version of Syllable Eight for my wife Terri to use tutoring children with learning problems.

Syllable Eight is available on our bulleting board the Camille 2000 at (815) 397-5327. Download the file, and send a check for $25 to Net$ware. Net$ware will send 10 percent to the SysOp or 10 percent to any User Group Affiliate.. This is not a shareware product. We hope you like it and hope you send some money.

Another superior program, called Spelling, is also available on Net$ware. The cost of Spelling is $10. Other programs will follow on a monthly basis. Checks or mail inquiries can be made to our club address above.

STANCE

President	Claudette Tishcler	226-5644
Vice-President	Gary	521-2855
Treasurer	Kathi Koenig	892-0881
Newsletter Editor	Joseph Adato	449-6881
Disk Librarian	Barbara Carlstrom	371-2732

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way. Membership dues are $12 per year with a one time sign up fee of $13.00. STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

ST CLUB EL PASO

The ST Club of El Paso is the only Atari ST and Mega user group in the El Paso area. Founded in 1988, The ST Club has distinguished itself as great help to those that are new to Atari computing as well as helping those that are old "hacks" at computing.

Meetings of the ST Club are held on the second Saturday of each month at the Richard Burges Branch Library, 9300 Diana. Meeting time is 12:30pm. Each meeting features demonstrations of the latest in software, and help for those that are having problems with particular programs.

Membership in the ST Club of El Paso includes the following benefits: A one year subscription to Atari Interface Magazine, discounts on computer supplies and software at Jenkins' Computer Store, discounts on services at local merchants, access to a huge PD file area, access to the ST Club area on STEP BBS, technical assistance, regular club auctions and social events. Voting membership is only $20 a year! (A great deal, when you consider that a subscription to AIM alone is $18!) Sponsored memberships are $15 a year, and newsletter only memberships are also $15.

To become a member of the ST Club of El Paso, call 915-821-2048, or write to: The ST Club of El Paso 10953 Yogi Berra El Paso, Tx 79934.

President:	Tim Holt	(915) 821-2048
Vice President:	Morris Miller	594-1906
Sec't/Tres:	Joann Anderson	751-2710
Editor:	Paul Stampfli	821-4861
Librarian:	Norm Bates	593-6234

From the Prez...First of all, let me say that last month's article "A SOB Story" was not written by myself as the credits claimed. It was written by club member Jay Hartley. I am sorry Jay was not credited with the article, as it was very amusing. (I could claim credit, but Jay could easily beat me up if he wanted to...)

Now, on to biz! The Christmas dinner was moved from Cappettos to Jaxons'. Not for any real reason, other than that I promised our westside members that we would have a function on their side of town. By the time you read this, the dinner will have been over. I hope you had a good time. A $25 dollar gift certificate to Jenkins' was given away, as well as one at the December meeting. By the time you read this, the meeting will have already happened. I hope I won. I hope I had a good time.

If you missed the November meeting, you probably missed one of the finest meetings ever! ST Animations. Terry Hughes demoed the video work that he has created using the ST. I was amazed. The amount of work involved was tremendous. (The amount of equipment in the room was tremendous. We haven't had that much stuff at a meeting since Morris Miller showed us how to MIDI!) He also played us the music he created using the ST. Thanks to Terry for all of his hard work.

David Thurman was next. He started off by showing the excellent animated short: The Snowman. Next, he showed us how the Vidi-ST works, and "shot us all." We made a nice group shot. If you missed the meeting, you are not in the shot. (Your loss) He then showed us how the ST can digitize sounds as well as pictures. What he did to my voice was er, not pretty. Anyway, thank you David.

Morris Miller won the first doorprize: Treasure Island, a game donated by Jenkins'. (It was written for the 260ST! A real collector's item.) The fact that the game had been sitting on Jenkins' shelf for six years had nothing to do with the donation, I was assured by Jim. David Thurman won the next doorprize: Tass Times in Tonetown. Congrats to both!

The treasury has about $300. (How's that for accounting!)

I believe that you all have received or will receive a copy of the ST Revolution Handbook in the mail or at the meeting. If you have not, then please let me know. I am going to jump out on a limb and dedicate our club to this effort. I don't agree 100% with the effort, but I do believe that one of the main functions of any user group is to "spread the word." Please let me know what you think. Don't worry, I won't ask you to picket IBM, or bomb Jess Thurman's. Read the contents when you aren't busy. The revolution starts in 1990. I hope you will join in. All you old 60's radicals, here's a chance to relive the "Good Old Days."

The January meeting features Touch-Up and the Migraph Hand Scanner. If you are into DTP, then this is the meeting for you. February features Spectre GCR if I can buy it without my wife knowing about it.

I hope that the new year brings you all the joy and happiness in the world. A merry Christmas to you all. 1989 was a great year for the ST Club, and I think that 1990 will be even better.

Viva el Revolution!

Until next month,

Tim

TACE TINKER ACE OF OKLAHOMA

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 72110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20.00, Correspondence - $15.00. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Tech. Advisor	Ron Hamilton	(405) 387-5649

TRI-CITY ATARI GROUP

The Tri-City Atari Users Group meets the last Saturday before the 18th of the month, at 9 am at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township. Upcoming meetings are December 16th, 1989 and January 13, 1990.

President	Steve Volker	(517) 685-9035
ST Librarian	LeRoy Valley	686-6796
Treas/Secretary	Marty Schmidt	792-6029
8Bit Librarian	Ted Beauchamp	686-8872

Club dues are $20, which provides support for both the 8Bit and ST, and full access to the club's PD library, along with a year's subscription to the Atari Interface Magazine. If you need to renew (or haven't joined us yet!), DO IT NOW!

FIRST UP... Hello again! There are a lot of things I have to pass on to you this month, but I thought I might mention if you had shown up to the last meeting, you would have heard it all firsthand. AIM is coming along very well, and the most recent evidence is the package we've just gotten and the monthly AIM disk. We are reregistering with AIM, to update and confirm any information, so they may better serve us. One area is the names, addresses, and personal abilities and interests of those club members who would like to be more actively involved in the production of AIM. I would like to see every member of TAG sign up, so give me a call and tell me what you would like to do.

The general consensus of the attending members was that the disk of the month idea from AIM is something to look forward to. I would like to know if you have any comments about changes or improvements in the AIM periodical, call me!

WHAT YOU MISSED! I guess the first point is the change in the time of the club meetings. Beginning with the December meeting, we will be getting together from 9 am to noon, instead of the 2 to 5 pm. So! Next time we meet I will be saying a 'tired' Good Morning!! to you!

An interesting archival note, that came up during the filling out of our new registration form, the first 'official' meeting of the Tri-City Atari Users Group was the 10th of September, 1983. I got the information from Marty Schmidt, our present treasurer, who knows the date firsthand. HE WAS THERE!!

Marty was up first, making WordPerfect look even sharper with the five single-sided disks already installed on his hard drive. I must admit I liked much of what I saw. The first thing I missed was the onscreen WYSIWYG, that I am so used to with my WordWriterST, but then 1st Word Plus didn't do this either. Marty tells me that if you use the preview function when printing off the disk, it will show you all of your document just as it will appear. The demo was cut short when an unfortunate combination of utilities and harddrive access caused his system to crash, but all in all a good showing.

On to LeRoy and his demo of 1st Word Plus. We had little time left for LeRoy, but he showed us enough to convince me that both programs have their merits. There did not seem to be a document preview function available, but it was also obvious that 1st Word was written to take complete advantage of the ease of the ST evironment. So I guess the competition goes on.

WHAT YOU SHOULDN'T MISS... Next month is the meeting NOT TO MISS!! This is usually the most enjoyable meeting all year, and this year shouldn't be any different. Our demo is a repeat of the Computer Chronicles show in which they showcase Atari and the ST computer. We will of course have the annual Swap Meet at this time, and don't forget to talk your wives and friends into cooking up all kinds of delicious little samplings that we can wolf down for our Christmas get together. 1983 to now, 1990, seven years, TAG's been around for awhile, and survived into the next decade. Not bad huh? MERRY CHRISTMAS ATARIANS EVERWHERE!!!

We will be formalizing our plans for the January Consumer Show at Fashion Square Mall at the December meeting, I have just heard from Dr. Charlie Brown of MIDI-TO-GO, that he would like to be represented with us, and might be interested in supplying a MEGA or two!

One more thing. I have, for a brief time, sat in the lonely President's seat at the TAG meetings, and I have a few thoughts to share about the view from here. First up, LeRoy Valley, we didn't say enough the day you relinquished this chair to me. We didn't Thank You enough for the years you spent holding this club together or for all the time you invested preparing for each meeting, or for all the time you must have spent at the keyboard writing the club notes. Hey! Sorry. We didn't really know just how much work it was. I for one am glad to see you in the back, working on some upgrade or handing out library disks, while I stand at the podium and try to get the rest of the club to join in.

My last point is like the first. To the extent that LeRoy, and Marty, and Ted and Bryant and others have given to the club, there is another, larger group that only takes. I would like to see each and every one of our members become more active within the next year. This is a challenge! We need you TOO!

Equipment volunteers for December:

We have Al Jennings bringing the VCR and the show tape, and we will be using the 8bit monitor for video output, so no additional equipment is necessary at this meeting. (But feel free to bring anything you want!! Someone might want to bring a machine to test all the great software to be had at the Swap Meet!)

The next meeting will be held on December 12 in the Wolverine Room. There will be door prizes, and don't forget to bring your favorite game! (Please also consider bringing some hardware, or the officers will be forced to do something drastic such as mailing nuclear devices with your next AIM!)

The November meeting was delayed while members watched a graphic demo on the ST which ran for 30 minutes. The Union's "Care Bears" demo, from Sweden, demonstrates text scrolling and even includes a friendly jab at Amiga by our friends Calvin and Hobbs.

President Craig Harvey announced the feature topic would be Desktop Publishing. Craig also noted the January meeting would feature Telecommunications. He is working on getting the necessary ingredients to discuss (and possibly demonstrate) Packet Radio communications.

Bill and Pattie Rayl put the most popular packages through their paces. Pattie managed the keyboard while Bill fielded questions from the members. Timeworks is good in the "easy-to-use" department but falls behind PageStream in features and power. Calamus should probably only be considered for the most serious, professional application. Bill is currently converting all of AIM to PageStream.

Paul Walkowski discussed some of his ventures into "DTP on an 8bit." Paul talked about how he produces newsletters for several organizations by literally cutting and pasting output from several different software packages. Paul has given up using Typesetter, Newsroom, and NewsStation. Vice President Rick Schrader discussed his foibles trying out of Fleet Street Publisher. He returned the package and is now waiting a refund.

ST Librarian Russ Crum announced a new updated catalog disk, and a Disk-of-the-Month which contained, two conversion programs for creating Degas clip-art from PrintMaster icon files and several PM files to start the process.

8Bit Librarian Mike Millage was out of town on his annual hunting expedition, so Stand-In-8-Bit-Librarian Harry Price announced a disk bundle special which included several SpartaDOS utilities.

A message from the WAUG Treasurer

XMAS shopping time again! Hope you all get your ATARI Xmas presents. This group now owns an ATARI 520 and two SS drives. We hope to have a DS drive soon.

Andrew Solomon is the newest member of our group; Eddie Allison, Ken Antkowiak and Wayne Inman have all renewed their memberships. Have a very MERRY CHRISTMAS.

Remember, if you wish to join WAUG or renew your membership, please make your check payable to DICK SELKE and mail it to 31139 Cooley Dr. Westland, MI 48185

Hard Disk Systems to Fit Every Budget

- All systems are complete and ready to use, included at *no extra cost* are clock/calendar and cooling blower(s)
- All ABCO Hard Disk Systems Are Fully Expandable (you are *not* limited to two drives only!) All cables and connectors installed
- Rugged Seagate Hard Disk Mechanisms!
- ICD Host Adapters Used Exclusively
- OMTI High Speed Controllers

MIDI MAX™

THE *AFFORDABLE* MIDI INTERFACE
For your 8-bit ATARI computer

● Compatible with all existing MIDI software for the Atari 8-bit computer ●

MIDIMAX comes supplied with
- MMS software with powerful editor
- AMS to MMS file converter program
- Easy to understand instruction manual
- Sample song files
- Two six-foot MIDI cables

MIDIMAX has a full 1 year warranty against defects in material and workmanship

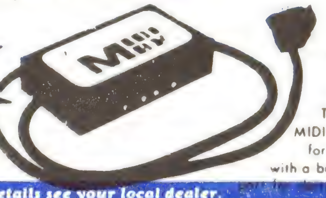
MIDIMAX allows you to control up to 16 MIDI instruments (synthesizers, drum machines, etc all at the same time!

MIDIMAX Incorporates MIDI MUSIC SYSTEM software developed by Synthetic Software

Requires minimum 48K and one disk drive

[illegible]

Proudly made in the U-S-A



ONLY $179

The ONLY MIDI Interface for the Atari with a built in I/O [illegible]

For more details see your local dealer.

Stowaway Professional

Disk Labeling Software for the ATARI ST

SYSTEM REQUIREMENTS
Atari ST or MEGA ST series computer, Monochrome or Color Monitor, disk drive, and a 9-pin or 24-pin printer.

Stowaway Professional is programmed for ease of use and speed in labeling your 3-1/2" floppy diskettes. It is a powerful, automated utility that will allow you to produce easy-to-read labels for your expanding library. All commands are accessed through the use of the mouse and/or the keyboard...whichever you prefer. Stowaway Professional is designed to work with virtually all 9 and 24 pin dot matrix printers. It will also work from a harddrive. And, the built-in multiple print option makes this program a MUST for all USER'S GROUPS!

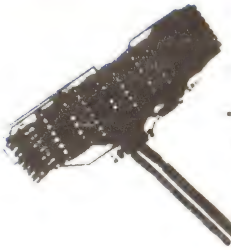
Cat no. 8805001 Price: $19.95

PREMIUM LABELS
For use with STOWAWAY PROFESSIONAL
100 labels ... only $6.00
Cat no. WT989100

RAMDRIVE YOUR 800XL!

256K Upgrade for your Atari 8-bit Computer.

While other companies left the 8-bit market for dead, we still support it!



- *Features gold contacts for reliability.*
- *Easy do-it-yourself installation.*
- *Minimal Soldering.*
- *Low Power Consumption.*

With all this extra memory, you can install an expanded ramdisk, load complete slideshows into memory, and use all of the programs that make use of the 130XE's extra memory! All you need is a screwdriver, pliers, soldering iron, and 8-41256 (200ns) dynamic ram IC's, and you're on your way to real 8-bit power!!!

Cat no. 5852507 Complete kit less DRAMs $20.00
Cat no. 5852507B PC board only-no ICs $12.00
Other Computer Upgrades are available for both the Atari 8-bit and 16-bit Computers...

Bob Brodie to Visit Users in Michigan

Atari's own Bob Brodie is coming to Michigan! "Mr. User Group" will be in Ann Arbor, Michigan and will meet with area Atari user groups and users on Sunday, February 18 from 1-3 PM at the University of Michigan Student Union (in the Anderson Room, to be precise!). Special thanks to the Washtenaw Atari Users Group for arranging the meeting space.

Bob will be showing the STacy and Spectre GCR combo to the MacTechnics Macintosh user group in Ann Arbor on Saturday, February 17 at 11 AM. It looks like the Macintosh community is VERY interested in this "poor man's" Mac portable -- they called him!

For anyone wishing to attend the Sunday meeting, here's a quick set of directions. Take U.S. 23 to I-94 west (or just take I-94 if you are coming from the east or west!). Exit I-94 at the State Street exit (near Briarwood Mall). Go north on State Street all the way into downtown. You'll come to a three-way stop with a flashing red light (S. University), and from there you can see the Student Union a little further up State Street and on your left. The Student Union is the tallest of the buildings in that block, with a set of three stairs leading to the front doors. If you come to Williams Street or Liberty, you've gone too far! There are a number of parking lots and parking structures in the vicinity of the Student Union...you may have to go around the block to find parking.

New Year...New Look...New Clubs

AIM has a few changes this month...all thanks to Soft-Logik's new version of PageStream. From the full color cover (yea!) to the slick new article titles (with no jaggies at large point sizes!), PageStream 1.8 has performed like a champ. Think of this issue of AIM as a preliminary review of some of what PageStream can do...we'll be running an actual in-depth review of this excellent program in the next issue (space permitting).

Speaking of space, perhaps you noticed this issue of AIM is pretty darn thick. If everything works out as planned (we're writing this before the magazine is all laid out), we're starting the year out with a full 52 pages including cover. We've also added a number of new participating clubs, including FACCS of Spokane, WA; BRACE of Lexington, KY (if their info get here in time. If not, look for them next month); RACE of Rapid City, SD; PHAST of Phoenix, AZ; and last, but not least, SPACE of Harrisburg, PA. That brings us up to a total of 24 participating clubs, with a few more "tentatives" for the February issue. It is due to the excellent articles submitted by all the participating clubs that we've grown to our current size. Keep 'em coming!

Bill & Pattie Rayl

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS. A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. BRAND NEW ITEMS

$\$199^{95}$ The "BLACK BOX"!© $\$199^{95}$

The **Black Box** is a device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It has two buttons, two switches, and a set of dip switches visible from the outside. It plugs directly into the back of the 600XL, 800XL, and 130XE computers. Custom cases may be an optional expense. The **Black Box** performs three main tasks: Interface to a SASI/SCSI bus device (hard disks), Parallel printer port, and a RS232 port. A fourth option, available soon, will be a floppy disk port, especially useful to XF-551 owners. The SASI/SCSI port provides the necessary signals for hooking up most common hard disks. You may partition your hard disk into as many drives as you wish; up to 9 can be accessed at at time. By pressing one of the buttons on the **Black Box**, you will enter the configuration menu, where you can re-assign drive numbers, etc. When you exit, you will be right back in the program you were running when the switch was pressed. Each hard disk can be write-protected. The Parallel Printer port will allow you to hook up any printer that uses the standard Centronics Interface. As an option, you can use the computer's extra memory as a printer buffer, or order the **Black Box** with 64K of on-board RAM. You may assign printer number and line-feed options within the menu (for use with multiple printers). Another amazing feature of the **Black Box** is the built-in screen dump. By pressing a button (on the box), the contents of your screen will be dumped to your printer (you can define text or graphics modes with a switch)! The RS232 port supplies the full RS232 spec signals for connection to a modem, or another machine (for null-modeming). The handler for the **Black Box**' s modem port is built in and takes up NO memory! The port handles rates up to TRUE 19.2K BAUD! A future upgrade for the **Black Box** is a floppy disk interface board. This will allow the addition of up to four 5.25" or 3.5" mixtures of floppy drives to be used with the system. The drives will act like standard single/enhanced/double density disk drives, but MUCH faster! All drives will be Super Archiver compatible, and support up to 2 sides of 80 tracks. Along with this hardware upgrade will come software capable of reading, writing, and formatting disks in IBM's MS-DOS format and the Atari ST format, and allow you to transfer files between those disk formats and the Atari's format. In addition , a machine language monitor has been added to allow memory disassembly, memory/register changes, and more. The Price of the **Black Box** is $199.95 for the basic unit and $249.95 with 64K of RAM (for printer spooler) plus $8 for S/H/I. An optional custom **BLACK BOX** case is available for $39.95 extra.

$\$199^{95}$ The "MULTIPLEXER"!© $\$199^{95}$

This device brings the power and flexibility of larger systems to your 8-bit. The **Multiplexer** is a device (actually a collection of modules) that allow up to 8 Ataris to read and write to the same drive (typically a hard disk), printer, and talk to each other. One 'master' computer (any 8-bit) is equipped with the master **Multiplexer** interface. Then up to 8 'slave' computers can hook up to the master, each having their own slave interface. The 'common' peripherals (things that are to be shared) are connected to the master computer. On each slave, all disk and printer I/O is routed through the master, so no drives are needed on them. The master computer can be configured in any manner you wish - you can for example have certain peripherals "local" to the slave, or routed to a different number on the master. Under development is a BBS system that will make full use of this device, allow ing up to 8 lines/users to be using the system at the same time! A mutiuser chat mode is a feature of this program, however, you do not NEED this program to run a BBS with the **Multiplexer** (but be warned that not all BBS programs will run concurrently). All slaves are independent, and do not need to have the same program running on them. This system is excellent for BBS SysOps, because you can be using your hard disk(s) while still running your BBS uninterrupted! Another example is in a classroom situation, or anywhere a disk needs to be shared by different people. This is an EXCELLENT programming/debugging tool as well! The **Multiplexer** price is $199.95 for a master and two slave units (plus $5 S/H/I). Additional slave units are $69.95 each.

$\$29^{95}$ "XF551 ENHANCER!"© $\$29^{95}$

The XF551 Atari drive is a fine product with one major flaw...It writes to side **TWO** of your floppy disks **BACKWARDS**. This causes read/write incompatibility problems with all other single sides drives made for Atari such as Indus, Trak, Rana, Percom, Astra, Atari 1050, Atari 810, etc. Add the **XF551 ENHANCER** to the new XF551 drive and your problems are over! This device will restore 100% compatibility while retaining original design qualities of Atari's super new drive. The **XF551 ENHANCER** is a **MUST** for all XF551 Owners. Installation is simple. Only $29.95 plus $4 S/H/I.

$\$99^{95}$ The "POWER PLUS"!© MEMORY UPGRADE $\$99^{95}$

(for 800XL'S and 130XE's only)

C.S.S. has made the **'Power Plus'!** memory upgrades available on an 'unadvertised' basis to our regular patrons. These upgrades have become so popular we are now making them available to everyone! For those of you unfamiliar with **'Power Plus'!** upgrade, it is the most COMPATABLE upgrade available for the 800XL or 130 XE. All other upgrade kits have some degree of INCOMPATABILITY with certain software programs. C.S.S. studied this problem and developed the **POWER PLUS** upgrade which, to the best of our knowledge, appears to be 100% compatible. To upgrade a 130XE to 320K is only $99.95. To upgrade an 800XL to 320K is only $149.95 (circuitry from a 130XE is actually transplanted into the 800XL). Add $5 for S/H/I. C.S.S. will install these upgrades for only $20 if you wish.

NEW! OUR 24 HR. BBS! (716) 247-7157

For product information, **WEEKLY SPECIALS**, informative discussions on new products, theories, products you'd like to see developed, and used items for sale or trade. **CALL (716) 247-7157** 24 hrs. This **BBS** also features multi-user **"CHAT"** capabilities thanks to our new **'MULTIPLEXER'!** which allows multiple user and **BBS** boards to be linked so several callers can share boards or talk to each other simultaneously! **CALL (716) 247-7157** for **BBS** only. For **VOICE** orders or repairs, please call our normal Hot Line number **(716) 586-5545.**

BEST SELLERS

$\$69^{95}$ The "SUPER ARCHIVER"!© $\$69^{95}$

The new **SUPER ARCHIVER**, obsoletes all copying devices currently available for the **ATARI 1050!** It eliminates the need for Patches, **PDB** files, Computer Hardware, etc. Copies are exact duplicates of originals and will run on any drive; without exaggeration, the **SUPER ARCHIVER** is the most powerful **PROGRAMMING/COPYING** device available for the 1050! Installation consists of a plug-in chip and 6 simple solder connections. Software included. Features are:

- **TRUE DOUBLE DENSITY**
- **ULTRA-SPEED** read/write
- **FULLY AUTOMATIC COPYING**
- **SUPPORTS EXTRA MEMORY**
- **SCREEN DUMP** to printer
- **TOGGLE HEX/DEC DISPLAY**
- **SECTOR** or **TRACK TRACING**
- **AUTOMATIC DIAGNOSTICS**
- **DISPLAYS HIDDEN PROTECTION**
- **ADJUSTABLE/CUSTOM SKEWING**
- **AUTOMATIC SPEED COMPENSATION**
- **AUTOMATIC/PROGRAMMABLE**
- **PHANTOM SECTOR MAKER**
- **ARCHIVER/HAPPY ARCHIVER**
- **COMPATIBLE**
- **BUILT-IN EDITOR**-reads, writes, displays up to 35 sectors/track short
- **BUILT-IN CUSTOM FORMATTER** up to 40 sectors/track
- **BUILT-IN DISASSEMBLER**
- **BUILT-IN MAPPER**-up to 42 sectors/track
- **DISPLAYS/COPIES** Double Density **HEADERS**
- **AUTOMATIC FORMAT LENGTH CORRECTION**
- **SIMPLE INSTALLATION**

The SUPER ARCHIVER is so POWERFUL that only programs we know that can't becopied are the newer ELECTRONIC ARTS and SYNFILE/SYNCALC (34 FULLsectors/track). If you want it ALL...buy the "BIT-WRITER"! also... then you'll be able to copy even these programs! Only $69.95 plus $5 S/H/I.

JUST RELEASED

$\$99^{95}$ The "SUPER ARCHIVER II"!© $\$99^{95}$

(for ATARI 1050 drives)

NOW! COPIES all **ENHANCED DENSITY** programs plus retains all of the features of our World Famous **SUPER ARCHIVER!** (see above). Allows you to **COPY** or **CREATE** single or **ENHANCED** density protection schemes (including **PHANTOM SECTORS!**). Completely automatic; compatible with the **BIT-WRITER I**; the **ULTIMATE BACKUP/PROGRAMMING** device! Only $99.95 plus $4 S/H/I. **NOTICE!** If you already own a **SUPER ARCHIVER!**, you can upgrade to a **SUPER ARCHIVER II** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$\$69^{95}$ The "ULTRA SPEED PLUS"!© $\$69^{95}$

Imagine a universal XL/XE Operating System so easy to use that anyone can operate it instantly, yet so versatile and powerful that every Hacker, Programmer and Ramdisk owner will wonder how they ever got along without it! Ultra Speed Plus puts unbelievable speed and convenience at your fingertips. Use **ANY DOS** to place an **ULTRA SPEED** format on your disks, boot any drive (1-9) upon power-up, format your **RAMDISK** in Double Density, activate a built-in **400/800 OS** for software compatibility, plus dozens of other features too numerous to mention! Below are just a **FEW** features you'll find in the amazing OS:

- **ULTRA SPEED** SIO for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from **RAMDISK**
- Special timer circuits not required for 1 or 2 Meg upgrades
- Background colors adjustable
- Reverse use of **OPTION** key
- Cold-start without memory loss
- Built-in floppy/disk configuration editor (1-9)
- Built in **RAMDISK** configuration editor(1-9)
- **RAMDISK** exactly duplicates floppy drive so sector copying and sector editing are now possible
- Built-in MINI Sector Copier
- Toggle **SCREEN OFF** for up to 40% increase of processing speed
- Toggle internal **BASIC**
- Ram resident disk loader program (**MACH10** menu)
- **DOUBLE DENSITY RAMDISK** capable
- Entire **MEMORY** test that pinpoints defective **RAM** chip
- Boot any drive (1-9) upon power-up or cold-start
- Supports memory upgrades up to **TWO MEGABYTES**
- **THREE** Operating Systems in one (**XL/XE, 400/800, ULTRA SPEED PLUS**)

$\$39^{95}$ The "RICHMANS"!© $\$39^{95}$

80 Colum Word Processor

Easy to use, very **powerful**, and **NO ADDITIONAL HARDWARE** required! Works with TV or Monitor! This **"DISK ONLY"** 80 Column Word-Processor is simple to use while offering numerous features such as:

- Completely Menu driven
- Self contained DOS
- Complete Text formatting
- Built-in Printer Drivers
- Page numbering
- Justify and Endfill
- High speed Cursor
- Spell Checker
- 80 COLUMNS ON THE SCREEN!
- Insert and Delete
- Search Mode
- View only mode
- Memory Statistics
- Alternate Output
- Change screen Colors, borders, luminesce
- Mouse compatible
- XEP-80 Compatible

One expert has compared 40 domestic and foreign word-processors and concluded that the RICHMANS 80 Column Word-Processor is the best! Only $39.95 plus $5 S/H/I. (64K required).

$\$79^{95}$ The "BIT-WRITER"!©

The Super Archiver **"BIT-WRITER"!** is capable of duplicating even the "uncopyable" EA and SYN series which employ 34 FULL sectors/track. The **"BIT-WRITER"!** is capable of reproducing these and **FUTURE** protection schemes of non-physically damaged disks. Simple installation... **PLUG-IN** circuit board and 4 simple solder connections. The **"SUPER ARCHIVER"** with the **"BIT-WRITER"!** is the ultimate **PROGRAMMING/COPYING** device for Atari 1050's. **EXACT DUPLICATES** of originals are made! Copies run an **ANY** drive. Must be used with Super Archiver. Only $79.95 plus $5 S/H/I.

$\$39^{95}$ The "QUINTOPUS"!© $\$39^{95}$

The **"QUINTOPUS"!** is an inexpensive device that provides a tremendous amount of convenience while eliminating the problems associated with the endless "daisy-chaining" of peripherals (eg: drives, interfaces, printers, modems, cassettes, etc.). The **"QUINTOPUS"!** is an I/O port expander that converts a single I/O output/input into five additional outputs/inputs. Instead of daisy-chaining all your peripherals (which often times results in passing a signal through 30 feet or more of cable!), the **"QUINTOPUS"!** allows each device to be connected directly to the computers through only three or four feet of cable. This is particularly useful when attempting to use **ULTRASPEED** or **WARPSPEED** data transfer rates. The **"QUINTOPUS"!** also provides the "extra" I/O ports often needed to connect devices not having daisy-chaining capabilities. Cable resistance and compacitance are greatly reduced thereby significantly improving the opportunity of accurate data transfers! Only $39.95 plus $5 S/H/I. SIO cable is $5 extra if needed.

$\$59^{95}$ The "QUINTOPUS"!© $\$59^{95}$

(with SWITCHABLE PORTS!)

This Deluxe version of the **"QUINTOPUS!"** has all of the above features with the additional benefits of two **SWITCHABLE PORTS!** This means you can connect two computers to one printer or two printers to one computer; you can switch in a computer/printer combination and while you're printing out a long document, switch in a second computer to access a modem, disk drive, cassette deck, etc! Switch multiple combinations of peripherals or computers without the hassle or re-arranging I/O cables...simply flip a switch! Only $59.95 plus $5 S/H/I SIO cable is $5 extra if needed.

HARD DRIVE SPECIALS

COMPLETE Hard Drive Systems from C.S.S. include the **BLACK BOX**, power supply, logic board, controller, DOS, cables and assorted software! All systems are wired, preformatted and have sample programs on them. Simply take it out of the box, plug it in and **BOOT**....no hassles! We currently stock 5 MEG to 80 MEG systems ranging from $495 to $895. Sizes range from 3 1/2 inch, 5 1/4 inch, to 8 inch industrial quality. Call!

Controllers available separately from Xebec, Adaptec, Seagate, Konan, and Western Digital. Call for pricing.

SPECIAL-SPECIAL! 5 MEG REMOVABLE disk Hard Drive — BRAND NEW — only $495 complete! Hard Drive sold separately in limited quantities for only $99.95. Excellent for backing up larger HD systems! (Original drive cost was $1100!)

LIMITED SPECIALS

These specials are available on a first come first served basis. Pre-owned items are in exceptionally clean condition and are in perfect operating order. All items are warrantied. Sorry ... no rainchecks. Order 5 or more items and we'll pay the freight. These SPECIALS are for C.S.S. customers only - NO DEALER DISCOUNTS! Add $5 to order for S/H/I.

	NORMALLY	LIMITED SPECIAL
1. 130XE with 320K POWER PLUS upgrade and Ultra Speed Plus installed (with power supply and cable)		$ 250
2. 1050 DISK DRIVES with SUPER ARCHIVER II and SILENCER installed (with power supply and cable)		$ 250
3. SUPER PILL (without case)	$ 80	$ 22
4. ULTRA MENU/DOS	$ 30	$ 19
5. DISKCRACKER (Newest version)	$ 50	$ 19
6. ELECTRONIC PHANTOM SECTOR MAKER DELUXE	$ 60	$ 35
7. IMPOSSIBLE for 800 or 800XL	$ 150	$ 69
8. KLONE II (Generic HAPPY Backup)	$ 100	$ 75
9. SILENCER	$ 30	$ 19
10. BLACK PATCH (MASTER)	$ 50	$ 25

REPAIRS

For 24-48 hour repair service on Atari computers or drives, call our repair department at (716) 586-5545 day or night. All work is guaranteed, NO minimum estimate fees: If you have two or more items for repair and don't want to spend any money .... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE ... we'll keep the other defective item for parts!

ATARI BULLETIN BOARD

by Bill & Pattie Rayl

Tos 1.4 in 2 Chip Sets

TOS 1.4 is now available to Mega ST owners in the two chip, Masked ROM set. Those Atari owners who waited are rewarded with ROMS that will take far less power than the six chip set and will easily install in the newer STs with old 2 chip TOS.

Those owners who did install six chip TOS 1.4 sets to replace their old TOS 1.2 two chip sets had to install four sockets to hold the extra ROMs, and some even had to replace parts on the motherboard because the six chip sets drew so much power, other "working" buffer chips didn't.

If you'd like the two chip set of TOS 1.4, call your local dealer or Best Electronics at (408) 243-6950, and ask for Atari Part #CA400407.

Stacy is Approved

The Stacy has finally passed FCC certification and will begin appearing on dealers shelves late January as the Stacy 2 & 4. The Stacy 2 is a 2Meg version and Stacy 4 is a 4Meg version. Both editions will come with 40Meg internal hard drives. No word yet on when the low-end Stacy (1Meg and no hard drive) will be available.

Canadian Ads

The Stacy and STE were featured recently in a Canadian commercial during the Grey Cup. This is reportedly the biggest game in Canada.

The Lynx Ships

The Lynx was apparently a big success with shoppers over the holiday season. The shipments to Sears and the New York City area were completely sold out in a very short time.

There was one report of a Toys R Us having sold out of 200 Lynxs in under two hours. The Lynx also had a full page spread in a Sears Holiday catalog. Other press to feature the Lynx includes Business Week and TV Guide.

Atari Corp. Sues Nintendo

Atari has filed a legal action against Nintendo and Pepsi-Cola for their recent ads in People Magazine. The ads showed the Gameboy with a super-imposed color picture of the Mario Brothers arcade game. Pepsi has issued a press release clarifying that the Gameboy is a monochrome machine.

Nintendo also made big news in The Wall Street Journal with a report that the US Justice Department is investigating Nintendo for its business practices and the monopolization of 80 percent of the video game market.

As of MidDecember, Atari stock was $9.25 per share with more than 100,000 shares traded each day on the 13th and 14th.

New President Named

Back at Sunnyvale, changes are being made at Atari headquarters. Mike Moran has left Atari after spending only a few weeks as President of Atari Computer. David Harris has been moved over from the Atari Calculator division.

New Developer Rules

Charles Cherry, Atari's Developer contact, is busy re-registering Atari developers. There is now a two-tiered support system for commercial developers and public domain programmers. Commercial developers will receive more support from Atari with lists of registered owners, dealers and user groups, updated quarterly. Atari also plans to work with commercial developers and putting them in contact with foreign distributors.

PD software programmers obtain the normal developers kit and the monthly newsletter, but not access to the Atari databases. For more information on the new developer requirements, contact Charles Cherry at (408) 745-2000.

Bob Brodie, Atari User Group Coordinator, stated on-line that his boss, Bill Crouch, is supposed to be working on new and less restrictive Atari dealer requirements. We had no more information on this at press time.

Atari users in Michigan will be able to question Bob Brodie in person on recent developments and topics. He will be addressing the Ann Arbor Macintosh club, and will be speaking to all interested Atari user group members at 1 pm on the 18th in the Anderson Room at the UofM student union.

Online News

BobPuff was recently made a SysOp for CompuServe. Bob Puff may be familair as the programmer of BobTerm and MyDos. Well done, Bob! He is a regular in the Sunday Night Conferences on CIS.

The Power of Advertising

by Tim Holt (El Paso)

The ads were eight pages long in a national magazine. Slick, glossy, well made. The ads showed people from all walks of life applying the uses of the computer.

There was an underwater "ocean engineer" that uses his computer to drive remote controlled submarines, a musician that composes her work on one, B.B. King, the jazz legend, a kid playing "Falcon," a computer programmer, and a novelist. All sitting in front of the computer, all happy as pigs in mud.

And the magazine the ad was in wasn't a poorly distributed monthly, it was Newsweek, with circulation in the millions. The week before, the same ad appeared in Time, with circulation in the millions. Nice ad. Excellent pictures. Too bad it was for the AMIGA. Yep, Commodore is pushing it's computer in America, to Americans. Yep, they beat Atari again.

Where are Atari's Ads?

Every place in that eight page ad that said "Amiga" could just as easily have said "Atari ST," or "Atari Mega."

Can you control an underwater submersible with the Atari? Yes. Can you compose music on the Atari? Yes. Can you play great games with kick-ass graphics on the Atari? Yes.

Does the Atari have a legendary musician that can tell the public how wonderful the computer is? Yes, several come to mind, but Mick Fleetwood is the obvious choice. Can you write a novel on the Atari? You bet your LYNX you can.

So, since the ST line of computers can do all those things, why is the Amiga the computer in Newsweek? Beats me.

Reasons Not to Advertise

In 1988, Atari said that they didn't advertise because there was a DRAM shortage, and there shouldn't be advertising for computers that were not there. Ok, I'll buy that.

Then 1989 came along, and they said they didn't advertise because the dealer base wasn't in place. Now 1990 is upon us, I wonder what the excuse will be this year?

I like the Atari excuse that the dealer base is not in place. That is an excuse that they can use ad infinitum. "Well, we still don't have a sound dealer base in Minot, North Dakota, therefore we cannot start a national ad campaign."

I wonder if they ever looked at it from the other side of the coin: Perhaps dealers are unwilling to sell the Atari *because* there is no national ad campaign. Who the heck wants to support and service computers that noone has ever heard of? Would *you* open up a business without ever telling anyone you were there? Of course not.

If I were a potential dealer, I would not be attracted to a company that places its emphasis on a foreign market. If I was a dealer looking to start selling a new line of computers, I would swing to the Commodore camp. They advertise.

A while back, the owner of the local Atari store wrote an article that appeared in this magazine. Part of his arguement on why a computer company does not advertise is that a multi-million dollar campaign would increase the price of the computer. A valid point.

We all know that there is no such thing as a "business expense," and that all costs to a company are eventually passed on to the consumer.

While this is true, he missed a vital other point: Suppose Atari spent 1 million dollars on a national ad campaign like the Amiga's. That million dollars would be passed on to the consumer.

Reasons To Advertise

But, if the ad campaign resulted in the sales of 33,000 computers (not an unrealistic assumption), the total price to the consumer would be a price increase of $30.30 per machine. If the machine was a 1040, which is going for about $1000 these days, the increase would be 3 percent. Hardly a radical change in price.

If a million units were sold (wouldn't that be nice?), the increase in price would be a whopping $1 per machine! I don't think any serious computer consumer would argue with that kind of inflation.

Besides, any consumer who was unfamiliar with the Atari line of home computers would be amazed at their low price. A price hike of 3 percent would matter little to them. Not only that, but Atari would be selling more computers than it would have done so originally, and with that more peripherals, such as modems and laser printers. The company would be making more money, and so would the dealers just because more product was being sold!

Does Advertising Work?

Then there are those that say advertising really doesn't work. Only if the item is "hot" will it sell. Let me offer some counter thoughts on that.

A few years back, Sega and Nintendo offered new video game systems to the public. Both machines were virtually equal, with some even saying the Sega system had better graphics. Even though the Sega system was supposed to be the system with the better everything, Nintendo sales still sky-rocketed past Sega into God knows where. Was the item hot, or was it made hot by advertising? I think the latter is true. Now, how many Sega ads have you seen in the past few years? Compare that to the number of Nintendo ads. I think you can see the difference.

Advertising Does Work!

I have read reports that the Atari Portfolio has sold over 100,000 units in less than 2 months. Why? Not because it is an incredible technological breakthrough (Dos 2.2??), but simply because the little bugger has been seen in every PC magazine and Atari is actively *advertising* the Portfolio.

Ads have been seen in TIME, Scientific American, The Wall Street Journal and other national publications. Tom and Jim have told me that people have called them asking about the Portfolio after reading about it on an American Airlines in-flight magazine. Called them *from the airport!* People wanted to buy it *sight unseen.* The power of advertising. Surely, Atari can see that advertising works. So, the question arises, why don't they advertise the ST line of computers?

There might be several reasons. Here are some that myself and others have come up with:

> The executives at Atari simply don't understand the market.

Hard to believe that a company that has been around this long doesn't have a sound marketing plan. Hard to believe that Mr. Commodore turned Mr. Atari cannot see that his former comany is kicking some hiney. When the sales figures come in for the year, let's see who sold more computers in the U.S. It won't be Atari. When they have the end of the year corporate luncheon, no doubt they will blame everyone but themselves.

I can see it now : "Well, it's the dealer base coupled with the Federated sale, plus Sig leaving, in addition to the pirates and the burn we took on the DRAM shortage followed by the volatility of the Japanese market, coupled with the first quarter operating loss. I think that covers it all Mr. Tramiel. By the way, we DID save over a million dollars by not advertising this year again." Sam looks up from his caviar and hot dogs and says "Thank you Mr. Junior Executive, you are a true Atari expert. I couldn't have said it better myself."

> User groups will sell the computer for them, because word of mouth is the best form of advertisement.

Suppose there are 1000 user groups in the USA. (I don't know the exact figures, but this number will do.) I will be nice and say that each group has 50 go-get-'em active members. (I hear some of you laughing at that.) Ok, suppose that each and every member convinces three people to look at an Atari. That is a *total* of 150,000 people -- 150,000! That is 4 percent of the total *weekly* circulation of Newsweek (assuming a circulation of 4 million). Even if every member convinces six people to look at Atari, the numbers would still be less than 10 percent of one magazine's total circulation. If only 10 percent of all Newsweek readers read the Atari ad, that is 400,000 people!

If Atari thinks the user groups are the best method of spreading the word, they are only fooling themselves. People by nature believe what is written, and a well done, written ad, reaching millions of people out-does a user group any day. User groups simply do not have the numbers that magazines have. Word of mouth is great, but we don't have that many mouths!

> We don't have the money to invest in advertising.

Wrong-o. If you can do it for the Portfolio, you can do it for the rest of your products.

> We are really not very smart. We are in this for the quick buck, and really don't care what happens in America. Our money and our hearts are in Europe.

I believe that this one is a bit more accurate. Only when Atari believes what we have been saying for years — that there is a market in America for the ST— will they get serious and stop using us as a hand-me-down market for Europe.

So, Atari wants people to buy, but they are unwilling to advertise the product, due either to misinformation, poor market analysis or just plain stupidity.

Whatever the reason may be, I sure hope they don't come crying to the few user groups that are left. We do our part every single month. I hope they don't cry when the number of Amiga user groups doubles. We will all know why THAT happens. I hope they don't cry if the sales of the TT and ST-E are poor and they didn't advertise. Now is the time for them to do their part. It is time for Atari to join the Atari revolution.

From Freedom's Frontier
or
Will the Wall Come Tumbling Down?

Views from a European Correspondent

by Jim Cox (P3ACE)

Atari Alive and Well

I've been tracking Atari's effort to market their computers behind the Iron Curtain. There's no way I could have anticipated the recent political developments, though perhaps Atari did — though I doubt seriously they had more in mind than profits. Clearly, however, they were on the leading edge of a market which will only grow in the months and years ahead as Eastern Europe opens to Western economics. Whatever Atari's motives, their move was a precient one!

The Portfolio in Europe

Just a week ago I first saw the Atari Portfolio in the possession of a very proud and pleased owner. He quickly showed another interested observer and me the memory card with 256K, the small, but adequate fold up liquid crystal display and the automatic shutoff feature.

One surprising thing was that the machine was even smaller than I had pictured it. But even more surprising was the owner, a three star general officer. He had the Portfolio at a commander's conference he sponsored. He used it for keeping his calendar, tracking attendees, insuring the conference was on its time line and for taking a few notes.

A couple weeks later, I had occasion to encounter him in the hallway of his headquarters. He asked me by his office on a duty related subject, but the discussion briefly turned to the Portfolio since we were to discuss a future event, a conference of sorts a few weeks into the new year.

To my amazement, his entire calendar was loaded into the Portfolio well into 1990. He demonstrated a search by date, subject and keyword. Everything was broken down by hour in an established format. He also showed us his traveling checklist, the file card type file-and-search feature and the clarity of the display. Fortunately, he speaks German well, because the entire operating system is in "Deutch."

The memory card, the "gold card" memory cartridges the size and shape of a credit card, provide superb storage for programs as well as data. They contain a lithium battery with about a year of life. But the cards are not cheap. My source indicated about DM 1500 (about $835) bought the Portfolio, the memory card and the cables to drive a printer and permit data exchange with a PC compatible. He also found rechargable batteries did not work as well for his applications as did the alkaline type. But he uses his all the time, literally, and he probably was not discharging the batteries prior to recharging, a sure fire technique for keeping the nicad battery life at a more reasonable level.

The keyboard, contrary to what one might think, was easy to type on and actually works for word processing, though it is a little harder for those of us with fat or inaccurate fingers. All in all, quite a machine.

A MiniDrive in 3-1/2 Inch Format

Do you need a half-height low voltage and wattage disk drive for your ST? One you might be able to operate on batteries? One that will give you 3-1/2 inch format double density storage for your 16-bit machine?

Maybe there is a German-made unit that will do the job for you. The cost is less than $200 with cable and 220 volt power supply. But the requirement is for only 5 volts at low watts so operating using available U.S. power supplies or modifying for batteries should not be tough for the hobbiest. The only caution relates to availability and service, but the unit is so compact and simple that it is sure to operate for a good long time.

520 and 1040STs on Sale

The German versions of these two Atari standards are now being sold on sale in the small town where I live -- it has the best computer store I have seen in Germany so far.

They were selling the baseline 520ST German model for DM 399 (about $225), the same with disk drive for DM 499 ($277) and the 1040ST with monitor for DM 998 (about $550).

The best price I've seen on a U.S. model was $699 for the 520ST with drive and color monitor and $799 for the 1040ST in the same configuration.

Unfortunately, these U.S. versions sold out fast and the German models use a European keyboard and a system which is not totally compatible with U.S. models and NTSC TV systems. Some U.S. produced software is also incompatible!

Take care and great Atari computing!

Piracy = Arbitrary Discrimination

by H. Jake Olbrich (RACC)

Let me tell you a tale my friends. It's long and true. Awhile back, I was a dealer for a company we shall call "J" farm machinery. This was during a time when a lot of agricultural equipment was built so poorly, that whatever you did to it was an improvement. The new machine on the scene was the corn combine. All the major equipment manufacturers had one form or another. As an improvement to the "J" machine, I, along with a step-brother, mechanic and neighboring welding shop, built the first low-profile corn head. Actually, we built four of them.

Competition was tough, and not ever fair. Financing always was, and still is a problem. However, it should be fair, but isn't. The area "H" dealer just happened to be on the Board of Directors for one bank and had a large interest in the other in my area. Many times I would sell a machine to a customer and we would agree on price and terms. The customer would go to the bank and never return. I would call on the customer; "HEY, what happened?" I would see an equivalent "H" machine. Sometimes the customer was too embarrassed to even talk to me. Seems the bank decided that if they were to finance this purchase, then the business ought to be kept in that banking community -- plenty of credit for an "H" machine, no credit for a "J" machine.

If, as sometimes happened, the farmer decided to use alternative financing for this purchase, and buy from me, then all of his credit at these banks was immediately withdrawn, forcing him out of farming. A neighboring farmer would farm the land, and need new "H" machinery to do it, all financed in this oligopolistic community.

I coined, and others adopted, the phrase: "Never Buy A Binder!" referring to an "H" machine. It had a small negative impact on their sales, anyway. Then "H" made a bad mistake. A third company, "D," had patented their low-profile corn head. Almost an exact copy of my unpatented, never adopted, head I developed for the "J" machine. I had been forced out of business because of unfair financing practices. But the phrase "Never Buy A Binder!" hung on and eventually had considerable impact.

To improve sales "H" made a too-exact copy of this low-profile corn head. Others made marketing agreements with "D," at great expense, to use this technology. I said nothing. "D" sued, collecting millions of dollars from "H," which eventually forced "H" out of business. I said nothing. If "D," 'The Kettle' wanted to call "H," 'The Pot,' black, I could only agree.

Of course I could prove that "D" never had an enforceable right to the patent but still, I said nothing. Also please understand, the "D" dealer never used unfair financing methods against me. Ironically "J" purchased "H."

What does this have to do with Computers? Well, change a few names, substitute Atari and the story is the same. And the story is still happening today. I guess it's evident that I have strong feelings about piracy. I also have strong feelings about arbitrary discrimination. Even stronger. And there is a way to overcome this total withholding of programs from the Atari market. I do not endorse it or practice it.

This is what could happen. It is illegitimate and probably very illegal. And it's also as bad as what has happened to me. If every Atari owner obtained -- not purchased -- copies of the highest selling programs for IBM and Apple and made as many copies as they could, it would not be piracy for profit because they would not be able to use the programs. Then, simply put these pirated copies on the doorstep of every IBM and APPLE user. Do not use the mailbox as the post office also takes a dim view of civil disobedience.

The IBM and APPLE user will certainly not purchase what he already has in hand. What is not purchased, the IBM and APPLE programmer cannot sell. Ergo, the IBM and APPLE markets no longer warrant the time and money to market programs for those computers. I do not endorse or support the above, but do you see now why we ATARIANS have lost all the third party support from software companies? Is it just piracy, or does an oligopolistic community's arbitrary discrimination also cause good programming effort to go to waste?

Obviously, we'd all need Apple and IBM compatible type machines to make these copies, so then where would we be? I would like to see the terrific "World of Atari [Power without the Price]" survive. REMEMBER: DON'T BUY A BINDER!

The Right Brain

by Paul Stampfli (El Paso)

Hey folks, It's me again. As I write this in mid-December it's wonderful weather we're having out here in the beautiful Southwest.

It was about 70 degrees yesterday (Sunday), and the wife and I decided to go for a little horse-back ride and try out the saddles that we just got back from the repair shop. It was wonderful. And had it not been for the gale force winds driving a wall of sand, grit and half the garbage from the coast, it would have been perfect.

Looks like another beautiful brown Christmas in the making. But enough of the personal stuff, what's happening in the world of Atari??? Excellent question, and if you get the answer right, you get to be part of Atari's executive management for a day. Which is about twice as long as most of those guys appear to be holding the jobs anyway...

Thoughts on PC Ditto II

I just got a couple of online magazines and PC Ditto II is finally starting to ship. If it's any consolation, it looks like it's been worth the wait. Most of the MS-DOS diagnostic tests seem to make it a NEC V-30 running in the 9mHz (plus a bit) range.

I'm waiting for mine with baited breath. How well it performs and what it will do is going to dictate what I do with the Atari in the future.

Our last club meeting was a gas! Tim and I, with the help of about half the membership, installed a Tweety Board during the meeting. We didn't kill the machine and it worked! Talk about miracles!

Support from Practical Solutions

It was part of the customer support program offered to clubs from Practical Solutions. I can't commend these people enough for their support of the ST. We all thank you!!!

We also talked about naming our club. This is a Radical Idea. We've been in existence two years now and getting a name might make us pretty formal! Tim likes the "Atari ST Club of El Paso"; I like "The ST Computer Club of El Paso."

The only reason we want to name the club formally is that it's being printed in the paper as the "St. Club of El Paso." Which makes us sound like either a church (right!), or a Street gang (that's even a bigger fantasy than the church!).

Thanks, Gordon!

I have to confess, I've been reading again. I read the Revolution Handbook, Tim Holt's article about the Power of Advertising and Gordon Totty's (MACE) *Excellent* article about being in a large club.

I especially want to thank Gordon for not taking the easy way out and just writing a "shoot-down" article. The piece was well thought out, well structured and presented an angle of view I hadn't appreciated before. I surely hope that Atari gets the message. But somehow I doubt it.

Atari is in the driver's seat here and I don't know how they look at the future of the ST.

On the one hand, its life span, about 4-5 years now, is about the maximum to maintain a front line system in the computer world. Now, before I get a lot of folks going ballistic on me, I don't mean that it won't be *usable*. I just mean that it will become a second class computer, probably behind the TT in the Atari line.

Downward Compatibility

On the other hand, the advance stuff that I've seen says the TT will be downwardly compatible with the ST so that base of software shouldn't be lost. But much like the MS-DOS stuff that is written to perform at 4.77 mHz in 256K of RAM, it's unlikely that anything earth shattering will be written for it.

On the other hand, with strong third-party support, like Practical Solutions, GCR, Ditto II, PC Speed, and others, this system will run very strong well into the 90's if the users stay flexible.

I heard a *rumor* the other day that a very prominent ST third-party developer was busy working up a TT upgrade board for the ST. Much like the 80286 and 80386 upgrade boards for the standard MS-DOS PC's. Therein lies the future of the ST. In the ability to upgrade and grow without undue and overburdening price to the consumer. Notice that Atari's idea of an upgrade is to trash the old system and buy a completely new system from them.

The Revolution

Donald A. Thomas, Jr., did a great job on the Revolution. It was well thought out, well planned, and if executed correctly will generate serious publicity and sales of Atari computers. Of course some of the ideas, I'm sure, are pretty "tongue-in-cheek," but we could all have some fun with it. But do I fully support it? Yes and no.

The bottom line is that what we have is technology that is fairly old in the computer world. We have a company that is on top of sales in Europe, but gives the American customer the dregs, lies and false hopes. (That's their right, and is probably the best business choice they could make.) The question is "Should we support this company?" I don't know. I love the computer, and I love the third party support, but the company makes me angry 'cause I feel "slighted" and ignored. Do I want to support such a company? No. Do I want the computer to stay viable and strong? Yes.

So, therefore, I will have to indirectly support the company. But my main support is going to go to the developers of "those wonderful toys." When I talk about the ST, it will be as a less costly, and more flexible, alternate to the Mac and the MS-DOS machine. It will be as a platform for GEM, Practical Solutions, Ditto, PC-Speed, GCR, and desktop publishing. The fact that it's an Atari will be absolutely the last thing I talk about.

I would support the company a lot more if they would support me more. As it is, I'll give them exactly what they've given me. That's why I want to keep "Atari" out of the club name.

The Reviews Are In!

"... If you own a hard drive ... then RUN, don't walk, to your nearest Atari dealer and ask him to order DIAMOND BACK from Data Innovations, Inc."

Victor T. Albino, ST World

"...The overall winner has got to be Diamond Back...it creates GEM compatible disks at image backup speeds...This is the one I use, and I use it a lot. It's Dependable!"

LeRoy Valley & Ron Robinson, ST Informer

DIAMOND BACK is packed with features, from its custom format/verify routines, to its use of script files, it's in a class by its self. Here are just a few of the features packed into DIAMOND BACK: • EASY to use completely GEM interface and online help • File compression & encryption • Selectable incremental backup, by date or archive bit (using TOS 1.4) • Load/Save backup configurations • Automatic drive switching • Backup/Restore any number of drive partitions, directory paths, single directories, or even specific files or types of files • Recreate the original tree structure or specify a new directory structure during restore.

Feature for Feature, DIAMOND BACK offers the hard drive owner, more POWER and FLEXIBILITY than any other backup program currently available for the Atari ST/Mega computers.

FULL COUNT BASEBALL & COURT SIDE COLLEGE BASSKETBALL

Full Count Baseball & Court Side College Basketball are games for the true sports lovers in the family. Both are statisticly based simulations, which we believe offer the sports fan the most accurate statistical game play of any sports simulation for Atari computers. Full Count comes with teams from the most recent season plus 52 great old time teams and Court Side includes 286 teams from the most recent season plus 70 all-time great college teams.

Diamond Back, Full Count Baseball and Court Side College Basketball, are Available NOW. Retail price for Diamond Back is $39.95, sports games retail for $39.99 (each). Dealer inquires welcome.

NET$WARE

by H. Jake Olbrich (RACC)

[Editor's Note: The NET$WARE concept is designed to help user groups, sysops and 8-bit software programmers. Basically, the user groups and sysops participating in this project become distributors for the NET$WARE software. In exchange for this work, the clubs (or sysops) receive a percentage of the money from each product sold.]

I have just received permission from C. Wilson Anderson to market the program Syllable.Net This will be the December NET$WARE program. Price $25.00. 10% to sysops and 10% to user groups participating. Please have all checks made out to NET$WARE. Hopefully this will acheive two things: control of piracy and income to user groups and sysops. Please keep track of all downloads and instruct user group disk librarians to also keep very good records of copies.

In order for me to remit your commissions, have all downloaders and purchasers at club meetings send their name and name of the club or sysop who should get the money. The current program for November is on Camille. This is the spelling program.

Downloads from sysop to sysop are free. Hopefully we can all share in this venture.

If your club, like RACC, depends on monthly disc sales to keep their club finances healthy maybe this can pick up the slack with Antic going to disk only versions.

Are there other programmers out there who have programs, preferably educational, that they are interested in selling. I believe this can help keep Atari alive. At least it can help defray the monstrous expenses sysops had to bear on their own.

See Spelling.Doc and Syllable.Doc for the programs' operations in the NET$WARE library. Sysops are instructed to remove the program itself after 60 days. Documentation and other pertinent messages are, of course, exempt from this requirement.

For more info on NET$WARE, contact Andy Learner, RACC BBS Sysop at (815) 397-5318 or call the Camille 2000 BBS at (815) 973-5327.]

IS THERE A TACTITIAN IN YOU?

by Tim Feenstra (GRASS)

Have you ever been watching a war movie and wondered how you would react if you were the commander? Perhaps the movie commander made some real bad choices that you could see by watching the movie.

With the aid of your Atari computer and one of the multitude of military simulations available, you can try your hand commanding forces at any level. Commonly called wargames, these simulations are entertaining, challenging, sometimes frustrating, and history can be learned and understood from them.

Many of them are based on some historical confrontation. History can even be changed if you have the drive, desire and sound tactics required to do better (or worse) than the historical outcome.

Wargames come in a wide variety of styles and types, both two player and solitaire, covering most any level of command, in many types of conflict.

One aspect common to them all is the need for a sound strategy and the ability to get the most out of the forces you command. In a two-player game, you must have another human to play against, while in one-player games you can play against the computer, which does not make many errors for you to take advantage of.

Play against the computer and you get a feel for the historical aspect, as most programmers will include these as part of the computer's intelligence. Of course, if you vary too much from what the computer "expects," it can sometimes be tricked into doing something you want it to, which can bring you a victory.

There are too many different styles and types of war games to give an account here, but generally, they have an "orders" phase followed by an "action" phase where the orders are carried out to the best of your units' abilities.

The exception to the phase type play above are realtime games in which you issue orders while the action is going on. One realtime version allows you to break to an orders phase only when you wish. In the realtime games without an orders phase, you do not have much time to make those important decisions, for the computer does not stop the action. Hesitation in this case can be disastrous.

All military services have a chain of command. This chain starts at the President or Dictator, down to the General's Staff or High Command, followed by the Theatre commanders -- Generals in charge of specific areas or fronts -- followed by Corps Commanders.

A Corps consists of several divisions, each with a commander, who directs the action of the Regiments in his division. The Regiments in a Division have a number of Battalions, each with several Companies. Companies are made up of Platoons, which are made up of Squads. Lastly, Squads contain a gun and its crew or individual vehicles or perhaps a dozen or so infantry.

Each and every unit in this chain has its own commanding officer, which gives you the chance to command at any level you might wish to.

For an example, a Theatre Commander (call him Field-Marshall Putz) wants a certain mortar squad (2 or 3 mortars and their crews) to fire at a certain crossroad near them. In charge of the mortar squad is a Sergeant (call him Sergeant Hardwork). For the order to fire to get from Putz to Hardwork, it goes down the chain of command.

It would read like this: Theatre command (Putz) to Corps command to Division command to Regiment command to Battalion command to Company command to Platoon command to Squad command (Hardwork).

Now that that is over, and you all have had enough of the service life already, think of it as a ladder. A wargame can place you on just about any step you wish, from Field-Marshall Putz to Sergeant Hardwork. The higher up the ladder you get, the more remote the use of individual squads becomes.

In the above example, the squad that actually did the bombardment would probably be chosen by the Company or Platoon leader. A theatre commander could not possibly keep track of every squad under his command, let alone issue orders to each and every one.

The play mechanics of a wargame are such that you control units from the perspective of the scale level. In a strategic level game covering the Russian front in WWII, you command corps (several divisions) or individual divisions. The smaller units that make up the divisions are invisible to you and are handled totally by the computer. This gives the perspective of a General or Field-

Marshall, who gave their orders to division commanders.

This brings us to the different levels, from Strategic to Tactical, and several combinations in between. Strategic commands are generally considered to be those given at the larger scale, such as a General would give to a division or a Field-Marshall would give to his corps. Tactical commands are those that a Captain or Major would give his company or platoon, where he directs them right into contact with the enemy, deploying them as he deems necessary and using the tactics he feels will allow him to emerge victorious.

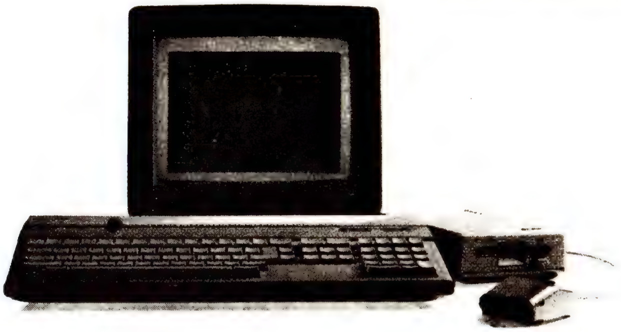
Strategic level simulations can include many factors that are not possible in the smaller scales. Supply is usually the important one, as well as a line of supply back to your rear area. Artillery allocation, reserves, reinforcement commitment and, in some instances, even the type of production of your cities factories are part of a large scale game. These games may cover a time frame of weeks, months or even years, and will usually require a large investment of your time to complete.

Tactical level simulations will get you closer to the feel of battle, and will generally include a morale factor that can really cause you fits if you don't rest units that have been taking a beating. Line of sight, hidden units and the proper deployment of the forces are also of importance here.

We'll cover some specific games later, but first an example of strategic and tactical level commands. In December 1944, the Germans launched the Battle of the Bulge. A strategic level game would include several corps of 3 to 5 divisions (usually 1000 to 1500 men each division) and cover the entire Ardennes Forest area. Your objective would be to get some strong, well supplied divisions as far into the enemy rear as possible before the enemy had time to react, and keep a line of supply open to those divisions for as long as you could.

The siege of the city of Bostogne, part of the Battle of the Bulge, with company or platoon size units would give you a tactical level simulation where you deploy the units around the city and try to capture it (the Germans did not succeed). Tactical games come with time frames of hours, days and occasionally weeks. Many of these can be completed in just a few hours while; others might last 20 to 30 hours.

Wargames come rated as beginner, intermediate or advanced, which rates the complexity of the mechanics and decisions required to play as well as the depth of realism. Short games usually fall into the beginner rating, while the long campaign games are almost all advanced. Intermediate games are a mixture of elements from both and are probably the most enjoyable to the average player. Playing time for intermediate wargames varies greatly -- as short as an hour or two or as long as 20 to 25 hours or more.



Don't Be A Solitary Atari.

The largest and longest standing group of Atari® users in the world shares its problems and solutions online every day in CompuServe's Atari Forums. And you can join them.

Find the latest software, like the new desktop publishing program for the ST. Learn how to run Macintosh® and MS-DOS® programs on your Atari. And pick up helpful game tips from experienced players.

Need technical help? Atari personnel and most third-party software and hardware vendors are online every day. You can even provide recommendations as they develop new programs and products. There's no better way to get more out of your Atari.

To join CompuServe, see your computer dealer. To order direct or for more information, call 800 848-8199. In Ohio and Canada, call 614 457-0802. If you're already a member, type GO ATARI at any ! prompt.

CompuServe®
An H&R Block Company

One last thing before we get into some games, I can hear most of you saying "Well, aren't those darn things really hard to play?" No!! It is like Chess, learning how to move the pieces is easy, but getting good at the game takes practice, lots of practice. I have played about 60 or 70 different war simulations from beginner to advanced, and have not come across more than a half dozen or so that require more than one evening's manual reading and experimenting to pick up the mechanics. Don't say you can't until you try one.

Warship

Naval engagements are my favorite type of battle with a special appeal for World War II carrier warfare, so we will start some game specifics here. "Warship" from Strategic Simulations Inc. (SSI) covers WWII surface combat in the Pacific Ocean. It may be played by 1 or 2 players and includes a good construction set to create your own battles, as well as four ready-to- play historical situations.

You command up to 20 ships in either division or ship mode. In division mode, your ships are divided into task groups (up to 9) and orders are given to them as a group. This gives the feel of being the Admiral in command of a task force out to destroy the enemy fleet. You tell them when to fire and where to move at what speed, but they pick their own targets.

In ship mode, you assume total command of each ship, control the guns and torpedos, and can assign priority targets. This game plays realtime, stopping only when you wish to give orders. The game clock runs in 2 minute pulses covering from 1 to 4 hours of the surface engagement. A single game can usually be completed in one evening. With 15-20 ships in ship mode, it can become lengthy though.

The construction feature allows you to create your own battles using ships from 79 available classes. You can alter almost every aspect of each ship, thus creating virtually any vessel from the WWII era. You can create your own map, with land, islands or shoals and set a weather level which affects the visibility...you must see the enemy to shoot at them.

Weapons available include five types of torpedoes and about 30 different guns from the Yamato's 18.1-inch monsters to 3-inch pea-shooters good only against thinly or unarmored targets. You can put any weapon on any ship you wish, armor it to your liking, and face any force you like. Extremely flexible, it includes ships from the U.S., England, Holland and Japan. The construction set makes the game one of the best naval simulations available.

Battlecruiser

If you prefer to fight in the Atlantic, "Battlecruiser," also from SSI, plays identically to Warship but includes French, Italian, British, and German ships. Battlecruiser also includes a WWI game, with German and British forces in the Atlantic.

It should be noted that you can play either side and mix any nationalities to form any fleet you want in either game. Put German and Japanese ships together if you want...use a German BB (battleship), modify all its weapons and armor to that of the I.J.N. Yamato and let her accompany the Bismarck on its fateful cruise. Like I said, the games are very flexible.

These 2 games are beginner to intermediate level. They make good starters for the new wargamer, as well as a challenge to the armchair Admiral. They use simple menus for commands and are easily learned in a single sitting. Victory in an evenly matched engagement, however, will take some time. To win with an outnumbered force will require the best tactics you can muster.

Carrier Force

"Carrier Force" is probably the ultimate Pacific carrier warfare simulation. An advanced game from SSI, it covers four famous battles fought early in the Pacific war between the U.S. and the Empire of Japan. It is also menu driven, meaning the mechanics are fairly easy, but the realism involved means there is a lot to be done to do it right.

There is a multi-level command here — you are not only in command of the various task forces, but you also command each air mission from both carrier and land bases. The main weapon is, of course, aircraft. These planes have a limited fuel supply. The computer will not care if you fly your planes too far and run out of fuel before getting back to the carrier or land base.

The enemy must be found before you can deal with him, so you also command search missions using seaplanes or other aircraft. Once you know the enemy forces position, quickly turn your carriers into the wind (that's right, even that is included), which can change every hour, and launch as many planes as you can.

Each carrier and base has an operation limit representing the number of aircraft that may be launched or landed every hour. You must also have your planes readied. It takes an hour to ready aircraft, an hour you cannot afford if the enemy spots you first and your planes are not armed for a strike. You also command CAP aircraft to protect the carriers and bases from enemy planes.

There is the possibility of surface combat in this one, but the main purpose is to do unto the Japanese with carrier borne aircraft, then split before he returns the favor. One or two people may play this one, but a single player may only play the American forces with the computer doing the Japanese part.

Orders are given in a series of menus, which starts with task force orders. Divide and join task forces, then change heading followed by the aircraft orders. First, ready aircraft, then launch aircraft, then fly each mission (up to 20). If there are planes to land, they will be landed before the air mission command phase.

After all these orders, a realtime combat phase shows you how you did.

Each turn represents one hour, and can take a half hour or more to complete if you are in the thick of battle. With each scenario being 3 or 4 days long, one of these games could keep you occupied for hours.

Did I tell you that you cannot go back to an order menu once you move on to the next one? If you forgot to do something (like ready your planes), tough. This was the second game I ever bought, and was my favorite until I got one that covers the entire South Pacific during '42-'43.

Coral Sea, Midway, Eastern Solomons and Santa Cruz were important battles for the United States. If you are an aircraft carrier fanatic, you should check this one out.

Broadsides

Another naval simulation that merits listing is "Broadsides," a joystick controlled battle in the golden age of sail. It plays realtime in a somewhat arcade style, but the tactics are anything but arcade. It plays fast, is easy to learn and makes a great fill-in for those nights you just don't want to get into some major venture. With a pretty good "create game" feature, this one has only one flaw -- a boarding phase that can only be described as arcade.

Another sail age game that is easy to learn is "Clear for Action" from Avalon Hill Game Company, which would be described about the same as Broadsides.

You might also want to check out one of the many sub simulations available for the Atari. I have Silent Service and enjoy an occasional clash with some Jap destroyers over the sinking of a tanker.

That is naval simulations in a nutshell. There are others, but not nearly the selection that a real naval buff would like to have. There are some other games that include naval forces, but they cannot be described as purely naval in intent.

So, if you are getting tired of playing Pac-Man for the 23 millionth time, enjoy a good challenging game, and have a desire to go to sea, try one of these naval simulations for some good, solid enjoyment and frustration.

In the next segment we'll move to land and see what's available there. It is a lot more than you might think. Happy hunting and have a good battle.

FA•ST

" ICD sells a superb, excellent, wonderful tape backup unit. I love mine, and it's saved me any number of times.. There's nothing else like this in the ST world; priceless and fast."
-Dave Small, Gadgets by Small

" Using the ICD Tape Backup was surprisingly simple and faster than imaginable. It was so fast that I doubted it was real."
-John Nagy, reviewer for Computer Shopper

" The ICD FA•ST Tape system is a dream come true. The hardware works flawlessly, and the software is incredibly flexible and easy to use...it's simply the best way to back up your hard drive."
-Charles F. Johnson, Codehead Software

ICD has been backing up Atari users since 1984. With hard drives, host adapters, printer interfaces, and the new FA•ST Tape Backup, ICD offers you more! Call us for information on our products. (815) 968-2228

IN YOUR DRIVE 25

by good ol' Chet (ACCD)

Golly pollywogs, does that opening seem dull! The price you pay for all this wonderful typeset and slick printing is that you've gotta make your heading Real Darned Conspicuous.

You noticed in AIM #12 that the "dialogue" opening ("Hey, kids! What time is it?") ended up in the main body of text. This is called clarity and is required when you're communicating to a wider audience than The Usual Gang which knows your idiosyncrasies. And, hey, my customary closing of "Jeep!" disappeared! What will the Popeye fanatics of the world think?

Not that any of the above is that important, but we got a whole paragraph out of it!

So here we are again, and here it is the day of deadline and I'm only now finishing up this IYD. Christmas, and all it represents (end of the year paperwork, dozens of NCOs wanting to go on leave, retirement ceremonies, and emergencies — and, at home, shopping, shopping, shopping! Arrrggghhh!!) has kept me from doing ANY writing the past few weeks. Mike (our ACC.D editor) is probably ready to throttle me, and Pattie 'n' Bill (AIM) will probably be right in line behind him.

Sometimes, I know exactly how an Atari dealer feels.

Mangled Baby Ducks

Now 1989 is behind us, the year that was supposed to be "the year of Atari." Ah well, better luck next time. We heard literally hundreds of MacIntosh commercials on radio (the most underestimated advertising medium) and saw several different Amiga commercials on TV.

Did Atari really advertise its computers at all? I heard rumours of television commercials — when did these air? At 3 AM on ESPN or some UHF station? Did *anyone*, other than the most dedicated of Atarians, see these?

The Game Boy from Nintinduh proved to be the hit of Christmas. Where was the Lynx? The MacIntosh laptop finally arrived, and suckers (there's one born every minute) waited in line to pay five times its worth. Where was the STacy?

Atari is posed to try to take the business market with the TT. I won't hold my breath.

We have always had this love/hate relationship with Atari, from the days when the 8K 800 was released. The machines have always been the best for the price, and the support to users was better than average. But the support to dealers, distributors and developers has never been good, and it has been "curiouser and curiouser" these last few years.

The fact that Atari is still alive, and could still easily make a deep inroad into the American market, shows just how healthy the machines, the users and the users' groups are.

Bob Brodie's appointment as User Group Coordinator, the Portfolio and preliminary publicity for the TT all look good— but looks can be deceiving. Atari could fall again.

Well, as I said back in 1984, Atari the Company could die off tomorrow and I *still* would have the computer power I need and want, plus all the software to do the jobs I want (at the speed I want). I'm prepared...I'm hoarding software. Such as the following:

Study 'til You Drop

A place called Skills Improvement based in Aurora, Colorado puts out a series of products which might seem of limited interest, but bear with me. If you are an enlisted member of the Air Force, or even if you could use help studying for more mundane written tests, you could find no better study aids.

Their "Generic SKT" program permits you to create flashcards on your screen or print them to paper. It doesn't include questions, but the documentation, though scanty in all other places, gives *excellent* tips on how to extract sample questions and facts (called "keynotes" for no discernible reason) from your study materials.

I've now used the Generic SKT program for a couple of tests, and was surprised to find that many of the questions I'd culled from my references actually showed up on the tests!

It thus saved me many hours of study, helping me focus on specific questions and topics. As a person to whom time *is* money — perhaps even *more* valuable than money — this timesaving study program is worth more than the $39.95 + postage.

The Generic SKT program is available for the XL/XE computers (where it runs INCREDIBLY slowly!) or for the ST (which runs faster than a speeding bullet). Each version is priced the same, and each version uses a joystick port "key" or "dongle" — whatever you wanna call it.

More Monsters

Most arcade games are mindless, twitchy things and I grew tired of the genre long ago. That's why the Nintendo craze just amazes me; so many nice graphics, so little difference in style. Yet there's one game which caught my fancy precisely *because* it determined to be mindless. That's Rampage, where you play a giant monster and generally tear up things.

Rampage is little more than a rip-off of the classic "Crush, Crumble, and Chomp" (itself a direct steal from the boardgame "Creature that Ate Sheboygan," which stole its style from "Ogre"...we're *really* going back a few years now!), but requires less strategy (and brains). Occasionally, you'll turn into a human geek, but generally it's just smash, smash, and more smash.

After a rough day at the office, Rampage is a perfect cool down. Sadly, it's not available for the XL/XE or ST computers — strictly 2600 or 7800 owners. At - times, there IS a place for mindless, twitchy things.

[Ed. Note: Actually, Rampage is available for the ST and is marketed by MediaGenic. See the Sept. '88 issue of Michigan Atari Magazine (going back a bit!) for a review of the ST version written by MACE's Bill Boles.

Pretty Pages

We have the newest PageStream (version 1.8) in hand, and if it does half of what its manual claims, it outclasses the MacIntosh desktop publishing kingdom at a fraction of the cost. However, it requires a double-sided drive, so I'll need to transfer the disks over to 5-1/4". (My system is a single-sided 3-1/2 drive and a double-sided 5-1/4 drive.)

We'll tell you more next time, but I can let you know that the manual is now really friendly. Learning something from wargamers and (possibly) Timeworks, Soft-Logik has included a Quick Start section for people who hate documentation. And the entire manual was prepared with their product — it seems obvious, but many publishers don't seem to have that sort of faith in their own product. Soft-Logik does, and you can see from this manual just how powerful a tool PageStream is. Next month, we'll let you know if it's easy or not!

Shut Up, Chester

Can I stop now? I mean, not only is Christmas killing my "spare" time, but I have two strep throat victims to take care of (wife and oldest daughter), snow to shovel out of the driveway and I have to send this to Mike before 1700 hours. Book 'em, Dano!

Jeep!

Go ahead. Punch it.

SPEED
LIMIT
8MHz

For the ATARI 520ST, 1040ST, MEGA and STACY.
Step a generation ahead with **TURBO16** by Fast Technology. The **TURBO16** accelerator can move your ST into high gear. Upgrade your ST and achieve *up to double the speed* in some applications.

Take Your ST Past Its Limits.
TURBO16 will *dramatically* increase your desktop performance. Complex illustrating and page layout is no longer a *drag, click and wait*. **TURBO16** will increase your ST's speed from 8MHz to a *blazing* 16MHz. A state-of-the-art 16MHz processor and 32k high-speed cache memory add the power that lets you *soar*. **TURBO16** is fully compatible with standard ST software, including *Spectre 128* and *pc-ditto*, and **TURBO16** makes games *fly*. **TURBO16** has a far greater effect on productivity than a hard disk, and at **$299 suggested list**, a far lesser effect on your wallet.

Easy To Install, Easy To Use.
TURBO16's installation requires only the removal and replacement of your ST's 8MHz 68000 chip, and connection to the ST's MMU chip 16MHz clock. That's it! The low profile package will not interfere with other upgrades, and **TURBO16**'s special features optimize your ST's operations. **TURBO16**'s speed can be controlled by way of an optional, dealer-supplied hardware switch, auto folder program or desk accessory. Take full advantage of your ST's power with **TURBO16**. See your Atari dealer today, or contact Fast Technology.

TURBO16 is a trademark of Fast Technology. **Atari** is a registered trademark and **ST**, **520ST**, **1040ST**, **MEGA** and **STACY** are trademarks of Atari Corp. **Spectre 128** is a trademark of Gadgets by Small, Inc. **pc-ditto** is a trademark of Avant-Garde Systems.

We won't tell.

FAST TECHNOLOGY P.O. BOX 578, ANDOVER, MA 01810 PHONE: (508) 475-3810

Real Programmers Don't Use Pascal

Submitted by ACCD

Note: This was found on a UNIX system in 1983. Some things may have changed since then, but most hold true even today.

Programming Tools, Part III

What kind of tools does a Real Programmer use? In theory, a Real Programmer could run his programs by keying them into the front panel of the computer. Back in the days when computers had front panels, this was actually done occasionally.

Your typical Real Programmer knew the entire bootstrap loader by memory in hex, and toggled it in whenever it got destroyed by his program. (Back then, memory was memory — it didn't go away when the power went off. Today, memory either forgets things when you don't want it to or remembers things long after they're better forgotten.)

Legend has it that Seymour Cray, inventor of the Cray I supercomputer and most of Control Data's computers, actually toggled the first operating system for the CDC7600 in on the front panel from memory when it was first powered on. Seymour, needless to say, is a Real Programmer.

One of my favorite Real Programmers was a systems programmer for Texas Instruments. One day, he got a long distance call from a user whose system had crashed in the middle of saving some important work. Jim was able to repair the damage over the phone, getting the user to toggle in disk I/O instructions at the front panel, repairing system tables in hex, reading register contents back over the phone.

The moral of this story: while a Real Programmer usually includes a keypunch and line printer in his toolkit, he can get alone with just a front panel and a telephone in emergencies.
